CONTEMPORARY ART IN GERMANY.

"SENI DISCOVERING WALLENSTEIN DEAD."—[PILOTY.]

IN considering the present state of the fine arts in Germany, we find that while, of course, art has always been guided there by the organic laws which underlie all true art among the Germans as with other people, certain conditions have attended it quite distinct from any thing in the past or present history of art in either England or France. Excepting architecture and household art, which were developed over the greater part of Europe about the same time, after the Dark Ages began to yield to the dawning light of the Renaissance, the arts received little attention in the two nations on either side the Channel, for they were too busily engaged in consolidating the races

and provinces of which they are composed into two great kingdoms to attend to the amenities of civilization; and in each, when these objects had been accomplished, it was literature which first asserted itself rather than art. Foreign artists were called in from abroad to decorate the halls and palaces of Francis I. or Henry VIII., and as late even as the time of Charles I. and Louis XIV. The example of these foreign artists, Cellini, Rubens, Holbein, Vandyck, finally had its natural results, and a desire to give expression to the national tastes and emotions in art forms gradually awoke in the hearts of both these races. But it was not until the present century that either people produced

their best art, excepting possibly in the case of Poussin, Claude Lorraine, Gainsborough, and Sir Joshua Reynolds. And when the great English and French schools finally made themselves felt, it was in London and Paris that they took up their headquarters naturally, and without any rival schools in other cities of either kingdom; and so it has continued to the present day. Whatever art schools may have sprung up in other cities exhibiting more or less promise, it is to London and Paris that we look at once in order to form an idea of the national art. There the government schools are established, there the royal patronage is bestowed, there the great annual exhibitions are held, and thither flock the great army of artists, buyers, and amateurs who sustain and encourage the growth of English and French contemporary art.

But in Germany it is quite otherwise. There is a strong analogy between the art manifestations, as in the political conditions, of Germany and Italy for the last six centuries. Both were long divided into numerous small bodies, governed each in its own way, and presenting a political and intellectual activity entirely individual and distinct, and often full of fiery energy, while possessing in common certain general race qualities. It has fallen to the lot of each to be united at last, in the latter half of the nineteenth century, under one general hegemony. During all these ages the separate states of both Italy and Germany have never entirely lost their individual characteristics or the national energy, which in some cases has been continued, especially in the latter, with an ever-increasing glow, that only serves to give greater strength to the empire composed of these different parts welded together in a solid and weighty mass. But it is to be noted that as in the republics and monarchies of Italy in the Renaissance each had an art school of its own, so in Germany the development of political and intellectual energy in the free cities was accompanied by a strong art impulse. If they did not always show the same magnificent eye for color, the same masterly drawing of the human form, as Titian, Ra-

WILHELM VON KAULBACH.

phael, and Michael Angelo, and other Italian masters, these early German artists at least indicated equal or more vivid imagination, and as deep an earnestness in the pursuit of art. As early as 1360 we find the school of William of Cologne and the Suabian school of Ulm exerting a powerful influence. Art schools sprung up in all parts of Germany, and the period of the Reformation, the most magnificent art period of Italy, was also the most noteworthy among the German states of any that has preceded this century. Hol-

bein the elder was followed by such men as Hans Holbein the younger, Aldegrever, and Albrecht Dürer—a genius not inferior in versatility to Leonardo da Vinci. At this period, too, wood-engraving in Germany was carried to a degree scarcely exceeded at the present day, as, for example, in the engraving of Dürer's "St. Jerome and the Lion," while this art was also brought in to point a satire or a moral, as in "The Dance of Death."

Although, with the reaction following this period of enormous intellectual energy and the Thirty Years' War, succeeded by the War of the Succession and the Seven Years' War, art languished in Germany, it never entirely died out as an active principle in the national character. In the last century the rise of the great composers made it essentially the musical era for Germany at least; but still we observe Angelica Kauffman painting with considerable ability, and Winckelmann writing his masterly work on antique art, followed by Lessing and Goethe composing works bearing on the art question.

Thus we find that at the time when English and French art were just coming forth fresh and full of the vigor of youth, Germany had already produced a great school of artists centuries before, and it could therefore be hardly expected of her, in the natural course of events, to keep pace in art with these great rising schools, especially since upon each was concentrated the patronage of a powerful and united government.

But notwithstanding this, the literary and scientific impulse which found a focus at Weimar, but was scattered more or less

throughout the states of Germany, was accompanied by a revival of the art feeling, which, as we all know, was chiefly developed at Düsseldorf, Berlin, and especially Munich, at the latter place under the auspices of Ludwig I., the late king, the most enthusiastic royal patron art has met since

tion too often from the styles of schools moved by different tastes and opinions and beliefs from our own age rather than from the study of nature itself as it appears to our eyes in our time, were still impelled by a true art enthusiasm and noble aspirations. Nothing low or demoralizing entered into

"HOCKHEIMER."—[GRUTZNER.]

Lorenzo de' Medici. Whatever may now be thought by some critics of the sculptures of Schwanthaler, or the frescoes and canvases of Overbeck, Hess, Schnorr, Cornelius, or Kaulbach, it can not be gainsaid that they were men of great power, who, if too conventional, and borrowing their inspira-

tion too often from the styles of schools moved by different tastes and opinions and beliefs from our own age rather than from the study of nature itself as it appears to our eyes in our time, were still impelled by a true art enthusiasm and noble aspirations. Nothing low or demoralizing entered into

man art would not have reached its present commanding position.

In looking over the field, we find several distinct schools of art still existing in Germany, as in former ages. In no one place, as yet, is there a concentration of the national art culture; for although an empire, Germany is also a confederation of states, each still preserving its individuality. To an American it is interesting to study this phase of Germanic art, because it is likely that, as at present, so in the immediate future, the development of the art spirit in the United States will be rather by States than national. Thus we see, besides the system of art education in the public schools for the purpose of stimulating industrial art, art schools or academies and galleries, supported by government patronage, at Carlsruhe, Düsseldorf, Stuttgart, Dresden, Berlin, Munich, and Vienna, which, although not yet included in the German Empire, is essentially German, and is so treated in all except merely political relations. The union of the old Austrian duchy to the German Empire is considered one of those natural events which must come as a matter of course, being only a question of time. For obvious reasons, the Munich school has been and continues to be not only the most famous, but the best of these schools in the quality of its art. In no other city in Europe, not even excepting Paris, is the art impulse so clearly manifest, although the greater size of Paris, and the longer period that art has been accumulating there as spoils of war and in other ways, present such a vast mass of material that one is dazzled by the magnificence of the display. But although on a much smaller scale, there is enough of the art of the past ages collected and arranged in Munich to satisfy the most craving art appetite, while the number of artists living, studying, and painting there—over two thousand—exceeds, in proportion to the population, the art guilds of any other city. One meets them at every turn, often picturesque enough in their appearance, with black beards and keen eyes, everlastingly puffing the reverie-inspiring cigar, and almost extinguished under slouched hats well-nigh as enormous

KARL THODER VON PILOTY.

as the *sombrero* of the *Adelantado* of the Seven Cities. From time to time they give a great ball in the Opera-house. The one at the carnival of last year was a magnificent affair. The costumes were all of the thirteenth and fourteenth centuries, and in some cases cost over a thousand dollars. For three months before it came off, the managers were busy superintending the arrangements. The person representing the Turkish ambassador came in with a retinue of forty, all magnificently attired. Fritz Kaulbach appeared as Charles V., with

a lady on his arm as the queen. Young Arnim, a brother of Count von Arnim, and a pupil of Piloty, was conspicuous in the gorgeous robes of a cardinal.

The *Kuntsverein* is an art union composed of artists in Munich. They have a commodious gallery, to which every week they send specimens of their latest work. By attending these exhibitions one can form a tolerable idea of what art is doing in Munich, although some of the best artists rarely send to them. At the close of the week the paintings are sent to some other city for exhibition, and a new collection takes its place. The union purchases a certain number of these works, when not exceeding fifteen hundred marks in price. Any one is permitted to become a subscriber on paying twenty marks. At the end of the year the paintings are raffled for, and thus fall to the lot of some of the subscribers, while every one receives an engraving worth ten marks.

Besides furnishing the artists with so many examples of the schools of other ages, the Bavarian government also supports an Art Academy, in which twelve professors give instruction, three for each department of art, and each having a school of his own. Piloty, Dietz, Lindenschmidt, and other leading artists hold these professorships, with liberal salaries, and assisted by a number of subordinate instructors who attend to the rudimental branches of art. The Academy is located in a vast antique pile which was occupied as a monastery until this century. But as it is both gloomy and incommodious, the government is now erecting a new Academy near the *Sieges Thor*, at

an estimated cost of two million florins; it is to be completed in 1878. The expense to the students studying and occupying studios in the Academy is merely nominal. There are no annual exhibitions, as in Paris and London, but generally one is held once in three or four years.

What is and has for a long time been a leading trait of the Munich Academy, is its

ie training in that little Bavarian capital, while many of the best artists now working there are foreigners, or at least from all parts of Germany. Bavarian, Prussian, Austrian, Suabian, Italian, Greek, Hungarian, Russian, Pole, Norwegian, Englishman, and American there meet on a common ground, burying political or national differences, all united by a general emulation for

"BUSH-RANGERS." [F. DIETZ.]

cosmopolitan character. "Art has no country, it is universal," nobly said King Ludwig. In consequence, every encouragement has been held out to induce artists from abroad to study or settle in that city. The natural result is that many an artist, like Muncazky, for example, who has made his reputation elsewhere has received his artist-

success toward a common end. The civilized and art world owes a debt of gratitude to King Ludwig which should temper whatever criticisms might be passed upon the character or policy of the Bavarian line.

When we look at the results of this munificent patronage, we find a vast art activity developed here during half a century, pro-

ceeding from one step to another in progress, until from extreme conventionalism a point in the scale of improvement is reached at last by a thoroughly easy and natural process, where we find the contemporary school of Munich, and we may add also of Germany, holding the foremost position in European art at the commencement of the last quarter of the nineteenth century. Kaulbach, who has just passed away, is the German artist of this century perhaps the best known abroad. Less conventional than his predecessors, he undoubtedly possessed a vast genius; and yet he was weak in color. How few can excel in all the art qualities! Rubens, equally great in imagination, drawing, color, and *technique*, presents an example so entirely alone in the combination of many qualities that we feel how rare it is to excel in all. The works of Kaulbach would be quite as impressive if rendered simply in black and white. Piloty, another artist well known abroad, at least by reputation, comes later; he is still in the prime of life, and in his manner serves to mark another step in the advancing scale of German art. He was a pupil of Paul Delaroche, and is an enthusiastic admirer of his master. Hence we find constant traces in his works of the master, who was, it must be confessed, the superior of the pupil. In even the best works of Piloty, who is pre-eminently a historical painter, there is often perceptible a certain theatrical, stagy effect in the composition which takes away from its naturalness. His "Columbus" offends very strongly in this respect; "Thusnelda at the Triumph of Germanicus," his most ambitious work, is perhaps more satisfactory; while "Seni discovering Wallenstein dead" is more simple, and is undoubtedly a work of great power, although open to criticism in details and color. The figure of Seni is very impressive. An interesting incident in connection with the composition of this painting is told. For several days the artist had been endeavoring to arrange the drapery about the corpse of the dead hero, without suiting himself. At last it was adjusted somewhat to his liking, and he began to sketch it in, when a knock was heard at the door. It was King Ludwig, who was in the habit of walking about the city and the studios as a private citizen. Being a little deaf, he did not hear the remonstrances of the artist, and ruthlessly walked into the newly adjusted drapery, throwing it into disorder. Of course nothing could be said, but after he left, Piloty began to swear and pull his hair with vexation. Suddenly he looked around, and beheld apparent a new fold in the disordered drapery, which was exactly what he wanted. Sitting down at once, he sketched it on the canvas in the shape in which it is now seen in the finished painting.

Piloty has founded a school; he achieved

his fame and influence early; but so rapidly has German art ripened of late years that he has lived to see the sceptre pass from his hand. Such is the fate of all reformers. The genius which entitles them to our veneration, and increases the world's stock of culture and progress, so tends to educate the rising generation that the very efforts which placed them on so high a point aid to carry their pupils still higher and beyond them. We can not, however, ascribe to Piloty original powers equal to those of Kaulbach or of some of the rising school. But there is some grand work, notwithstanding, in a colossal painting which he is now executing for the new Rathhaus, or City Hall, of Munich, for which he is to receive 50,000 florins—a large sum for Germany. It is an allegorical representation of the city, and contains portraits of all her citizens distinguished in her past history. It seems thus far to contain more of his good qualities and less of the faults of his other works. He is painting this scene in Kaulbach's former studio, because his own studio, although a hall thirty-five feet square, is not of sufficient length for a canvas that seems over forty feet long. Professor A. Müller and Otto Sietz are artists deserving honorable mention in a style of color and treatment similar to that of Piloty, that is, as holding a position between the school immediately preceding and that now coming on the field. Of landscapists still painting in that style and well known in America there is a good number, including also animal painters of considerable merit, as, for example, Voltz and Paul Weber. But there is a general sameness in their manner, a lack of character and individuality, prettiness rather than strength, and conventionalism in tone and color, although often combined with real poetic feeling. To this school we are indebted for several hundred repetitions of views on the Königs-see—a wild romantic lake known to most travelers in Germany. But one may have too much even of the Königs-see, and the essential weakness of this class of paintings becomes apparent when seen by the side of works of the new school of art in Munich. Let us be just. We would not say there is not much talent evident in these paintings; but it is talent rather than genius, conventionalism rather than originality; and while the Munich school was producing only such works, it could not conscientiously claim an equal place with the great landscapes and figure pieces of the French school even of the last twenty years.

It is a curious circumstance that by a species of tacit common consent so many of the pupils of Piloty himself should have broken loose from his influence even while studying under him, and, as if unconsciously moved by a certain law, formed a style so different from his own. The chief points

of distinction which separate contemporary German art from its predecessors seem to be the result, to a remarkable degree, of a very careful study of certain masters of the Dutch, Flemish, and German artists of the Renaissance period on the part of a few men who brought to the study a new way of using their powers of observation, and in turn influenced other artists of their own age. It is, beyond question, to this cause that we must attribute the turn given to French art at the time when it began to yield to the influence of Troyon and Rousseau. Rubens, Rembrandt, Ruysdael, Franz Hals, Aldegrever, Dürer, although dead ages ago, still influence art, and have proved to the greatest artists of this century what Homer and Theocritus, Dante and Spenser, have been to modern poets—not sources of inspiration, for no man of genius gains his inspiration except directly from nature, but teachers, directors in art methods, and, above all, instructors in the great truth that simplicity is a prominent characteristic of the highest art, whether in letters or in painting, and that in the expression of the ideal itself there is no model superior to nature. The leading characteristics of the new German school seem to be, therefore, greater breadth in the treatment of details, preferring general effect to excellence in parts of a work, greater boldness and dash, and consequently more freshness in the handling of pigments, the suggestion of texture and substance by masses of paint, and the touch of the brush in accordance with the nature of the object represented, and, finally, a more correct eye in perceiving the relations of colors to each other—the quality of subtle tints in flesh, for example—and therefore a more just representation of the mysterious harmonies of nature, while there is every where apparent a masterly skill in the rudimentary branches of art. These have for long been the distinguishing traits of the modern French school, but they have only recently begun to attract attention in modern Germany, and to those accustomed to the older school it requires a certain degree of art education to perceive the excelling quality of these methods. But connoisseurs or those who look at art in general need to understand that no less than in literature does the æsthetic taste require to be cultivated. Some have at an early period a capacity to appreciate Shakspeare, but to most the growth of their appreciation of him may be taken as the measure of their growth in intellectual culture and life experience. Of course in Germany as in France there are artists who carry the practice of these art methods to an extreme, once they become a fashion and profitable. But we do not speak here of extremists or disciples and imitators, but of masters who originate a style and demonstrate only its legitimate results.

But although so far resembling the French school, there is no reason to believe that the present Munich school is an imitator of that; for in the choice of subjects it is altogether at variance with it, and the leaders in the new movement have never studied in France, and have generally not been out of Germany. The causes seem rather to be as foreshadowed on a previous page. Leibl is one of the originators of the new school, and in the rendering of some of its chief points has no superior. The texture of flesh, the myriad delicate pearly grays and pinks, and subtle lines of light and shadow playing on the human countenance or in the muscles and sinews of the hand, and indicating character, he seizes with masterly skill. An artist who introduces such study of nature and such methods of imitating it into art practice is really great even if deficient in many other respects. In order to understand the importance of the reforms introduced by Leibl and his co-laborers in the field, one has but to visit the new Pinakothek, or gallery, built entirely for the permanent reception of the so-called New School of Painting, that is, of representative works produced by leading Munich artists since the foundation of the Academy. The rapidity of the change is so great as almost to exceed belief. Piloty and Kaulbach, although represented by their finest works, seem already of the past, and they are giants compared with some whose works are there. The contrast is still more marked on turning to paintings by Böcklin, of the later school. That we speak in such terms is not owing merely to the fact that the present school is more new, and therefore preferable. For the best painting in the collection is Wilkie's "Opening of the Will," painted some sixty years ago, and strangely hung in that place. Such rendering of character or imitation of flesh-tints kills every thing around it, and has not been approached by modern German art until the present school came in. Leibl revels in painting the rough-featured, roughly clad Bauers or peasants of the Bavarian hamlets, and the results are sometimes quite marvelous. He can also, if he so chooses, paint the delicate beauty of a lady's hand with a truth to nature that throws enthusiastic young artists into raptures. But he does not often so choose. And this leads us reluctantly to say that the essential coarseness of his character prevents him from being as great an artist as his abilities might otherwise have made him. The greatest artists combine with strength a certain refinement, apparent in their works if not in their manners. Beauty in the ordinary sense of the term has no attractions for Leibl. Even amidst the homely uneouthness of German peasantry, handsome men and comely maidens are to be found. He seems to go out of his way to give us the

most repulsive specimens of both sexes that he can find.

Lenbach is another artist, who, in a style quite different from that of Leibl, is fully his equal in *technique*; if not superior in ability, his canvases give us more satisfaction. He chiefly devotes himself to por-

very careful study of character, and in this respect, at least, reminds one of Velasquez, although his treatment is more that of Rembrandt. Lenbach is fortunately possessed of sufficient means to paint only what he pleases, and will not attempt the portrait of every one who applies. Having decided

"LUTHER BEFORE CARDINAL CAJETAN."—[LINDENSCHEIM.]

traiture, although sometimes making admirable copies from the masters, and ideal compositions, such as, for example, his young herdsman lying on the grass on a sunny day, shading his eyes with his hand, or the three Orientals standing in a magnificent group on the brow of a hill. He makes a

to paint a person, he is not satisfied with one pose, but makes a full oil sketch from three or four different positions, until he hits upon one that best represents the character or individuality of the subject. Thus the results reached are quite marvelous. His portraits of Von Moltke and Liszt are

strong examples among many that might be alluded to; nor is he less successful in rendering the beauty or character of a woman's face. And he does not rest his efforts after art perfection here. He works evenings after effects both chromatic and in *chiaroscuro*, especially by the use of a frame covered with a thin black gauze. Behind this a person is placed in different positions, with the light, also behind the gauze, falling upon him; the effect is that of an oil-painting. His studio, built expressly for him in a garden, consists of three apartments, furnished with a profusion of antique and Oriental objects such as are dear to the eye of an artist, and which often re-appear in his paintings.

Loefer is another of the rising artists of Munich, one of whose paintings at the recent national exhibition carried off a first medal. Seven years ago he was a paper-hanger. Now he has a school for drawing, considered one of the best ever opened in Germany, and in color and portraiture or composition holds a very high position. Victor Müller, who died two or three years ago, while still young, was an artist whose paintings are full of admirable qualities of color, while reminding one of no other artist in style, quiet in effect, yet suggesting nature, while such paintings as "Hamlet" or "Ophelia," entirely free from any thing theatrical, show also that he had a real perception and power of expressing the hidden springs of action which make us what we are. Fritz Kaulbach, a distant relation of the late artist, is also well deserving of praise. In some of his lovely female faces one can trace a genuine feeling after the ideal. Lindenschmidt, a professor in the Academy, is an artist worthy far more extended notice in the rendering of character, especially in historic compositions. His scenes in the career of Luther are marked by singular power, as well as other paintings of his we might name. Rudolph Seitz, known chiefly in frescoes and decorative work, has a remarkable perception of the beauty of physical forms.

When we come to Gabriel Max we find a genius to the analysis of whose masterly conceptions we should much prefer devoting an article instead of a few meagre paragraphs. In respect of mental grasp and imagination, combined with admirable technical ability, we should give the first place in the contemporary Munich school to Max and Böcklin. Artists and public are alike agreed upon the surpassing character of Max's works, although, of course, some prefer one painting to another, while the rather morbid tendency of his subjects makes these paintings better suited, perhaps, to exhibition in a public gallery than in a private drawing-room. In disposition he is retiring, and difficult of access to all but a few

select friends, and rarely can any one be admitted to his studio; but at the same time he is of a genial nature and of a social turn

FRANZ LENBACH.

when in company with his chosen friends. We can notice but two of his works, adding, however, that these do not wholly convey an idea of the variety of subjects which he has treated. The first, it is said, allegorically represents an incident from his own life. In the semi-twilight of an autumn evening we see a company assembled under a wood, dancers and others, in the picturesque costume of mediæval times. Lanterns light up the scene in the distance. In the foreground, alone amidst the gay dancers circling around him, is a young man leaning pensively against a tree. This is supposed to represent the artist himself. To him, on his right, advances a beautiful maiden leaning on the arm of another youth. Her face is one of entrancing loveliness: she is his betrothed. But in her hand she holds out to him a wild crocus—a flower whose meaning, when given by a lady to her lover, is that he can never more hope for her love. In the mean time, on this side of the tree, unseen by him, a lady approaches, with a veil over her head, but her features visible in profile. She is older than the other lady, but in her mien is dignity combined with grace and beauty. She is the lady who is destined eventually to become his wife. This painting, while admirable in the rendering of each individual character, is also of pre-eminent artistic worth for the regard paid to the values, the quality of the texture and color, and its unity and harmony as a composition.

The other painting is taken from "Faust," and is entitled "Gretchen." It represents Margaret on the mountain-side on Walpurgis-night. Nothing can be simpler as a composition, but it is difficult to see how the artist could have better succeeded in giving us on one canvas a more complete epitome of the tragic life of the pure, greatly injured, and afflicted child of destiny whom Goethe has chosen to symbolize such a vast multitude whose pathetic and mysterious fate can not be explained by any human logic. A solitary figure she appears, robed in white, and still so represented as to suggest a certain ghostly impalpableness. She stands on the grass, scarcely pressed by her pale feet. Behind her, faintly discernible in the gloom, are the rocks, and nearer, ravens pecking at a diamond ring. A white band around her neck conceals the mode of her bloody execution, but it is suggested with awful vividness by a faint crimson circle saturating the linen.

GABRIEL MAX.

An empty locket hangs on her breast. A sober supernatural light shines on the upper part of this silent form, gradually fading into gray shadow. But the face it is which, after one has gazed long at the painting, continues to rivet the eye, and haunts one forever. In the eyes, which seem not of earth, there is an expression of silent horror and agony beyond language, and mingled with it a reproachful, pleading expostulation that out of the innocence and happiness of maidenhood she

should have been torn to meet such a fate, and spend eternity far from the abodes of the blessed, while on the closed ashen lips is depicted the resignation of despair. The exquisite color of this masterly conception is so in harmony with the design that no engraving or photograph can do it justice. It is said to be a favorite work with Max, and we know of no other living artist besides Gebhardt, of Berlin, who could approach it. There is none who so well rep-

"THE LION'S BRIDE."—[G. MAX.]

resents the hues and aspects of the dead. The painting of which an engraving is given here, "The Lion's Bride," is from one of Uhland's poems. It is perhaps open to criticism for its color in one or two parts, but is a very powerful composition, and well exhibits the great skill Max also possesses in the drawing and painting of animals. An engraving of this scene perhaps gives a better idea of his varied powers than of most of his other paintings. Many will doubtless remember the exquisitely touching composition which has recently become known in America through a photograph taken from it. A young girl, a Christian martyr, has just been left to the tigers in the arena of the Coliseum. The wild beasts are fawning about her before tearing her to pieces, while a tiger rushes forth with open jaws from the den. At this awful moment some pitying soul amidst the throng above drops a flower furtively at her feet, as a sign that one, at least, is there to offer up a prayer and drop a tear for her as she meets her doom. She, in her helplessness, leans against the wall, and looks up to see who it is, wondering that there is any one left in a cruel world to pity the lonely victim. This painting is by Gabriel Max, one of the greatest poets of the age, for his paintings are tragic poems dealing with human destiny.

We pass, by a natural transition, to the *genre* painters of the Munich school, and here we find a large number of very excellent artists. Defregger has justly earned a foremost position in compositions taken from peasant life. Truth to nature, admirable color, texture, and character, all seem to be his in equal proportions. After him may be mentioned Gysis, a Greek, whose art life has been entirely in Munich. His color seems scarcely inferior to Decamp's in the rendering of Oriental scenes, while his native familiarity with them has given him remarkable skill in catching the traits of Eastern character. Albert Keller and Alois Galb are also young men of decided promise in this branch. Dietz, in the rendering of *genre* with horses and landscape, holds a position entirely alone, having a style crisp and full of freshness and originality, and resembling that of no other artist. He is very difficult to please, sometimes entirely painting out a finished work. As an illustrator he ranks with Menzel, of Berlin, and has produced thousands of drawings. This has probably quickened a memory and observation naturally strong, and thus, like Turner and several other artists similarly constituted, he does not depend wholly on color studies for his compositions, and yet few excel him in giving a feeling of nature. His horses could only be drawn by a man of genius. Brandt is another of these masters who overwhelm us with the wealth of

the artistic work now turned out in Munich. He is a Pole by birth, a German in art education. His subjects are always chosen from the steppes of the Ukraine or the Crimea, wild, desolate, picturesquely suggestive. The Cossacks of the Don, the gaunt, nervous, wiry, many-colored steeds they spur to rapine and war—these are what he gives us, either in groups of three or four, or whole squadrons marching across the russet ocean-like wastes overarched by leaden skies. No artist of the age is his superior in the technical requirements of his art, while the spirit, individuality, character, and tone with

FRANZ DEFREGGER.

which each horse and each rider is given lead one to feel that Meissonier and Detaille still have something to learn.

Of animal painters there are, besides Dietz and Brandt, a number worth extended notice; we can allude to but one or two. Wagner is well known in America by photographs of his "Roman Chariot Race." He has done nothing since to equal that. Braith is unequal, but sometimes draws and paints cattle with great force and truth to nature. Zügel is still a young man, like many of those already mentioned, and will give the world yet better things than he has already done; he is not yet the equal of Jacques, the Frenchman; but in a just rendering of the values, with a true feeling for nature, he holds an excellent rank. Bodenmüller is a rising artist who is strong in painting battle scenes, especially of the late war. But Franz Adam is undoubtedly the ablest battle painter of the present German school.

In landscape there are fewer good artists

in Munich in proportion to the number in other departments, but some of them are men of genius. Lier and Mezgoly are deserving of far more than a passing allusion. Thoma also shows eccentric ability, but has evidently been largely influenced by Böcklin, who might also be nearly as well

the artists considered him a dreamer, and his works absurd. Now he ranks with the first three or four living painters of Germany. The fact is that to a wonderful eye for form and color he adds an imagination of extraordinary creative power, and the sympathy with the hidden suggestions of

“THE COSSACKS GREETING THE STEPPES.”—[BRANDT.]

classed with some of those previously noticed, such is his versatility and the nearly equal excellence he achieves in almost every subject he undertakes. He has been painting for many years, but for long was neither understood nor appreciated. He was, as it were, born before his time. Even

nature of a Wordsworth or a Bryant, blended with the wild weirdness of Poe and the startling mysteriousness of Coleridge or La Motte-Fouqué. Now he shall paint you an imaginary Roman villa on a rocky ledge by the sea, which in long, gray, moaning surges beats against the cliff, and sweeps for ever-

more into the hollow caves. Above, against a sad evening sky, stands the lonely palace, surrounded by foliage, amidst which are seen marble statues, and on the extreme edge of the low cliff a solemn row of dark, Druid-like cypresses sway in the gale. The only sign of human life is a tall, slender

pietied an idyllic episode from Theocritus—a young shepherd, the size of life, playing on his syrinx, and a wood-nymph concealed in the shrubbery behind listening to his love song. The next scene he will give you will be, portrayed with immense strength, an anchorite on a narrow ledge half-way

"CALVES RETURNING HOME."—[BRAITH.]

young girl draped in black standing on the beach, leaning against the cliff, with arms crossed on her breast, seemingly gazing forlorn on the sea, and musing on the transitoriness of human affairs, and the desolation which has left her there the last of her line. Then you turn from this canvas and see de-

down the side of a tremendous precipice, scantily clad in a goat-skin, kneeling before a rude cross made of two boughs bound together by a vine, and scourging his bare back with knotted cords. Another scene may be a young shepherdess lying the livelong day amidst Italian poppies and daisies,

while her flock are quietly nibbling the herbage at her side. Then you turn once more to gaze amazed on a mermaid and a merman reposing on the oozy rocks of a reef, their limbs covered with trailing seaweed. She, leaning over the ledge, toyingly grasps the neck of a sea-serpent mag-

d'esprit, a sea-serpent copied from the one above was presented to Böcklin. Then you shall have a windy autumn evening, the setting sun striking a golden path across the centre of the scene, a farm-house beyond, a startled horse in the foreground endeavoring to throw his rider, and, above,

"PEASANTS' BALL."—[DEFREGGER.]

nificently painted; he is looking seaward and blowing on a conch shell. Beyond, the surges of the raging, storm-beaten sea roll in from the far off eternity of ocean with a stern, savage power and a truth to nature such as I have never seen surpassed. At an artistic *soirée* in Munich, among other *jeux*

the trees swaying with the surging blast of an October storm. Or it is Pan piping to himself among the reeds on a river's bank that we see before us, in the golden age of which the poets sing.

Böcklin has also painted with success in distemper, and rivals the Rossetti school in

their peculiar field of archaic, fantastic, realistic unrealism. But fortunately he does not waste his talents on much of that sort of work, in which his success serves rather to display the more forcibly the extraordinary and versatile character of his genius. He painted a portrait of himself with a skeleton standing behind him and directing his hand. At the same time, although at last well known in Germany, and acknowledged to be entitled to a very high position, Böcklin can probably never be, in the ordinary sense of the term, a popular artist, for it requires a certain degree of art culture and a mind that revels in the contemplation of the ideal, to fully perceive his merits. He is like certain poets whose works, although celebrated far and wide, are caviare to the mass of readers—Robert Browning, for example. But his influence on German art is perceptible in various quarters.

Eduard Grützner is another of the very clever artists of the *genre* school of Munich. Like Chevilliard, of Paris, he makes a specialty of hitting off the human nature which churchmen retain even after they have donned the cowl and cassock and forsworn the lusts of the flesh. He is very acute in seizing certain expressions of the countenance, and his satire is not too severe to impair the exquisite sense of humor conveyed in his graphic compositions. But he is stronger in drawing than in color.

We might go on to speak at length of Sindig, a coast painter, who makes one actually hear the roar of the breakers as they chase each other in tumultuous masses, and lash the rocks with a power that may be felt as one gazes on the canvas; or of the numerous and sometimes excellent painters of interiors, with still-life, like Hepler, Meyer von Gratz, and Friederich Keller; or of Hennings, a brilliant and dashing colorist, who gives us rococo subjects, ladies and gentlemen of the Louis Quatorze days. But the reader must go to Munich and see these things for himself. Before leaving it for Vienna, it should be observed that the kindred arts of sculpture and architecture show us little of note doing there at present. Max Windmann, professor of the art, is doubtless the best sculptor now there, and some of his

HANS MAKART.

works are deservedly praised for their spirit and grace. The architecture of Munich seems passing from the severe Italian introduced by King Ludwig to the ornate style of Vienna. In wood-engraving a decided improvement is noticeable, not only in Munich, but in other German art centres. The hard, cold, repelling style so long characteristic of German wood-engraving is becoming more free, flowing, and suggestive of color, allowing the engraver better to express his own feeling in

the work. Hecht and Waller are two of the best engravers now in Munich.

When we come to a consideration of the other schools of contemporary German art, it should be noted that most of them are offshoots of the Munich schools, especially in the present phase of this work. At Vienna we reach a social atmosphere resembling that of Paris, and consequently, according to the inevitable laws which regulate art development, there is a certain resemblance in the subjects chosen to those which distinguish contemporary French art. The leading men there were called by the emperor from Munich, and, doubtless without any deliberate intention on his part, they are just the artists in Munich who remind us most of the French school. There is a Royal Academy in Vienna, with a regular corps of instructors, and much good art will in time be the result. Feuerbach and Makart, both Munich men by education, and still comparatively young, are among the prominent instructors. Feuerbach reminds one somewhat of Cabanel in his style. His color is cool and quiet, but exquisitely modulated, although sometimes he does himself injustice in this respect, and there is the same admirable modeling and delicate yet effective touch of the French artist. Their choice of subjects is also somewhat similar, although the former occasionally launches out on immense canvases with a multitude of nude figures, as in his "Battle of the Amazons," which does not, however, show him at his best. His "Iphigenia at Aulis" is a superior composition, simple, low in tone, harmonious in color, and with genuine pathos in the attitude of the unfortunate heroine of poesy, who, meditating on her approaching doom, gazes off on the blue Aegean, which looks

too beautiful ever to be the scene of such a tragic drama. Makart, a young man with coal-black eyes and beard, and an Oriental cast of features, reminds us in some of his subjects and treatment of Henri Regnault. The "gorgeous East" has furnished him many

although sometimes defective, the magnificent dash of his brush, the Veronese-like splendor of his coloring, entitle him to a position among the first artists of the age. But while granting him possession of the rare quality called genius, we as yet see no

"FELLAH WOMEN AT THE FOUNTAIN."—[MAKART.]

subjects. He is undoubtedly a man of very great technical ability. There is a breadth of handling, a boldness, a self-reliant power in his paintings which command attention and respect at once. One feels at a glance that he is in the presence of a master. The massiveness of his drawing and composition,

trace in his works of any thing that appeals to man's deeper nature, and even while enthusiastic in his praise, feel an important element lacking in his paintings, that would not be missed in productions making less demands on our admiration.

Canon is a portrait painter who merits a

much more extended notice; and the same may be said of Pettenkofer, one of the oldest and best known of the Vienna artists, who excels in *genre*, while Brunner holds a good position in landscape.

Probably the first place in Germany must be given to Vienna in architecture and the industrial arts. It can not be said that a new order of architecture has been invented there. In the present style of building we

recently made for the table service of the Emperor Francis Joseph ranks in glass-ware with the best china-ware of Sevres or the Minton's. We have seen nothing in the contemporary ceramic art of Germany to equal that of either England or France; but the terra cotta works of Anton Grassl at Munich are deserving of considerable praise, and the same may be said of the majolica-ware of Fleischman at Nuremberg. We may

"IN A THOUSAND ANXIETIES."—[L. KNAUS.]

see rather an adaptation of old styles, chiefly Renaissance, displaying luxurious richness and an employment of the caryatid which is beautiful, but may be carried to excess, especially when the constructive principles of true architectural decoration are disregarded. Sempfer, the leading architect of Vienna, ranks with Viollet-le-Duc, of Paris, and Spiers and Street, of London. Exquisite as is much of the household art of Vienna, it rarely impresses one like the vigorous carvings of which so many wonderful specimens have come down to our day from Flanders or Nuremberg or France, even far back to the oaken stalls and canopies of the choirs and tombs of the Middle Ages. What living artist of this description is there who can be mentioned by the side of Peter Vischer, whose shrine over the tomb of St. Sebald eclipses all modern work of the kind? But in glass-ware the Viennese artists can justly claim to have equaled and perhaps surpassed the rest of the world both in design and execution. Lobmeyer and Co. employ artists of remarkable skill in design. A set

add that the royal institution for making stained glass in Munich has been closed. Both in methods and results it was found to compare unfavorably with the stained glass of the Middle Ages.

The school at Düsseldorf is probably better known in America than any other in Germany. Twenty-five years ago it was already in its prime, and a number of its artists—men of ability they were, too—had settled in the United States, and painted some of our historic scenes. Its celebrated gallery of paintings has always given it importance, and such men as Achenbach have given it dignity to this day. But it has been with regret that art lovers have perceived that conventionalism was stealing into that art hold, and impairing the value of the work even of some of its best artists to that degree that it has become at last a by-word to say of an artist that he painted in the Düsseldorf style. A method which may have real merit while fresh and original becomes conventional when scores and hundreds of artists gradually settle down to

copying that style, thus showing that they look at nature through the eyes of others, instead of realizing in their practice that there are innumerable truths in nature, and that each artist should interpret those truths in his own handwriting. - But the influence of Paris on the one hand, and of Munich on the other, has at last become perceptible there. Men of perhaps no greater powers than those they supersede are, however, working in a truer manner, and the results are sometimes admirable. Andreas Achenbach, great alike in landscape and coast scenes, is now growing old, and at the same time is so well known at home that we do not need more than to allude to him. Schönbauer, who paints the picturesque groups, fishing boats, and sea-ports of the North Sea, is a rising artist well meriting great praise in his department. He also etches his works in a superior manner. Normann, a Norwegian, gives us the magnificent coast scenery of his native land with much vigor and freshness; while Dücker, who is also a painter of coast and landscape, is an artist whose tone and touch and resemblance to nature in his canvases place him among the foremost painters of the age in that line. Wilroider and Fahrbach are also strong in landscape; and Mundt, in the delineation of quiet, russet autumn and winter landscapes, with leafless trees and admirable groups of cattle, rightly holds a very high position. In *genre*,

LUDWIG KNAUS.

among many, we can only allude to Vautier as an artist well known in Germany for his genius; and we might also speak of Knaus, but he has just been called to the Royal Academy at Berlin, which is some indication of the estimate placed on his powers by his countrymen. Oswald Achenbach also shows strength in *genre* with landscape.

In Carlsruhe is a Royal Academy, presided over by such men as Ferdinand Keller, a *genre* painter, and Gude, who excels in vigorous representations of coast and sea. At Stuttgart is also an Academy under government patronage. In that city there is also an art society, established for the purpose of encouraging historical painting in Germany. It is open to all subscribers, and the sovereigns of the different states of the empire are among the number. Circulars are sent annually to the artists inviting them to enter works for competition. Those intending to contribute send a color sketch to the superintending committee. If it is approved, the larger painting follows, and is submitted to examination. Once a year an exhibition is held, and certain paintings are purchased from the general fund, and then disposed of by lottery to the subscribers.

At Berlin we find the most interesting art school in Germany, after that of Munich—valuable not only for what its artists are now doing, but for the rich promise it holds forth. Without in the least derogating from the just claims and merits of the Munich Academy, it appears to us, from the nature of the case, that the Berlin school must ere long equal it in the average quality of its art, and surpass it as a representative national school. For at Munich, through a gradual process, they seem to have reached full fruition according to the general laws which govern human affairs; the next change there must be toward a new order of things. At Berlin, on the other hand, that art process is now going on toward its legitimate results, while the growing importance of Berlin, tending to make it the centre of Germanic influences, will also as surely attract the artists thither more and more until it becomes in turn the art capital of Germany, and, for a time at least, of the continent. Every attention is also bestowed there to encourage art progress, and artists hold a social position there hardly yet granted to them in England, notwithstanding the traditional strictness with which rank distinctions are preserved in Germany. This may be partly owing to the circumstance that several members of the royal family are practical artists, and that the Crown Princess herself condescends to exhibit works from her own hand in the art expositions. The Royal Academy has also been recently entirely reorganized, and furnished with an able corps of professors, including also a chair of *belles-lettres*, and a system of biennial exhibitions has been established that will be of great value as a stimulus to German art. The second one was opened 1876. These exhibitions are opened in August, and continue until November, and gold medals are awarded to the most meritorious works offered in all the departments of art.

Some artists of very great power are also now giving dignity to the Berlin school, and the number is continually increasing. While rather than with the more subtle and perhaps intellectual harmonies of quiet grays; each style has its merits, and to decry one

"REVERIE."—[GUSTAV RICHTER.]

there is every where a distinct individuality preserved among them in style and subject, they are generally distinguished for a good perception of color, careful drawing, a study of nature, and an earnestness in a consideration of the true relations of art to society and the problems of human existence which, on the one hand, enables them to threaten French art with a powerful rivalry in its strongest point, technical art, and, on the other hand, places them above the French school, and quite on a level with the best English art.

Richter and Becker are both professors and fellows of the Royal Academy of Berlin, and are probably among the German artists best known in America, the former by chromos of his paintings, the latter by numerous works in private galleries. They are both men of very decided ability, similar in artistic traits, although generally handling different subjects. They deal chiefly with the dashing and more obvious effects of brilliant combinations of color,

because it is not the other, is about as sensible as to rail at Italian music because it is not German. It does not aim at the same effect; it appeals, perhaps, to a different audience, certainly to a different set of emotions; but it has its merits for all that. There is, however, sometimes perceptible what is termed a certain "sweetness" in the *technique* of both of these artists which is not quite so pleasing to the artistic eye of some as more vigorous treatment, and one soon cloy with their pictures because of a certain sensuousness apparent in most of them. Of the two, Richter seems to us the abler artist; some of his portraits and studies of Oriental character are very rich, and of a nature to be more popular than are the works of some much greater painters.

Gussow, also a professor in the Academy, ranks high in portraiture, combined sometimes with *genre*. His treatment and rendering of character are sometimes just, and in some respects admirable. But in almost all his faces there is a certain spot, a gloss,

where the light strikes on the countenance, which he evidently considers a great beauty, for he contrives to bring it into every painting of his we have seen. It is certainly peculiar to his works, and may perhaps be sometimes a beauty in nature; but as he represents it with a dab of crude white, it enables the observer to realize as never before the questionable advantages of the pearl-powder so universally found on the toilet table of the ladies of the nineteenth century.

Knaus, called from Düsseldorf to assume a chair in the Academy at Berlin, is naturally one of the ablest artists in Germany. In methods perhaps slightly behind some of the younger men of the German school, he is, notwithstanding, an artist of a very high order in *genre*. Older than Defregger, of Munich, it can not be said that the younger painter has surpassed the former in masterly representations of human character. The humorous and the pathetic are alike treated by him. Take, for example, the every-day domestic scene, of which a cut is given on page 17, "In a Thousand Anxieties," as one phase of his genius; another phase is well indicated by his wonderfully touching and poetic scene entitled, "A Country Funeral." But while Knaus may be said to have made a specialty of scenes taken from peasant life, he is also successful in other directions. His "Holy Family" may be instanced as a very beautiful production.

Menzel is another of

the very able men who lend importance to the Berlin school. In black and white, aquarelle and oil-colors, he seems equally strong. His fancy and imagination are very vivid, and his facility in grouping masses of figures and seizing character is quite original and wonderful. He is also well known as an illustrator. Passini is widely and justly celebrated as a consummate artist in water-color representations of Italian life. Camphausen, A. von Werner, and Bleibtren are all artists of ability in *genre* and figure painting. The latter, a professor in the Academy, has executed a very striking representation of the meeting of Generals Von Moltke and Whimpfen discussing the terms of the surrender at Sedan. Spangenberg, also a professor in the Academy, is a man of serious aspirations, whose imagi-

nation deals with the burden of life which oppresses so many, thoroughly Germanic in his mental characteristics, and also an admirable painter. His scene entitled "Death's Train" is a work of singular originality and power. On a desolate moor, overhung by a gray sky, the procession is seen. In the foreground is the grim skeleton Death in a monk's sombre garb. By his side walk children of various ages, pathetic beauty in their infantile faces. Behind follow the bride in her bridal veil, Kaiser and peasant, maiden and matron. all classes and conditions, mys-

STATUE OF FREDERICK WILLIAM III.—[WOLFF.]

tically robed in the costume of the Middle Ages, until the long train gradually fades in the dim distance. Death rings a bell for the next one to fall into the ranks, and a handsome youth in the foreground of the scene, hearing the inexorable summons, tears

man art to maintain for long the position it is gaining in contemporary European art. We do not remember a representation of the "Last Supper" which shows a more powerful realization of the vast and conflicting emotions which shook the souls of those who

"THE LAST SUPPER."—[E. VON GEBHARDT.]

himself away from his weeping bride; while on the other side of Death an aged woman, bereft of all that made earth dear, vainly stretches out her withered arms, beseeching that she might be summoned instead. Von Gebhardt is another young painter of Berlin who has won extraordinary success in a similar direction, and if he continues as he has begun, will do much to enable Ger-

met together in that memorable hour in the history of the human race.

In the sculpture department of the Berlin Academy there is noticeable a number of artists of ability, and in this direction Berlin seems at present to lead the other German schools. We can only allude to Begas, professor in the Academy, Brunow, Hartzler, Moser, Rensch, Simmering, and Wolff. The

latter, also a professor in the Academy, designed the magnificent bronze equestrian monument to Frederick William III., which has just been opened to public inspection. Architecture in Berlin offers nothing very striking; but the new Gymnasium, chiefly in red brick, indicates a step in the right direction. If not after a new order, it is a very happy adaptation of old styles to modern uses.

It must be evident from this rapid survey of contemporary German art that it is entitled to very careful and respectful consideration, both on the part of artists and amateurs. And in taking a retrospect of the whole question of contemporary art in Europe, we are inclined to think that the French government, instead of offering a prize of five thousand francs for the best essay to show the causes which render contemporary French art pre-eminent beyond other schools of the day, might better have offered a prize to explain the causes which enable the art of Germany, five hundred years after she first produced an art school, to equal French art in *technique*, and to surpass it in the field of imagination and moral grandeur.

A DREAM-LAND CITY.

SOMETIMES the guarded gates
Of the Unseen on outward hinges roll,
And in deep dreams of night the troubled soul,
In bright, brief vision, sees the glory of its goal.

Some angel, watchful, kind,
Stoops for the moment from his kindred band,
Reaches, through veil of sleep, a pitying hand,
And leads the Dreamer forth into a fairer land.

Such boon to me was given.
Thus to my sorrow came a sweet release;
Sleep's magic touches gave to pain surcease;
And forth my spirit passed into transcendent peace.

A city beautiful
Shone on my vision. Palaces of white
And gleaming marble, in a noonday light,
Glittered along wide streets with pearly pavements bright.

Amaranth and asphodel
Above each pillared door their blossoms hung;
From every mansion mystic music rung,
For Poesie was here the only voice and tongue.

High in the city's midst
Arose a Temple, as the sunset bright;

Of flame-like splendor, dazzling to the sight—
Arch, column, altar, glowed with an interior light.

"This is the shrine of Song,"
A voice beside me uttered. "This her home,
Her chosen dwelling. Hither none may come
But her beloved, her own. Fame's worshipers
are dumb.

"Forth from her temple flows
Perpetual inspiration. Glorious themes
Break on the vision in ecstatic gleams.
Embodied here the bard beholds his rarest
dreams.

"Hither the minstrels throng—
The masters wearing laurels centuries old,
Bards who the harp-strings smote with fingers
bold,
And they whose softer lays with faltering lips
were told.

"Nor they alone whose brows
On earth the victor's sparkling wreath have
worn;
These, too, whom Fate of every bliss hath
shorn,
Save of the matchless boon—that they were
singers born."

Even as he spoke there rolled
From out that inner shrine a tide of song.
Each outer voice the anthem bore along:
The angel at my side responded full and strong.

"This is indeed my home!"
I cried. "Here every grief I may forget;
Here even for me are peace and rapture met."
My guide, in tender voice, replied, "Not yet!"

The dream was at an end;
Yet in its light I walked through many days,
Seeing no darkness in them, for my gaze,
Illumined once, still burned with the celestial
rays.

Now, singing as I go,
Little I heed, although the path is long.
Light from above hath made my spirit strong.
It is enough to be the humblest child of
Song.

And I will be content
To love her for herself; with homage sweet
To sing unheard, unanswered, at her feet,
Till in some other life I make my song complete.

FIRST GLIMPSE OF THE OQUOSSOC, KIMBALLS.

THE ANDROSCOGGIN LAKES.

WE call Maine the "Pine-tree State." "Lake State" would be an equally appropriate and distinctive appellation. Her forests are gradually falling before the advancing stroke of the lumberman, but her lakes can never be lost out of her mountain-guarded territory, nor can their charms ever be lessened by the touch of settlement and civilization. There are more than fifteen hundred of them laid down upon the better maps in use; hundreds more are too small to be enumerated in a general survey; while many others lie hidden in regions that have not yet been explored. The author of *Water-Power of Maine* says, in that work: "There are but three or four districts on the globe, not more extensive than Maine, and equally habitable in other respects, upon which an equal number of receptacles for impounding rain-fall, of not inferior capacity and surface, is to be found.....The Kennebec River has more lakes connected with it than the gigantic Orinoco, and the Penobscot than the Oregon, or than all the rivers in Africa, so far as is known."

But the Kennebec and the Penobscot are only two of half a dozen important rivers in Maine, each of which is connected with an extensive lake system of its own. These two rivers drain the central portions of the State, the Kennebec being the outlet of the great Moosehead Lake, whose varied attractions have already received due notice in the pages of this Magazine. Far to the eastward, on the confines of New Brunswick, the St. Croix River and the Schoodic Lakes; to the north of these, the St. John and the Eagle Lakes; to the west again, following along the Canada border, the Alleguash and the lakes of upper Piscat-

SOURCE OF THE ANDROSCOGGIN RIVER.

aquis County ; and finally, well around on the New Hampshire line, the Androscoggin and its lakes. These are only six out of some fifteen systems which are recognized by the geographers. To the last named of the series the attention of the reader is specially invited in this article.

The Androscoggin Lakes, as commonly reckoned, are six in number, though the character of the connecting waters is such in two instances that the number is sometimes reduced to four. Thus Cupsuptic and Mooselucmaguntic are joined by so broad a strait as really to form one body of water, though the configuration of the shores justifies the division which has been adopted in the nomenclature. The same is true of Mollychunkemunk and Welokennebacook, which are sometimes spoken of together as the Richardson Lake, or Lakes. Rangeley Lake, at the upper (northeast) extremity of the chain, and Umbagog, at the lower (southwest) extremity, have each a more distinct individuality, being separated from the others by very palpable streams. All, however, constitute one series, and the waters of the Androscoggin River, as they leave Umbagog by its western shore, gather part of their volume from a small pond which lies away to the east of Rangeley. A dozen or more such smaller ponds are buried in the forests and among the mountains that surround these lakes, and contribute their quotas to the mighty current poured therefrom through the Androscoggin Valley to the ocean. The six lakes have an aggregate surface of seventy-seven square miles. They drain a

tributary area of nine hundred square miles. By aid of dams erected at connecting points, their storage is increased to very nearly 24,000,000,000 cubic feet, and their outflow is but from thirty-six to forty-eight hours in reaching the city of Lewiston, to whose many manufac-

RANGELEY TROPHIES.

tories they furnish an ample and exhaustless power. This function, taken in connection with the extended timber lands which envelop them on every side, gives the chain great importance in a commercial point of view, and the busy lumbering

life of which in winter they form the centre might very properly engross our attention to the exclusion of other aspects. But it is with these lakes as a resort of the sportsman and the tourist that we are now chiefly concerned. As such, they are coming into wide and deserved notice. This northwestern corner of Maine is a lesser Adirondacks. "No part of the world," says the Second Annual Report upon the Natural History and Geology of the State, "affords finer trout-fishing, or a greater variety of trouts, than Maine." And no part of Maine is richer in this particular endowment than this upper half of Franklin and Oxford counties. The wilderness is practically limitless and unbroken. The scenery is always picturesque, and often grand. The fisherman and the hunter may find constant exercise in season for rod and gun. Lovers of nature in her wilder moods are already beginning to make their way into the region in considerable numbers. And nothing is needed but time and a measurable degree of enterprise on the part of those who have the handling of this vast estate to effect its development into one of the most delightful summer resorts which the country contains.

As one notable feature of this lake region, among many that commend it to seekers of health and pleasure, let me mention its altitude, compared with other localities that are better known. Thus the romantic Lake Winnipiseogee, in New Hampshire, is but 501 feet above the level of the sea, and the waters of Lake Superior itself are only 630. But the figures of the Androscoggin Lakes are as follows:

may very properly begin our survey with it, and float down stream. The wish may well be cherished that the ancient Indian name had been retained for this beautiful sheet of water. This was "Oquossoc," or *Arg-was-suc*, as by tradition an old Indian named Matalluck, who once had his haunts upon its shores, gave the pronunciation. Rangeley perpetuates the name of an eccentric but thrifty English squire who penetrated the wilderness thus far many years ago, and laid the foundations of the prosperous plantation which is his monument to-day. His story is a romantic and interesting one.

Mr. Rangeley, for a time after coming to this country, was a merchant in Philadelphia, and later a land speculator in Virginia, with all parts of which State he was very familiar. He is described as having the substantial build and florid countenance of the traditional English squire, with a corresponding hearty manner, but an exceptional degree of politeness and polish for a man of his kind; he also dressed well, and was given to hospitality.

To his early life he seldom referred, and what led him to this remote corner of the wilderness of Maine can only be conjectured. Perhaps it was the scent of mineral values, for he was known to claim the existence of gold ore upon his township; and he was a man who knew what iron pyrites were. The township as he owned it comprised somewhere from 65,000 to 70,000 acres, and he had large plans for its development. The present extensive and growing system of navigation and lumber portage seems to have been a dream of his own, for he fully fore-

SANDY RIVER FALLS, NEAR
MADRID.

built various mills, some of which remain to this day. These were superintended by his sons, who had the look of huntsmen; and he lived with his wife and two daughters in what was then the only good house of the region. This house is believed to be still in existence, but in a decayed and squalid condition.

Mr. Rangeley and his wife were reputed to possess between them a considerable fortune, but his plans were on so great a scale, and his ability to deal with the rude and the shrewd so limited, that he worked at no small disadvantage, at heavy cost, and finally with serious loss. This led him to sell his plantation for \$50,000; but financial disturbances so crippled the purchaser, who had made but part payment, that the property fell back into Mr. Rangeley's hands. Subsequently, with the return of better times, he succeeded, however, in disposing of it, and removed to Portland. He was there established as early as 1842, and there he died not later than 1862. Members of his family are said to be still living in Virginia.

Mr. Rangeley had been followed into his

saw the resources and capabilities of his domain. He

forest paradise by a score or two of families, one after the other, and for their accommodation he built a small church or chapel, which, distinguished by its simple coat of red paint, has probably been preached in by some of the "ruling elders" of the present time. It is in the record that the worthy English squire did not himself attend the services in this secluded house of prayer, but caused worship therein to be held after the manner of the Episcopal Church, for the sake of his wife, who is spoken of as a most kindly and benevolent person.

Mr. Rangeley's greatest public work was a road constructed through "a grand and savage pass" of the Saddle-back range. Its cost was set down at \$30,000, but the road itself is now wholly obliterated. The new road is spoken of as "wholly uninteresting" in comparison. The present writer can say nothing as to the location of this ancient highway, but repeats the tradition respecting it as received from a gentleman of Boston who personally knew Mr. Rangeley, and who visited him in his retreat several times prior to 1840—who is, indeed, the authority for all these interesting particulars concerning this really notable and agreeable character.

But we have yet to reach Rangeley. Farmington is the point from which to do it. This pleasant village of two or three thousand inhabitants lies at the terminus of the Androscoggin branch of the Maine Central Railroad, a day's ride from Boston—half a day's from Portland. There is little to interest the traveller on his way thither, after he leaves the latter city, the route lying through a region that is uninviting, with scarcely an exception. But when he fairly strikes the Sandy River Valley, and crosses it by the curious curved trestle which brings him to the end of his railway ride, he finds himself introduced to views which, for their kind, are nowhere surpassed, not even along the far-famed Conway Meadows. Farmington is the shire town of Franklin County,

SADDLEBACK MOUNTAIN, LOOKING EAST.

and a brisk and energetic place. There is much in and about it which might detain the excursionist to his enjoyment before pushing on up the valley to the lakes and the mountains. The mountains are in full sight before him, and we can not wonder that, yielding to their allurements, he turns his back upon the pleasant walks and delightful drives which the village and its environs afford in every direction, and hastens on over the forty miles of staging which yet remain.

The road closely follows the river, a tributary of the Kennebec, for twenty miles, along well-cleared uplands, through fertile intervalles, under the bold sides of Day's

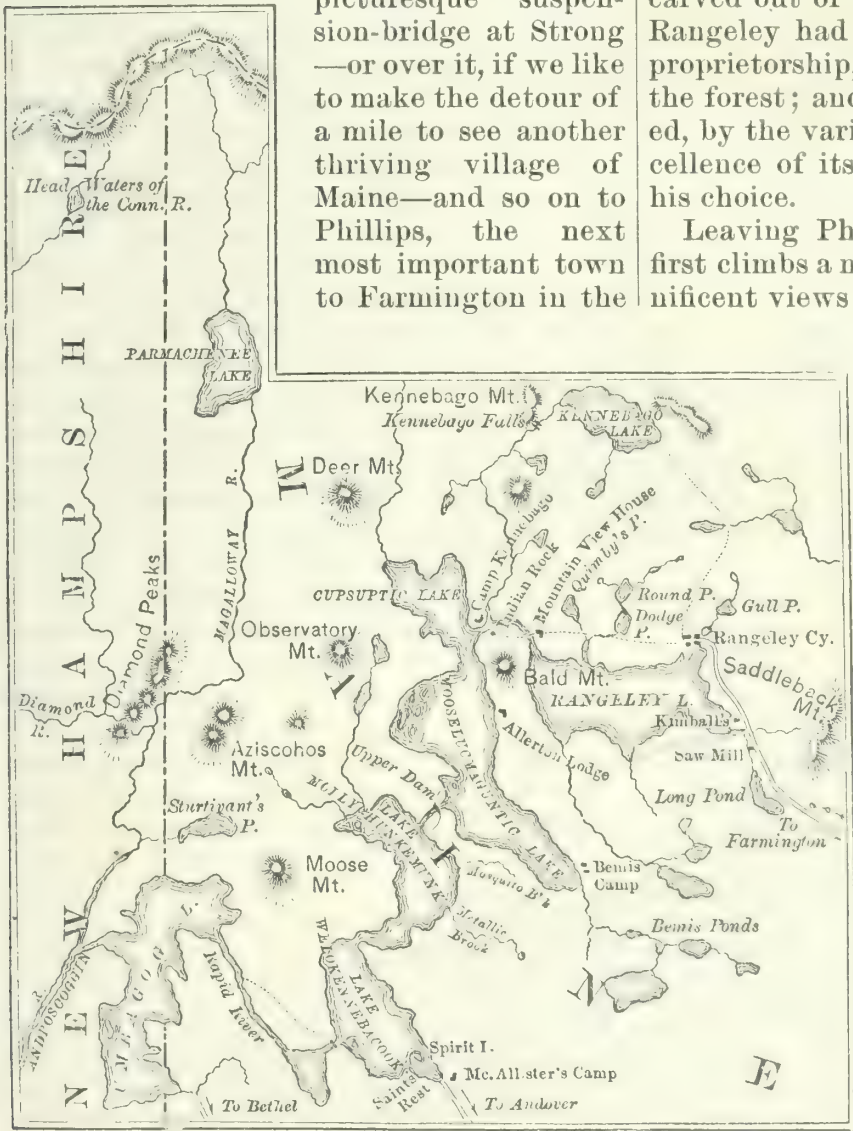

Mountain, past the picturesque suspension-bridge at Strong—or over it, if we like to make the detour of a mile to see another thriving village of Maine—and so on to Phillips, the next most important town to Farmington in the

county, consisting of an upper and lower village, provided with excellent hotels, and supporting a bank and other belongings of an enterprising and prosperous business life. The telegraph wires accompany the traveler as far as here, and here, the stage supplementing the railway, Boston is kept within a day's ride.

The town takes its name from the honorable Phillips family of Massachusetts, by some of whom it was formerly owned and opened for settlement when Maine was only a district of the Old Bay State. The Phillipses and Benjamin Weld, of Boston, were extensive owners of wild lands in this part of Maine, and the towns of Weld, Salem, Avon, Strong, Madrid, and others were all carved out of their broad possessions. Mr. Rangeley had the same ambition of great proprietorship, only he pushed further into the forest; and the domain which he selected, by the variety of its surface and the excellence of its soil, attests the sagacity of his choice.

Leaving Phillips, the road to Rangeley first climbs a massive spur, from which magnificent views are obtained of Mount Blue,

Mount Abraham, and other imposing ranges, and thence descends into the Madrid basin, in traversing which it recovers the Sandy River, from which it had parted at Phillips, to leave it no more until it is lost in its source, the Sandy River Ponds, at the base of Mount Saddleback, just before entering Rangeley. Passing the little village of Madrid, the road presently begins the ascent of Beech Hill, rough barrier to the engaging region that stretches behind it. The tourist now finds himself fairly face to face with the wilderness, though this first taste of it, Beech Hill, is not the most pleasant. He will be a good round hour and a half in reaching its summit; but the tedium of the effort

MAP OF THE ANDROSCOGGIN LAKE REGION.

will have ample compensation if it be his fortune, as it was the writer's in the summer of 1875, to see therefrom a bear in all the liberty of his natural estate. Bruin had come out of the woods into a clearing, across the deep ravine which the road skirts at this point, and was making himself busy with the strawberries which grew plentifully among the stumps and bushes. He rose on his haunches a moment to attend to our excited salutations, and then unconcernedly resumed his berrying. His unconcern was destined not to last, however, for, a day or two later, a hunting party, aroused

by the news, started in search of him, and bore back his skin in triumph. To look at the scraggy sides of Mount Saddleback, as it here looms up before the observer, one would think that bears in plenty might abound thereon, but the actual sight of one is uncommon enough now to be a real sensation even to the natives.

The descent of Beech Hill brings one to the Sandy River Ponds, three or four in number, but insignificant sheets of water, save for the interest which always attaches to a river's source. The locality has this claim upon notice, however, that here the head waters of tributaries of the Kennebec and of the Androscoggin spring side by side. Long Pond, which the road strikes while yet in sight of the first of the Sandy River Ponds, is the first of the Rangeley series, and the "divide" between the two systems scarcely exceeds the measure of a "biscuit toss." At such a point as this the moralist will of course pause to pluck an illustration.

Passing Long Pond, which the intervening woods mostly conceal from view, a delightful ride of a few miles opens the first glimpse of Oquossoc, or Rangeley Lake, as it is now commonly called—at one time, not very long ago, quite pleasantly known as "The Englishman's

Pond." It is a beautiful sheet of water, of irregular shore, its greatest length being about ten miles, and its greatest width some three or four. The head of the lake at the inlet is not visible from the road, but its proximity is marked by "Kimball's," the first "good square" house to be seen since leaving Madrid. The situation of the

house, which is kept for the accommodation of the public, and is the first hotel on entering the lake region from this direction, is low and hemmed in, giving no hint of the fine scenery and varying attractions to which it is the gateway. Greenvale is the termination of the regular stage route, and "Kimball's" is the well-kept house which would be expected under the circumstances. From

KENNEBAGO FALLS.

the stream a few rods below the house the stanch and jaunty little steamer *Mollychunkemunk* makes her daily round trip to the

tinues along the eastern arm of the lake, rising at once to a point on the broad slope which forms the shore sufficiently high to

A SIX-POUNDER.

foot of the lake and back, running in connection with similar boats upon the other lakes of the chain. "Kimball's" thus becomes a proper and convenient place of transit for those who are going "in" or coming "out," as the case may be, and as such it has already achieved a wide and deserved popularity among the hundreds of sportsmen and pleasure-seekers who are frequenting the lakes every season in constantly increasing numbers.

Leaving "Kimball's," the main road con-

give a really magnificent view. You are here fairly within the limits of Rangeley settlement, and the road traverses for three miles a tier of well-cleared and productive farms. Below, to the left, stretches the lake, its surface broken by but one distinguishable island, hemmed in by bold ranges of hills, and flanked at its western extremity by the picturesque Bald Mountain, which there rises abruptly from the water's edge. The settlement is confined almost exclusively to the northern and eastern slopes. The

other shores are for the most part covered with dense forests, the outskirts of the wilderness that reaches away to the boundaries of New Hampshire and Canada. The horizon line in every direction is varied and grand, being made up by distant mountains massed one against another.

Three miles beyond Greenvale, along this road, at the northeast arm of the lake, where the entering stream from the Haley and Gull ponds furnishes a valuable water-power, is "Rangeley City," a small but sturdy little hamlet of a dozen or twenty buildings, the centre of the township's trade. A "right smart place" it is, too, with post-office, public hall, an excellent hotel (Hinkley's "Rangeley House"), two country stores, two saw-mills (one run by water, and the other by steam), a boat-building shop, two blacksmiths' shops, a shoe-maker's, and—will the reader believe it?—a bakery. It is but fair, however, to explain that this backwoods bakery is the ingenious and accommodating device of Mr. Tibbetts, the boat-builder, who, of a Saturday night, cleans out the furnace of his steam-engine, and bids his neighbors bring thither their pots of brown-bread and beans for a night of it. Great was our astonishment, on sitting down to the traditional Sunday morning breakfast at "Hinkley's" on the occasion of our last visit, to be told by our host that our brown-bread "was baked in the bakery."

Mr. Tibbetts's "bakery" is not the only thing to his credit. His boats have carried

portion of the little village of Rangeley, including Tibbetts's bakery, was destroyed by fire in the fall of 1876, but when our artist visited the spot, two weeks afterward, the enterprising citizens had begun to rebuild on a larger scale.

In anticipation of the growth which Rangeley City is destined to enjoy, the squire of the town, Mr. J. A. Burke, is erecting, the present season, a new hotel upon the hill-side. The plans have been drawn by a competent architect, and the house will be one of the largest and best in the State, outside of the cities and large towns. With the little steamer touching daily at the "City," the delightful drives leading from it in various directions, the several fishing localities for which it is the point of easiest departure, and, above all, its entire freedom from the annoyance inflicted by that pest of the woods, the black-fly—with all these things in its favor, it would seem certain that Rangeley City is destined to acquire a position of no small importance in its little world.

Among the short excursions for sport or pleasure, of which Hinkley's, at Rangeley City, is, and Burke's new hotel will be, the best starting-point, are to Quimby's, Dodge, Round, and Perk ponds—small sheets within a few miles' ride, all affording good fishing at proper seasons of the year; to "Boobytown," by the "Boobytown" road—a route bringing the excursionist face to face with some of the grandest views in all the region,

CAMP ON THE KENNEBAGO.

his fame over all the lakes, and his shop is a place which every sportsman in the region makes a point of patronizing. He builds his craft something after the model of a "birch," first framing his streaks on a mould, and then strengthening the shell by a light knee-work within. The boat emerges from his hands at a cost of about fifty dollars, easily carrying six men, and easily to be carried by two or three. They are models of lightness, swiftness, and beauty. A large

and into the neighborhood of a little knot of families whose condition and habits are a study in human nature; to the Dead River Pond and the Redington Stream—a direction alluring to the angler; to the blueberry fields beyond Gull Pond, along the north shore, by a well-kept road of half a dozen miles, which picturesquely climbs the hills, and carries one past some of the best farms in the township; over to the south shore, which a road less travelled follows only

for about three miles, to the "jumping-off place," where the outposts of civilization are lost in the edge of the forest; and, finally, to Kennebago Lake, which lies in the woods directly to the north of Rangeley, distant some eight miles.

Rangeley, the reader can readily picture its character and surroundings.

This whole tract of wilderness, covered with heavy forests, and diversified with mountain, pond, and stream, abounds with scenes of the most romantic beauty. One

MOUNTAIN VIEW HOUSE.

The excursion to Kennebago makes a considerable demand upon him who attempts it, but is not to be overlooked by any who have really a first-class appetite for camp life. The lake is one of the most beautiful of all the feeders of the Rangeley system, walled in by mountains, and entirely cut off from the permanent haunts of men. One or two rough camps furnish the rudest of sleeping accommodations to the visitor, who must, however, take in with him his own stores, and do his own cooking. The road thither from Rangeley is not so very long, but it is circuitous and difficult, and, after the first two or three miles, not easily passable by wagons. Kennebago pilgrims must, therefore, make most of the distance on foot, and carry their rations with them, which, if their stay is to be but a day or two, will not be so formidable a burden as to offset the pleasure of the trip. From four to five hours is needed for it: in one day and out another is a good schedule for those whose time is limited. The attraction at Kennebago is trout, in plenty and of good size, none of the Rangeley waters furnishing better sport for rod and line.

A party disposed to try the wilderness still further can push on to Seven Ponds, still to the northward, to which Kennebago is about half-way from Rangeley—a locality reached only by the more adventurous sportsmen, and concerning which I know too little to speak with any particularity. From its geographical position and its relation to

such, a specimen of many, is the Kennebago Falls, on the outlet of the Kennebago Lake. This outlet, on its way to the great lakes, joins the outlet of Rangeley Lake at Indian Rock, to which somewhat famous spot we have now to make our way.

The *Mollychunkemunk*, before referred to, whose daily round trips traverse the Rangeley Lake from end to end, is one of a fleet of four little steamers which, with the season of 1876, have extended a line of communication throughout the entire chain of lakes. Captain Howard, the projector and organizer of this useful enterprise, is a young man of grit and genius, and deserves well of travellers through this country for his efforts to promote their convenience and comfort. It was with some misgivings that he launched his undertaking two summers ago, but the result has more than fulfilled his most sanguine hopes. Unless all signs fail, he has laid the foundations of what is to prove a very extensive summer travel through this lake country. The *Mollychunkemunk* leaves Kimball's early in the afternoon, and makes the trip to the Mountain View House, at the foot of the lake, a distance of about ten miles, in an hour and a half, exclusive of time consumed in a stoppage at Rangeley City on the way. The sail is one of extreme beauty. Unless the wind be very high, which is not commonly the case, the lake is comparatively smooth, and often its surface is undisturbed by a single ripple. This supreme stillness is,

however, oftener the feature of the morning, when the mists are yet slowly rolling up the mountain-sides, and the rising sun has not fully dissolved the deep shadows of the night. The boat's course leaves the wild and craggy Ram Island to the south, and hugs closely the northern shore, headland after headland of which rises upon the view, until the protecting lee of Bald Mountain is reached, and the puffing little steamer makes a landing at the Mountain View House, or disembarks her passengers across the cove at the head of the "carry" that leads to Indian Rock.

The Mountain View House is a new hotel, of small dimensions and simple style, opened only the last season, but already a popular resting-place with excursionists going in either direction. Its twenty sleeping-rooms are all lathed and plastered, and its general accom-

modations are sufficient for their purpose. Immense brick fire-places in each of the two sitting-rooms invite the visitor at once to feel at home. The forest comes close up to the house on every side, affording a constant shade, and the lake stretches away at its front, with an abundance of boats for pleasure uses. A rude and stony path, which careful drivers can follow with strong wagons, connects the house with the north shore road, the latter ending at the nearest farmhouse, about a mile away. While threading this path one day last summer one of our party saw an unmistakable young *loup-cervier*, or *loo-cevee*, as the "natives" pronounce the word, making his hasty passage along the upmost log of a log fence: thus closely do the tame and the wild approach each other here.

On a little point just opposite the Mountain View House, enveloped in a grove, is a pretty cottage erected recently by Mr. Theodore Page, a gentleman of Hallowell or its vicinity—one of a number of lovers of the woods who are beginning to establish summer quarters for themselves and their families in these re-

tired precincts. "Lake Point Cottage," as it is called, with its broad veranda, its rustic pil-

AROUND THE CAMP FIRE.

lars, its reddened roof, its cool embowering, and its picturesque approaches, presents an inviting appearance, and is passed at a distance with regret.

The "carry" to Indian Rock, which enters the wood here at the outlet of the lake, nearly opposite the Mountain View House,

is a rough wood road about two miles in length. There is no conveyance across it except for stores and baggage; but the walk is not fatiguing. It is rather a relief after the indolence of a long sail by steam, and the attractions of the forest are new with every step. Now the path touches a little clearing, where remain the "bean poles" of a deserted camp of "river-drivers," as the lumbermen are called; and now it draws for a moment near the stream at a point where a massive dam stems its current, and creates a roar of water which breaks pleasantly upon the prevailing stillness. Again it buries itself in the forest, away from every sight and sound of the work of man, where the startled rabbit darts almost from under your feet to cover, and the affrighted partridge whirs away into a more secure seclusion. The solitude is intense, and the half hour which the walk consumes too quickly passes.

Indian Rock, perhaps the best known locality in this lake country, is the traditional spot where of old the aborigines of the region met in council. It lies at the confluence of the Rangeley and Kennebago streams, and within a half mile of the great Mooselucmaguntic and Cupsuptic lakes, and so was a central and easy place of meeting. The rock itself possesses no imposing qualities, being simply a ledge level with the ground, and not so easily distinguishable from the soil with which it is incrustated. Geologists, however, have found not a little to interest them in its formation. When the writer first visited the spot, now nearly twenty years ago, the only touch of civilization that marked it was a narrow clearing and a homely cabin, wherein a hermit by the name of Smith had made for himself a hunter's and trapper's home, and where the occasional visitor who strayed so far in quest of fish and game could find a little companionship and a few friendly and helpful professional ministrations. Now this same spot, directly across the stream from Indian Rock, presents to the view a well-finished clearing of ten or twenty acres, a productive farm, and a group of tasteful and tidy buildings, half a dozen or more in number. It is now Camp Kenne-

COTTAGE, CUPSUPTIC LAKE.

bago, the thriving and popular headquarters of the Oquossoc Angling Association.

Some years ago a circle of New York and Philadelphia gentlemen, the central figure of which was Jay Cooke, became captivated with the charms of Rangeley and its outlying lakes, and by lease from township proprietors and accompanying legislation from the State, secured valuable and extensive pleasure rights and privileges throughout the region. The Oquossoc Angling Association was incorporated in 1870, and though Jay Cooke has retired from active participation in its concerns, its administration continues. The fine property at Camp Kennebago is of its creation, and the superintendent thereof, Mr. C. T. Richardson, is an agent in its pay. The buildings comprise two large lodging-houses, one for men and the other for women, the agent's house, a barn, and several subordinate structures, the boat-house, giving shelter to fifteen or twenty boats, also belonging to the association. George Sheppard Page, of Stanley, New Jersey, is now its president, and R. C. Allerton, of New York city, its treasurer. The membership numbers between fifty and seventy-five, and meetings for the transaction of business are held at convenient intervals.

The total value of investment at Camp Kennebago is not far from \$20,000. Members, of course, have the first claim upon the privileges afforded at the camp, but after satisfying this demand, its accommodations are open to the public on reasonable terms; and during the months of July and August a great deal of miscellaneous company is entertained. During the fishing season the Oquossocs are apt to "take up their claims" in good numbers.

The fare at Camp Kennebago is surprisingly good, when its distance from the base of supplies is considered. A cup of such

CAMP IN THE WOODS.

English breakfast tea as Mr. Richardson can set before his guests is a luxury not often met with in the woods, or, indeed, any where away from the large cities. The interior of the main camp presents a novel and interesting scene. The long and lofty apartment is dormitory, sitting-room, and office all in one. Two rows of beds along the sides give each sleeper an independent mattress and accompaniments, a spacious table in the centre provides facilities for reading and writing, appropriate pictures adorn the rough

walls, a cabinet organ furnishes the means of musical diversion, and a monstrous open fire-place in one corner is suggestive of the good cheer which follows the laborious sports of the day in the cool evenings of the early summer and autumn.

Indian Rock may be made the resting-place for many days of varied pleasure, or the starting-point for the continued trip on and through the great lake stretch to the southwestward. Of what is before the excursionist in that direction there is no hint whatever on the sunny slope of Camp Kennebago. The forest and the mountains shut in apparently on every side, and only the slow deep waters of the Lackawanna, which quench in themselves the noise and sparkle of the Kennebago and the Rangeley currents, point the way to the broad expanse a little way beyond. The steamer *Oquossoc*, mate to *Mollychunkemunk*, lies waiting at the wharf, and at an early morning hour takes her departure. In five minutes' time she has glided down the few rods of river, and struck boldly out upon the great Mooselucmaguntic toward the Upper Dam. Frye's Cottage, the nest of Hon. William P. Frye, of Lewiston, confronts the eye from its perch upon a rugged islet in the narrows, opposite the mouth of the entering stream, the steamer leaving it on the left as it turns its prow to the southward. The view from this point is sublime and inspiring. To the right the narrows open into Cupsuptic Lake, which thrusts its arms close up under the mountains on the north, lapping their forest-fringed bases with its restless waves, and draining their slopes by one considerable stream, also called the Cupsuptic, navigable by the Indian Rock boats for several miles beyond its mouth. To the south spreads before the eye a much wider and far grander view. As the steamer sweeps past Frye's Lodge and fairly enters Mooselucmaguntic, the magnificent proportions and surroundings of that water are all unfolded to the gaze. For something like a dozen miles the lake extends in the southerly direction, the nearly equal eastern arm being yet concealed from view by an intervening headland. Abruptly to the east rises Bald Mountain, the same which from Rangeley Lake was viewed upon its other side. Mountains there are to match upon the opposite (western) shore, while far to the south the whole horizon is filled with the bold and massive outline of the Bemis range—a chain of noble hills, which, at a greater remove from the overtowering White Mountains, would command a distinguished reputation. As the steamer pushes down the lake, by the aid of a good glass one may discern Allerton Lodge, upon its rocky foundation, under the very edge of Bald Mountain, at a point known as Bugle Cove. This is the haunt of Mr. R. C. Allerton, of New York, the treasurer of the Oquossoc Associa-

tion, and is one of the finest and prettiest lodges on any of these shores. At the extremity of the eastern arm of the lake, occupying an eligible site at the foot of what

have been built at several points, by means of which the water in all of the lakes can be raised to a mean head of eleven feet. This easily sets afloat the logs as they lie

BOAT-LANDING, FOOT OF MOOSELUEMAGUNTIC—UPPER DAM.

is known as the Bemis Stream, is another camp, consisting of a number of cabins, controlled by Mr. George Sheppard Page, Mr. L. L. Crounse, and Mr. H. M. Hutchinson. These gentlemen are lessees of a large tract of surrounding territory, and have greatly interested themselves in the artificial propagation of fish. It is estimated that in 1875, 250,000 trout were spawned in the breeding ponds constructed by them on the Bemis Stream. The L-shaped configuration of Mooseluemaguntic makes practically to the eye two lakes out of the one, and the view from Bemis is quite independent from that presented to the observer at the Cupsuptic narrows. The mountains have shifted positions, and stand in new relations. Islands, before an apparent part of the main-land, are discovered therefrom and established in their independence, and the outlines of the horizon are broken up into forms of fresh beauty.

We are now on the way, in imagination, to the Upper Dam, and it is time to seek a little preparatory information respecting the great commercial interests with which that immense structure and its fellows are connected. The forests which infold the Androscoggin Lakes abound with valuable timber, and the region which in summer is consecrated to the oar and rod and gun, resounds in winter with the strokes of the lumberman's axe. In the spring the timber which has been cut during the preceding months is rafted through the connecting streams into the Androscoggin, and so to the mills, the markets, and the world. To facilitate these operations, immense dams

along the shores, and the drawing off at will aids the process of rafting, as well as furnishes a driving power through the connecting streams and down the Androscoggin. Of these great structures for subduing all this immense water-power, and making it subservient to the lumberman's will, that known as the Upper Dam is at the foot of Lake Mooseluemaguntic, on the stream that empties into Mollychunkemunk, or the upper Richardson Lake. The Middle Dam is at the foot of Welokennebacook, or the lower Richardson Lake, on the stream that flows thence into Umbagog. The third is the Errol Dam, on the Androscoggin itself, below Umbagog, and below the confluence of the Magalloway. The Upper and Middle dams very naturally furnish dividing points to the system, and mark off the stages of the excursionist's route. From Indian Rock to the Upper Dam is a good two hours' trip, the last few minutes of which are consumed in a short "carry" from the landing at the outlet where the steamer puts you ashore.

The Upper Dam may be set down as the central point of the region, though as the boat sails, and the "carry" leads, it may be hardly half-way from the inlet of Rangeley to the outlet of Umbagog. Still he who has penetrated thus far may feel, with reason, that he has reached the heart of the wilderness. What town is he in? No town, but only a township, and unnamed at that. "No. 4, Range 1," is the official designation of his whereabouts. There is no post-office easily accessible nearer than twenty-five or thirty miles; no telegraph, probably, within fifty; no railway station within sixty or seventy. Save the two or three cabins

LAKE MOOSELUCMAGUNTIC.

which are grouped into the "Upper Dam Camp," and the scattered lodges of sportsmen and visitors upon the shores of the lakes around, there can be no human habitation within a dozen miles in a straight line, or double that of the most direct and feasible route. The clearing about the camp, the excellence of the buildings, and the massive frame-work of the dam lessen the sense of solitude at first, but it soon returns, and settles down heavily upon the mind.

The dam is one of the largest and costliest structures of its kind in the State. It is fifteen hundred feet in length, its heavy timber-work being bolted with iron and ballasted with stone, the width of the top being sufficient to be utilized as a roadway. The path to Lake Mollychunkemunk leads across this dam, and finds the rock-edged waters of that lake half a mile away. The scene here in the spring, when the boys are going out, is exciting in the extreme, and at that time the camp is often thronged with interested visitors. The accommodations for the public, though limited, are good, and the spot is an excellent head-quarters for fishermen in the months of June and September.

The Upper Dam may be conveniently taken as the meeting-place of the three routes for entering the lake country, and

having now traced one of them somewhat in detail, the reader may quickly be made acquainted with the other two. At the further extreme from the Rangeley route is that by way of Umbagog, which is reached by a stage ride of about twenty-five miles from Bethel—a station on the Grand Trunk Railroad near the New Hampshire line, and about seventy miles from Portland. Bethel has long been a popular summer resort, noted for the beauty of its scenery. The stage lands the morning's passengers from Boston at a comfortable hotel in Upton, on the Cambridge River, a tributary of Umbagog, at about eleven o'clock the same evening. The next day the steamer *Diamond* furnishes conveyance across the lake and into the mouth of Rapid River, the five-mile stream entering from Welokennebacook, along which a "carry" has to be made to the Middle Dam. This trip can be easily varied by a detour for a little distance into the Androscoggin, as far down as Errol Dam, and thence up the Magalloway to the outlet of Sturtivant's Pond, while the whole region lying along the New Hampshire line abounds with inviting localities. Across the Androscoggin runs the road to the famous Dixville Notch, not more than fifteen or twenty miles away. Up the lonely Magalloway, winding among lofty mountains

DEAD-WOOD FOREST, ABOVE THE UPPER DAM.

and through the densest forests, the more adventurous and experienced woodsman may push in his canoe for seventy miles to Lake Parmachenee, the solitude of which is seldom invaded. Lake Parmachenee is about the size of Kennebago, and only a little above its latitude, but is far less accessible, and therefore comparatively unknown. A well-equipped party, with three weeks to devote to the trip, would doubtless be amply repaid in many ways for the toil it would occasion.

The Middle Dam, to which we now return by way of Umbagog and the Rapid River, is the head-quarters of the Oxford Club, an organization of Portland gentlemen, similar in plan and intent to the Oquosoc Association at Indian Rock. It controls land by lease, and keeps the fishing under

binations. The expression is, however, still the same—that of an imperious and untamed nature. The passage through the narrows which unite the two lakes is tortuous, and in certain seasons of the year, when the water is low, difficult by reason of abounding rocks. Once out of Welokennebacook, and the mountains which stand sentinel-like at the head of Mollychunkemunk, namely, "Observatory" and "Azischohos," rise majestically on the view. The shores are rugged with the wear and tear of storms; for there are often fearful winds on these inland lakes, and waves that toss your boat like a cockleshell. Whitney's Camp, at the foot of Mosquito Brook, and Betton's Camp, near the outlet from Mooselucmaguntic, where the *Simmons* makes its landing, are two more of the private lodges which gentlemen have

SOUTH ARM OF THE WELOKENNEBACOOK.

proper regulations. A camp furnishes good accommodations for the public.

The connecting link of travel between Umbagog and Mooselucmaguntic over the Richardson Lakes is furnished by the steamer *H. B. Simmons*, which runs daily over the triangular route between the Andover arm of Lake Welokennebacook and the Middle and the Upper dams. With this we touch the last of the three ways of entering the region from the outside world. Andover is a town of romantic and delightful situation, a few miles north of the Androscoggin River, which here runs eastward, and is reached by an easy stage-ride from Bryant's Pond, also a station on the Grand Trunk road. It occupies a well-watered plateau, walled in by picturesque hills, through notches in which roads lead to the four points of the compass. The distance from Andover Centre to the arm of the lake is something like a dozen miles, and the road, being rough, is traversed commonly on a "buckboard," an ingenious and serviceable vehicle, the use of which is to most persons a new and pleasurable experience. The sail over lakes Welokennebacook and Mollychunkemunk to the Upper Dam presents entirely new types of scenery to view, the wildness and grandeur of the other lakes being thrown into different com-

binations. built for themselves in this vast wilderness. Betton's is one of the largest and most picturesque and complete in all the region. A short walk from the landing here brings one to the Upper Dam.

The four steamers, *Mollychunkemunk*, *Oquosoc*, *H. B. Simmons*, and *Diamond*, thus form an almost continuous and connecting line of steam communication between the head of Rangeley and the foot of Umbagog lakes—a distance, including the "carries," of between fifty and sixty miles. A more enchanting jaunt it would be hard to imagine. The scenery, sometimes approaching the sublime, is always beautiful, and at many points extremely fine; while the succession of lake and forest and mountain affords an endless variety of shapes and colors and shades. The "carries," save the longest, at Rapid River, afford an agreeable change after an hour or two upon the water; the public-houses are comfortable, and occasionally excellent, and the prices are altogether reasonable. The fares on the steamboats average a dollar each trip, and the rates at the hotels do not exceed two dollars a day. Another season, it is intended to furnish round-trip tickets from Boston, traversing the entire route, and good either way, with liberty to stop over at any point.

Until within a short time hunting and fishing in Maine have been under little or no restriction, but the laws are now ample and strictly enforced. The shooting of moose, deer, and caribou is forbidden between the 1st of January and 1st of October, and the best of the lawful months for taking trout in the Androscoggin waters are June and September. At these times the fishermen are on hand in force, and the public-houses are crowded to their utmost capacity. The months of July, August, and October are the best for the purposes of a general excursion, without reference to piscatorial sport.

October will be found exceedingly cool, and during July and the early days of August the black-fly reigns, so that the visitor has a choice to make between discomforts. The black-fly, however, disappears before advancing civilization, and there are localities among the lakes where he has already ceased to make trouble, and the weary may find rest. As has before been said, no black-flies are found at Rangeley City, which consideration alone must give that spot pre-eminence with many persons for the purposes of a summer sojourn for at least a long time to come.

AZISCOHOS AND OBSERVATORY MOUNTAINS, LAKE MOLLYCHUNKEMUNK.

THE NIEBELUNGEN LAY.

ABOUT the middle of the last century an aged scholar, while rummaging in the library of an old monastery in South Germany, came across a manuscript of great age and unusual length. On examination, the scroll turned out to be a copy of an epic poem, which, after having enjoyed great popularity among the Teutonic races of Europe for generations, had been lost and almost forgotten for nearly three centuries. The happy discoverer took possession of the treasure, and, a short time after, the concern of the world of letters was aroused by the announcement of a newly found production of the earliest period of German literature, which surpassed in literary excellence any hitherto known. This announcement was soon followed and confirmed by the publication of the original poem, and a translation of parts of it in modern German.

Then began the task which up to the present day has not been wholly and satisfactorily completed, namely, the unraveling the history of the great poem—for the manuscript told nothing of its birth nor of its author. Besides these points, there were many

questions concerning the contents of the poem to be solved, all of which were considered so important that the most eminent scholars devoted considerable time and labor to the solution of them. Chief among these investigators and critics were the discoverer of the first manuscript, Professor Bodmer, the Brothers Grimm, and Professor Lachmann, and more recently Gervinus. In the course of the search they and others have prosecuted, at different times and places, for materials which might throw some light over the history of the poem, a dozen or more copies of the epopee itself were found. These later-discovered manuscripts varied in length, in age, and in other particulars from the first and from one another, but agreed generally in being unsigned and undated. Indeed, in several there was not even a title prefixed to the poem; two or three were styled the "*Book of Krimhild*." The so-called Lassburg manuscript ended with the words "*der Niebelungenliet*." It is from this one that the ordinary appellation of the poem, the *Niebelungen Lay*, is derived.

As to when it was written, critics are at last agreed in fixing the date near the beginning of the thirteenth century. But no data have been discovered that can settle the question of authorship. It is generally supposed that the various incidents of the *Lay* formed the themes of as many songs for a long time before the period mentioned above, when some learned minstrel or monk united them to form one connected narrative, which he transferred to writing.

Like the *Iliad* of Homer, the *Niebelungen Lay* is a monument of an epoch in a nation's history—a vivid picture of the social customs, of the religious faith, and of the predominating passions of a race at one period of its existence. These passions were those of war and conquest: from beginning to end the *Lay* resounds with the clash of arms. As regards the mild influence exerted by the new religion of Christ, it is rather felt hovering as an invisible presence over the entire drama than perceived as a strong feature of any one scene in it. Moral superiority, as we understand it, was never the chief characteristic of early heroes of fiction; nor is moral force ever made to outshine or even to compensate for the lack of physical power in the favorites of ancient song.

The hero of the *Niebelungen Lay*, Siegfried, forms no exception to this general type. He is hero chiefly because of surpassing prowess in arms. As for the rest, he is possessed of wondrous beauty, and of the noblest of spontaneous virtues—generosity. Besides these personal endowments, and as the result of them, he is become the possessor of a magic cloak, and (if we may so speak) of a horny skin, which add much to his might, but nothing to his virtue. Although it is not our intention to enter into or pass any opinion on the controversies which this foremost of the *dramatis personæ* of the *Lay* has been the subject of, a fresh, and perhaps a just, interest in the present sketch may be awakened by stating that several learned scholars identify Siegfried with Baldur. In Scandinavian mythology Baldur is the god of light and life, the sun who quickens the seed (the sleeping beauty, Brunhild) and releases it from sleep. This theory is the result of comparisons made between the German epopee and the “Edda,” the most ancient Scandinavian poem. It is chiefly from the latter that Richard Wagner's *Das Niebelungen Ring* trilogy is taken.

Most of the other *dramatis personæ* of the *Lay* have also been identified either with mythological or historical personages. The principal events described in it can likewise be traced in history. Thus Attila is the original of Etzel, Dietrich of Bern is the terrible Theodoric of Verona, while Günther is the German name for Gundicar, King of Burgundy. It is remarkable that these mon-

archs cut much poorer figures in the *Niebelungen Lay* than they do in history. In the year 436 Gundicar, with all his followers, was destroyed by the Huns under Attila. It is this event which is supposed to be represented by the catastrophe of the *Lay*, the outlines of which follow.

In Worms, the capital of Burgundy, reign Günther, Gernot, and Giselher, the Child, the three sons of Dancrat, late puissant king of the land. The chief liegemen of their throne are Hagan, knight of Trony, Dankwart, his brother, and Folker of Alzeia, called the Minstrel, because of his skill in playing the fiddle. The star of the Burgundian court is Krimhild, the only sister of the three kings. She is called the Peerless, and great is the number of redoubted champions who have pledged their service to her beauty and grace. One night Krimhild dreams that she had carefully trained a falcon, sharp-eyed and of glossy hue, when two fierce eagles pounced down on it and killed it. The dream weighs on the maiden's spirit, and when day breaks she seeks her mother, Dame Uta, and tells her about it. The listener interprets the falcon to be the dreamer's predestined husband, whom two enemies will slay. Then Krimhild bursts into tears, and vows she will never, never marry, since she is doomed to suffer woe through man.

But alas for such a vow! Already there are forces working to destroy it.

To distant Netherland has the fame of the beauty of the Burgundian princess spread, and Siegfried, the only son of the rich king of the land, determines to win her for his bride. Disregarding the warnings of his parents, both of whom, on hearing of this new determination, become possessed of dark forebodings on his account, the warrior prince leaves Netherland with only eleven companions. They ride northward seven days before the gates of Worms are reached. Here they ask a Burgundian knight whom they meet, the way to Günther's palace, and then ride on through the city. Their foreign air and magnificent attire do not fail to awaken the curiosity and admiration of the splendor-loving inhabitants, and the news of the strangers' arrival spreads among them till it reaches the palace. Here, in the great hall, the king and many of his retainers are assembled when the little band of foreign knights is seen approaching. A question as to the nationality of the strangers arising among them, which they can not answer, Günther sends for his kinsman Hagan, who has seen all lands and all peoples, to settle the dispute. When the knight of Trony lays eyes on the strangers, he recognizes them as from Netherland, and declares that the stately warrior at their front can be none other than the renowned Siegfried, the mightiest of war-

riors and the conqueror of the Niebelungen. They have never heard of this mighty champion, and ask Hagan to tell them more about him, when he relates that once, when Siegfried was riding alone in the country of the North, he came to a dark ravine, in which a company of giants were assembled around

finish dividing them. This provoked the ire of the two kings, who suddenly sprang up to slay him. But, undaunted, the knight stood his ground, and so great was his quick power in handling the sword, that he slew one after another all of his antagonists. Then he overcame the keeper of the golden

SIEGFRIED DIVIDING THE TREASURE BETWEEN SHILBUNG AND NIEBELUNG.

an enormous heap of gold. When they saw the stranger they asked him to come and divide between their two kings, Shilbung and Niebelung, the treasure they had just brought out of the cavern near at hand. The hero good-naturedly dismounted and undertook the task. But so vast was the heap of golden treasures that he failed to

hoard, Alberic the Dwarf, from whom he took the magic cloak of the Niebelungen. Afterward he was acknowledged king of the Niebelungen Land, which made him the richest and most powerful of all knights.

Hagan further recounts another adventure of Siegfried's with a fire-spitting dragon, which all the country feared and he slew; and how he bathed himself in the monster's blood, which caused his skin to turn to horn, so that no weapon could ever after harm him.

The knight's tales are scarcely ended before the strangers are announced. When presented to King Günther, who is prepared to give his guests friendly welcome, Siegfried throws back his princely head, de-

SIEGFRIED AND THE DRAGON.

claring he is come to conquer Burgundy's kings by his good sword, adding, that if he himself falls in the lists, the hoard and kingdom of Niebelungen Land shall become theirs. Rapid and clear is the champion's speech; the monarchs on the throne and the warriors around it, as they listen to it, flush with various passions of anger, admiration, and suspense. Keen-eyed Hagan is the first to recover himself; he detects what is the real object of Siegfried's desire for conquest. He whispers in the ear of the monarch, whose countenance becomes milder as he listens, and when he ceases, Günther makes pleasant answer to the impetuous youth's address. He says the desired combat between them can be put off till the morrow; in the mean while his noble guests are welcome to Burgundy and to every thing the king's palace contains.

Subdued by this unexpected response, the impulsive prince withdraws his challenge

entirely, and pledges his friendship to his generous host.

Following the Netherland warrior's arrival, numerous tournaments and other martial games take place, in which Siegfried always comes off victorious. But his heart is not in them: his eye has a searching look, alert for the appearance of the fair Krimhild. And Krimhild? She is not permitted to appear at court, nor to be present at the games in which the strangers take part. But nevertheless she sees them often from her windows in the castle tower, and, alas for her vow! unconsciously her heart begins to feel keen interest in all the movements

SIEGFRIED CAPTURING THE MAGIC CLOAK OF THE NIEBELUNGEN.

of the strange champion, and delight in all his conquests.

A twelvemonth is thus spent, by the court in pleasure, by Siegfried in passionate suspense, when one day messengers arrive from the kings of the Danes and of the Saxons with a declaration of war against the Burgundians. Siegfried is overjoyed at the news; he longs for excitement, and petitions Günther to let him march against their enemies. He declares that with the help of but ten thousand warriors he will vanquish the hosts of the allied kings. The monarch gratefully accepts his offers, and so great is the confidence the Burgundians feel in him that the desired number of warriors speedily enlist their services. In a few days all necessary preparations have been made, and they march out of Worms toward the enemies' country. On the way they encounter their foes. Dreadful are the combats that follow; mighty the wonders the Burgundians achieve; bloody the last hand-to-hand encounter between Günther's kinsmen and their royal foes, which ends in the capture of the latter. Then fighting ceases, and a messenger is dispatched to the Burgundian court with tidings of victory. Worms is already astir with joyful excitement when, in the palace, Krimhild summons the herald to her presence. General news of victory does not satisfy her; she longs to hear particular intelligence of the brave Netherland prince, for which end she sends for the messenger and overwhelms him with questions concerning her brothers! How has it fared with Gishelher? and Gernot, has he escaped being wounded? Who had fought most bravely? Had any of their friends been slain? To these short-breathed questions the herald promptly replies that the Netherland prince had fought most bravely, and goes on to state Siegfried's bravest deeds and particulars of his present welfare, to all of which the maiden listens with absorbed attention. When the youth stops speaking, in a tremor of glad excitement she heaps on him presents of gold and vesture, and dismisses him.

We smile, as the sly youth must have smiled, and as the poet did, who, after describing this scene, sagely observes:

"No wonder to rich ladies glad news is gladly told!"

A few days later the triumphant warriors arrive at Worms, bringing with them the kings of Denmark and of Saxony as captives. In their honor a grand festival is announced to take place, to which the ladies of the court are bidden. On this auspicious festive day Siegfried for the first time beholds the object of his passion. Among her maidens Krimhild looks like the moon among stars. Her dazzling beauty overcomes the warrior, who gazes at the princess spell-bound, and

"Inwardly to himself thus thought: how could I ever deem

To win thee as my own? sure 'tis an idle dream!
Yet rather would I die, sweet maid, than leave thee now!

And pale became his cheek, while passion gloomed his brow."

The knight is still absorbed in this passionate contemplation, when a message is brought to him from Günther, bidding him come to the royal circle to receive the salutations of the queen mother and Krimhild, which favor his recent good services had earned. With palpitating heart Siegfried approaches, and receives, according to the manners of the time, the kiss of salutation from the king's sister, which inflamed still more ardently the hero's breast, and bound him more passionately than ever to the peerless maiden's service.

Meanwhile a rumor reaches Worms of the wondrous beauty and strength of Brunhild, the virgin queen of Issland, and of how every suitor for her hand was obliged to abide three combats with her, or else straightway perish. Günther, who is unmarried, and fond of adventure, determines to try his fortune with the martial queen, and asks Siegfried to accompany him to Issland. The hero consents to go, and promises to win the maid for him if he will give him Krimhild. Günther agrees to this proposition, and before long, with a chosen band of warriors, the two princes set out on their journey. A voyage of twelve days brings them to the coast of Issland. Leaving their boat on the shore, they proceed directly to Brunhild's castle, which rises prominently before them, a short distance from the rocky beach. As they draw near, they espy the queen sitting with her maidens in an open lofty hall. Günther at the sight of Brunhild becomes enamored of her beauty, and expresses his feelings to Siegfried. As if conscious of the stranger's glance, the queen shields herself from view, and telling her maidens it ill befits them to stand as a show to the rude eyes of men, she dismisses them. The fair ones immediately repair to their chambers, where they deck themselves in their richest robes, and then hasten to the windows to watch the movements of the strange warriors.

The Burgundians are welcomed by the liegemen of the queen, to whom they announce the object of their visit. They are then presented to Brunhild, who accosts Siegfried by name, and welcomes him to Issland. In response the hero bows deferentially, and, as they had previously arranged, tells her he is only a vassal of Günther, whom she should first have deigned to greet: it is the Burgundian monarch, not himself, who is come to win her hand.

This interview is unsatisfactory, and can be understood only by referring to sundry other legends of Siegfried. From them we

BRUNHILD'S PUNISHMENT OF HER LORD.

learn that the hero in early youth had delivered Brunhild from the fiery circle which her father, the god Wotan (or Odin), in a fit of anger, had caused to kindle round her, and had claimed her as his bride. He afterward left her in search of adventures; here we find him assisting another to win her.

On hearing the words of Siegfried, the queen, without further ceremony, orders the lists to be opened and her harness fetched. When fully equipped in armor, four chamberlains approach, carrying a shield of hammered gold, of such immense size and weight that they stagger under it. At the sight the Burgundians are lost in astonishment, and, as Hagan expresses it, "begin to believe the queen is the devil's wife." But Brunhild, unconcerned, lifts the massive weapon with one hand, and then gives the signal for the beginning of the first trial of skill, which is the hurling of the javelin. Günther trembles as he moves to his place opposite the martial maid. He does not think of Siegfried or the assistance he had promised; but the hero stands at his side in his magic cloak, which rendered him invisible and strong as twelve men. At this critical moment, after announcing his presence to Günther, and bidding him make the proper gestures, he snatches his buckler and receives the queen's mighty blow; then, raising Günther's javelin, he hurls it with such force that Brunhild staggers backward. Then follow the two other feats—the throwing of a stone, which twelve men could

scarcely lift, and the springing after it so as to reach the spot the same instant it touched the ground. In both the martial maid is vanquished. She scarcely grasps the fact; she stands silently gazing at her antagonist, now her lord. Suddenly raising her hand with a gesture of mingled despair and command, she bids her men and kinsmen "to follow her example, and bow low to her better."

Then follows the reluctant departure of the queen from Issland. The party are welcomed back to Burgundy with great magnificence and cordiality. At the banquet which is given in the palace on the evening of the arrival of the bridal party, Siegfried finds occasion to remind Günther of his promise concerning Krimhild. The king asserts his willingness to fulfill it at once, and summons the princess to his presence. When she appears, he tells her of his promise to the Netherland prince, and asks her to release him from it. Krimhild, in response, says that whatever her brother commands her to do she will willingly perform—a reply at once characteristic of a social custom of the time, and of woman's delicate art, for in consenting to marry Siegfried she carefully conceals her own feelings, and affects sisterly obedience as the sole motive of her conduct.

But Siegfried is satisfied.

"He thus to her affianced, and to him the maid;
Straight round the long-sought damsel in blushing
grace array'd;
His arms with soft emotion th' enamored warrior
threw,
And kissed the high-born princess before the
glittering crew."*

Brunhild was not present at this scene; and when, later in the evening, she sees Sieg-

* This stanza and those which subsequently appear are copied from Littsom's English translation of the *Lay*, as edited by Professor Lachmann.

fried seated familiarly at the side of Krimhild, she asks Günther, in a haughty tone, why a lowly vassal is placed so near the sister of the king. At first the monarch evades a direct reply, but the queen threatens and insists, till he confesses that Krimhild had just been wedded to Siegfried, adding that in his own country the knight is a mighty king. He dares not deceive her on the point of Siegfried's being no vassal of his but an independent prince, lest she should suspect him of being guilty of other deceptions, as he was. But Brunhild suspects something is withheld from her, and to punish her husband for his contumely, when they retire to rest that night, she binds him hand and foot with her girdle, and hangs him on a nail in the wall. In this uncomfortable position the king dangles all night. In the morning Brunhild releases him; but whatever relief freedom may be to his limbs, it can not ease his

ing to her, while at the same time he enjoys secrecy respecting it, the story of his struggle with the haughty Brunhild.

The bridal pair do not tarry long in Burgundy; before the wedding festivities are over, they set out for Netherland. They are received by Siegfried's parents and all the people of the land with great rejoicing, which reached its acme when the hero, by the abdication of his father, becomes king. Then follow ten blissful years, when to the puissant monarch and his soft-eyed consort a child is born. They name the little heir Günther, after his uncle, to whom a messenger is at once dispatched with the joyful tidings.

Meanwhile, in Burgundy, Brunhild has been wondering why Siegfried never presented himself at court, as befitted a vassal of the throne. When the messenger arrives at Worms with news of the birth of an heir to the proud knight, this subject is brought

DEATH OF SIEGFRIED.—[SEE PAGE 46.]

heart or lighten his spirits. The king's dejection is the subject of gossip during the day to the whole court. Siegfried alone divines the cause of it, and when an opportunity presents, he speaks to Günther about it; he tells the monarch that Brunhild's magic strength is derived from her girdle and the ring she wore on her right hand. If she could be disarmed of these she would be incapable of resisting him, and he proposes a plan for getting possession of these charmed objects. Günther agrees to it, after some hesitation; so that night, in his magic cloak, Siegfried enters Brunhild's chamber, where, after a long, desperate struggle, he is successful in overcoming her and snatching from her person the magic girdle and ring. Brunhild thought she was contending with Günther, and again "bows low to her better."

Not long after, Siegfried, in a fit of tenderness, gives his wife the trophies, confid-

afresh to her mind. She determines, by what means soever, to lower the vassal king's pride. With this idea animating her passions, she seeks Günther, and tries to awaken his sense of dignity to a point of exasperation at Siegfried's wanton disregard of his duties as their vassal. But the king only smiles at her fretting, and laughs secretly at the notion of the puissant King of Netherland and Niebelungen Land being his vassal. His indifference and paltry excuses for Siegfried's conduct irritate the queen to an intense degree, and strengthen her determination to carry her point. Concealing her rage under a mask of wounded affection, the artful queen, with hesitating step, draws near her lord. Suddenly, locking her arms about his neck, she bends her beautiful head, and while caressing him, with fond looks, entreats him humbly to grant her the boon she asks—the pleasure of greeting once more their lovely sister. She reminds

KRIMHILD LAMENTING OVER SIEGFRIED'S BODY.
[SEE PAGE 47.]

him that their marriages were consummated on the same day, dwelling dotingly on the graces that had won the noble Siegfried, in a manner which re-awakened in the husband's mind the vision of his own bride's loveliness. Gradually he softens into compliance with his wife's views. Netherland is really not so far distant from Burgundy as to prevent intercourse between the two courts. Siegfried might accept an invitation to visit Worms. As Brunhild suggests, he dispatches messengers at once with an invitation to the King of Netherland and his consort, to next midsummer's festival in Worms.

Siegfried accepts the invitation, and at the appointed time comes to Worms, accompanied by King Sigmund, his aged father, and a long train of magnificently dressed retainers. For some days after their arrival the games and festivities occupy the time and mind of all. Brunhild alone is distraught and moody. She is constantly brooding over the lofty bearing of her guests, and can not rest for reason of it. One day it happens that she and Krimhild are looking at some champions tilting in the court-yard of the castle, when the latter, growing excited over the mighty feats accomplished by Siegfried, who is among the players, declares that he who is ever victorious and mightiest should rule Burgundy. In response, Brunhild sarcastically remarks that were none other living, the adorable Siegfried might doubtlessly rule, but, so long as Günther lived, he was but a vassal of the Burgundian king. That the King of Netherland is her brother's liegeman, Krimhild stoutly denies; and the dispute growing warmer, she declares that she will assert her independence that very day by entering the minster before the Burgundian queen. She carries out her threat. When the hour of vespers comes round, she commands her maidens to put on their most gorgeous robes, and then rides to the cathedral, where Brunhild is awaiting her arrival. Dismounting, Krimhild, without deigning to greet her hostess, is about passing into the minster,

when the Burgundian queen commands her to "halt! no vassalless precedeth the lady of the land." Beside herself with rage, Krimhild turns to give utterance to an accusation the most opprobrious that can be applied to a wife, and then rushes into the minster, leaving Brunhild overcome with shame and anger. When she comes out again, the queen stops her, and demands proof of her foul charge. Krimhild, who is come prepared to give it, draws from her finger the ring and from her robe the girdle which Siegfried had given her, and which, if found in the possession of any but the lawful husband, was considered irrefutable proof of a wife's guilt. Brunhild is thunder-struck for a moment; then remembering the incident of her wedding night, she declares that Siegfried robbed her of the girdle. She sends for Günther to compel the Niebelungen king to confess his crime. But Siegfried can not be made to confess; he denies Krimhild's charge, and before the assembled warriors takes an oath, with uplifted hand, to render his denial more emphatic. The Burgundians, who have learned to love and admire the mighty champion, believe in his innocence, and dismiss the subject as a woman's quarrel. But Hagan, the fierce knight of Trony, is not inclined to be appeased by the fair words of a man whom he has cause to hate, because possessed of greater prowess and of greater influence over Günther than himself. When his companions move away, he approaches the weeping queen and swears to avenge her wrongs.

Having conceived a plan of revenge, Hagan confides it to Günther. At first the king refuses to have any thing to do with

it; but his liegeman, by artfully suggesting that, in case Siegfried perishes, he will come in possession of the hero's kingdom, finally induces him to yield his assent to it. The scheme is speedily arranged and in working order. Messengers are hired to come from a distant part of the country with a pretended declaration of hostility from their old enemies, the kings of Danemark and of Saxony. When Siegfried hears the news, he offers his aid to Günther, who accepts it with many expressions of gratitude. Preparations of war immediately begin, and before long are completed. The day before that set for the departure of the warriors from Worms, Hagan presents himself before Krimhild under the pretext of bidding her adieu. He finds the queen overcome with grief at the prospect of being separated for a long period from her husband. The wily knight, by praising Siegfried's well-known courage, which ever leads him into the bloodiest encounters, intensifies this grief into fear for his safety, and by professions of good-will, touches the wife's susceptible heart. In an outburst of tenderness and terror, she entreats him:

"My good friend, Sir Hagan, bear in remembrance still

How much I love my kinsmen, nor ever wished them ill;

For this requite my husband, nor let me vainly long:
He should not pay the forfeit if I did Brunhild wrong.

"My fault, pursued she, sadly, good cause had I to rue;

For it I have fared badly—he beat me black and blue.

Such mischief-making tattle his patience could not brook,

And for it ample vengeance on my poor limbs he took."

After thus bewailing the revelation of one secret confided to her by her husband, she proceeds to disclose a far more important one. In response to Hagan's inquiry as to how he could serve her by protecting her husband, Krimhild refers to his adventure with the dragon, and continues:

"So now I'll tell the secret, dear friend, alone to thee
(For thou, I doubt not, cousin, will keep thy faith with me),

Where sword may pierce my darling, and death sit on the thrust.

See, in thy truth and honor, how full, how firm, my trust!

"As from the dragon's death-wound gushed out the crimson gore,

With the smoking torrent the warrior washed him o'er.

A leaf then 'twixt his shoulders fell from a linden bough:

There only steel can harm him; for that I tremble now."

She further promises, at Hagan's suggestion, to embroider a little cross on Siegfried's surcoat above the vulnerable spot, so that he may know exactly where to protect him from flying javelins. The knight of Trony, elated at the success of his ruse, then hast-

ens to Günther, whom he persuades to permit matters to go on as previously planned. The next day is the one appointed for the departure of the warriors. With the morn the feigned messengers again appear. But this time they bring friendly messages, which the king accepts by declaring further hostile movements on his part shall cease. The assembled warriors, whose enthusiasm had been aroused, received this intelligence with unconcealed disapprobation. To appease them, Günther proposes a grand hunt in the royal forests, to which he particularly invites the Netherland prince. Siegfried is not inclined to go, but disliking to refuse his host, he rides with the rest to the royal hunting ground. Once engaged in the sport, however, he pursues it with passionate zeal, and when, as the sun is sinking in the western heaven, the bugle call signals the hunters to re-assemble, he brings to the meeting-place a greater number of beasts, and fiercer ones, than all the other warriors. When all are assembled, the hungry sportsmen sit down to the repast prepared by the king's domestics. Never before were hunters better served; but to the abundant cheer, wine is lacking. Siegfried is the first to speak of this want. In reply, Hagan states that it is his fault; he thought the repast would be spread in a distant part of the forest, and had sent the wine thither. He adds that a little way off there is a spring of cold water, and proposes they shall run a race to it. Siegfried, good-natured, accepts the apology and the challenge, and with Günther and Hagan he starts on a race to the rill. He is the first to arrive at the spot, but waits for the king to come up and drink before satisfying his own thirst. When Günther is done drinking, the hero lays aside his weapons and kneels down to drink. A rapid sign passes between Günther and Hagan; the former hastily shoves the warrior's sword beyond his reach, while Hagan, seizing his spear, hurls it with all his power at the faint cross embroidered on Siegfried's surcoat. The deadly weapon pierces the corselet, and remains sticking between the shoulders of the warrior. With a cry, he starts up and grasps for his sword. It has been removed; but his shield is within reach. In an instant that is in his grasp; another, and the weapon is whirling through the air after the flying assassin. Hagan is felled by the blow, which resounds through the forest, and brings the rest of the warriors to the spot. The dying hero had expended his last strength in the tremendous blow; now, writhing with pain, he "falls among the flowerets." Once, starting up, he motions Günther to approach, whom he entreats as a brother and a knight to protect the wife he leaves behind. Death freezes the hero's lips while this tender entreaty still hovers on them.

HAGAN AND THE SWAN-MAIDENS.—[SEE PAGE 48.]

Silently the warriors gather round the dead champion. Hagan boldly proclaims himself the avenger of Queen Brunhild; but they suspect the part Günther has also had in the traitorous deed, so constrain their feelings of horror and sympathy. At night-fall they wend their way back to Worms. All the ladies of the court are retired for the night when they arrive at the castle; so the fierce Hagan, who is bent on making his revenge as terrible as possible, orders his men to throw the dead king before the door of Queen Krimhild's chamber. Day is just breaking on the following morning when Krimhild, preceded by a chamberlain, steps across the threshold of her chamber on her way to early mass. Suddenly the chamberlain stumbles, and the light he holds in his hand flickers and goes out. But the queen by the last flickering flame had discerned the outlines of the object at their feet. Like a lightning flash that last interview with traitorous Hagan darts through her mind, together with a revelation of its sequel—the assassination of the beloved husband whose se-

cret she had revealed. Uttering a cry of remorse and despair that pierces every wall in the castle and freezes the blood of every occupant, the unconscious wife drops down on the body of her slain husband.

Black are the days of woe and mourning that follow. The stricken queen remains at the side of her dear lord's bier, till they forcibly lead her away in order to bury the dear champion from sight. When at last all the ceremonies of mourning and burial are over, the hero's kinsmen and followers depart for Netherland. They can not persuade their queen to accompany them; she refuses to leave her lord's grave for his child. She remains to weep his loss—and to revenge his death.

Here closes the first part of the *Lay*. The second part, which is of about the same length as the first (each contains more than two thousand stanzas), is styled the *Niebelungen Noth*, or Calamity. It extends over a period of twenty-one or twenty-two years, and transfers the scenes of the principal events from Burgundy to Hunland (Hungary).

Thirteen years have passed by since Siegfried's death, during which his murderer had forced from his widow the precious Niebelungen hoard, and so intensified her hatred of him, when ambassadors from the King of Hunland arrive at Worms. They have been sent by Etzel (Attila), who had recently lost his wife, to sue for the hand of the still beautiful Krimhild. Their suit is at first rejected with contempt by Siegfried's widowed queen; but at last the devoted Margrave of Austria, by promising that her "past wrongs shall be amended," draws from her a reluctant consent to his master's proposals. After a short delay, spent in preparing suitable vesture, Krim-

hild sets out with the Hunnish knights for Etzel's land. Finding herself thus a beloved wife and mother, an idolized mistress and queen, Krimhild, whose heart is in Siegfried's grave and whole mind on revenge, at last attempts the accomplishment of her vindictive plans. One day Etzel is caressing her in a fond mood, when she tenderly upbraids him for never showing her Burgundian kinsmen how honored in Hunland is Etzel's wife. The king protests, and declares he will send for them at once to visit his court, that they may see how innumerable are the redoubted champions who do service to their throne.

In spite of the violent expostulations of Hagan, who in Krimhild's invitation to vis-

it Hunland suspects some mischief, Günther returns word by the Hunnish messengers that he and his kinsmen will accept the invitation to come to Etzel's land. Brunhild declines the invitation. But Hagan at least succeeds in inducing the fraternal kings to take with them a large number of warriors as bodyguards. He himself, although convinced that all are going to meet death, persists in joining the party as guide, for he alone knows the way to Etzel's castle in Hunland. Twelve days they travel eastward, when their progress is stayed by the river Danube, which recent rain-falls have rendered unfordable. In this emergency Hagan calls to mind that further up the stream dwells a ferry-man. Telling his companions to wait there while he rides to the boatman's hut, he disappears in the forest. There the mossy sod is so soft that the warrior's progress is scarcely audible, and hence he hears the splash of three merry bathers, in a little stream which he comes to before he has proceeded far on his way, ere they have any warning of his approach. The knight has even time to dismount, and steal noiselessly to the spot where they had thrown off

their garments, before the mermaids* discover him. When they do become aware

GÜNTHER'S HEAD BROUGHT TO HAGAN.—[SEE PAGE 51.]

hild sets out with the Hunnish knights for Etzel's land. On their arrival her marriage with the barbarian king is consummated.

Seven years the royal couple live together in harmony. Krimhild, by suiting her habits to those adopted by her Hunnish kinsmen, by prudent generosity and affability, had become the idolized mistress of all the ladies of the court and of all the war-

* In the original they are called the "wise ladies," and are supposed to be identical with the swan-maidens of Teutonic legends. The latter term was probably taken from the garments of these ideal creatures, which were of swan's-down, or else had the property of enabling their wearers to fly away like those birds when attacked.

of the stranger's presence, and perceive their garments in his hands, they swim down to him; and while floating in the water before him, one of the wise maidens offers to reveal the future of the knight and his companions if he will render up their garments. Hagan agrees; whereupon she tells him that the Burgundians may ride without fear to Etzel's land—great honor awaits them there. The knight, as he had promised, hands back their raiment, and is about riding away in lighter mood, when one of the other two maidens calls him back. She declares her aunt has lied to him in order to get back the garments: the truth is, death awaits every man of the Burgundians, except the king's chaplain, in Hunland. Hagan is furious, but not minding his reproaches, she good-naturedly goes on to inform him how to find and subdue the ferry-man he seeks. She tells him that he is a faithful servant of the surly lord who rules over the land on the opposite side of the river; he has been commanded not to ferry any stranger over the river, and can be made to do so only by stratagem. The knight would probably find him paddling on the river; from the shore he must call out loudly that he is Almerich (an ally of the lord of the land), and wishes to be ferried across the river.

And, indeed, when Hagan arrives at the river's edge, he does see the ferry-man paddling in the stream. So he calls out, as the wise maiden had directed, that he wishes to be ferried over the river; he is Almerich! At the mention of this name the ferry-man begins rowing toward the shore, but he no sooner reaches the bank than he discovers the trick practiced on him. With an oath, he begins to row away again, when Hagan, with a bound, leaps into the boat. The surly fellow raises his oar to strike down the intruder; but the knight, perceiving his intention, draws his sword, and with one blow lays him dead at his feet. The grim warrior casts the dead body overboard; then takes the oar in hand and rows down the stream to his companions. To their exclamations of surprise at his coming alone, he states that he found the boat in a low meadow land, and had taken possession of it to transport them and their effects across the river. To this work of transportation they set themselves at once, but it is late afternoon before it is finished. When on the point of again mounting their steeds to pursue their journey, Hagan's eyes accidentally fall on the king's chaplain, seated on a relique chest near the river's edge. A quick thought rushes through the warrior's mind: he will render false the wise maiden's prophecy! With a bound he is at the chaplain's side; an instant, and the priest is struggling in the water. The drowning man cries for help, but the stern knight forbids, and none

dares defy him. At last, by mighty exertion on his own part, and by God's almighty hand, the holy man reaches the opposite shore. Woe pierces the bold warrior's heart when he beholds the chaplain's escape; it convinces him of the truth of the maiden's and of his own heart's prophecy. Whirling on his heel, he strides down to the river, and seizing the shallop which lay secured there, he breaks it in piecemeal; then, addressing his companions, he tells them of the wise maiden's prophecy, and declares he destroyed the boat to destroy the hope of escape any coward among them might entertain. But no one cherishes a desire to escape their common doom. With one accord they accept it, with the grim determination to die as they had lived—like brave warriors.

So they wend on their way. At night-fall they are attacked by the lord of the land, with an armed band of followers. He seeks vengeance for his murdered ferry-man. In the fight which ensues, the band is routed by the Burgundians, and their chief slain.

On the following day the warriors arrive at Passau, where they tarry one day with its bishop, Pilgrim, the uncle of the Burgundian monarchs. On the boundary of Austria they are met by Margrave Rudiger, who invites them to his castle, where their whole party is feasted four days. At one of the grand banquets the Margrave's fair daughter appears. The knights are so enchanted by the graceful vision that they propose Gishelher shall marry the young Margravine. After some hesitation on the Margrave's part, who reminds them that he is an exile from his own country, and in Austria but a vassal of King Etzel, the betrothal of the young pair is consummated. The warriors depart, promising to stop on the return to take with them Gishelher's fair bride.

Soon after, they arrive at their ultimate destination, where they are received by the Hunnish king with great cordiality. But Krimhild deigns to greet none but Gishelher. The fierce knight of Trony marks the slight, and takes warning from it. An occasion offering itself, he shows his anger and contempt for the queen by remaining seated in her presence, and persuading his companion, the terrible Folker, the Minstrel, to follow his example. The Huns who witness this insult to their mistress are overcome with indignation, but their loyalty pales before the fear the two strange warriors inspire. They put off revenge till night shall come on, when the strangers can be attacked and slain in their beds. But this traitorous design is suspected by Trony's bold knight, and frustrated by his keeping watch all night long, with Folker, before the doors of their companions' apartments.

The next morning the festivities held in honor of the strangers' arrival begin with a

grand tournament. So skilled in arms are Günther's men that all the Hunnish warriors who venture in the lists against them are vanquished. Hagan grows tired of the easy sport at length, and begins to scoff at King Etzel's men, when a knight of proud bearing and great beauty enters the lists. Folker is seized with sudden fury at the sight, and before the stranger can prepare for action, he rushes upon him and savagely pierces him through with his lance. This outrageous act inspires horror and indignation alike in Burgundians and Huns, and the latter are about rushing in a body on the perpetrator of it, when Etzel peremptorily commands them to lay down their swords; the deed, he declares, was a misadventure, and his guest innocent of any guilty intention. The pending conflict between the two irritated peoples is thus once more delayed.

But how admirably do her enemies serve the Hunnish queen's purpose; indeed, they themselves seem to invite destruction to fall on their heads.

Still Krimhild can not trust to a general, unpremeditated uprising against the insulting crew of Burgundian warriors; by every means in her power she tries to irritate her Hunnish liegemen; and by recounting the wrongs she had suffered at the strangers' hands, she endeavors to win to her service the chief of her husband's kinsmen. The lofty-minded Dietrich of Bern and Margrave Rudiger indignantly refuse to take any part in, and threaten to reveal, her traitorous designs; but Bloodel, King Etzel's brother, is brought to promise he will attack the strangers at the first opportunity, by the engagement on Krimhild's part to bestow on him a beauteous bride and a much-coveted castle.

Evening finds King Etzel and his court, with the most noble of his guests, in the grand banquet hall of the castle; those whose rank does not entitle them to a seat at the royal board are entertained in a distant hall. The king is in high good humor, and, desirous of proving his friendly feelings for his guests, he has his young son Ortlieb brought to him. He then presents the boy to Günther, asking the Burgundian monarch to take the child and rear him at his court. The little prince is being presented from one table to another, when a dreadful tumult is heard without, and arrests the attention of all present.

While at the royal board all have been engaged in feasting in the distant banquet hall, Bloodel and his men had fallen on the Burgundians under Dankwart, Hagan's brother; from the terrible conflict which had ensued Dankwart had escaped, after slaying the chief of his perfidious foes, and now rushes into the royal banquet hall to warn his companions of their danger. At

the first sound of his voice Hagan starts to his feet. Commanding his brother to guard the door, the fierce knight strides to a table near by, where he snatches from Krimhild's arms the little Ortlieb, whose head he strikes off with his sword and throws into the mother's lap. This act is the signal for the beginning of a terrible conflict between the Huns and Burgundians, which, after raging till the floor of the hall is covered everywhere with heaps of slain warriors, is checked by the command of Hagan at the supplication of Dietrich of Bern, who is permitted to lead from the ghastly scene the Hunnish king and his consort, and then recommences with insatiable fury. At last, of all the Huns who sat at the royal board not one remains alive, and the redoubted Burgundians begin to rest their swords; but Gishelher—the Child no longer, for the taste of blood has transformed him into a ferocious animal, arouses them to fling from their presence the bodies of their traitorous foes. So they throw open the doors of the hall, and cast down the stone steps the dead and dying Huns. A wail burst from the warriors assembled without. Urged on by their chiefs and by their own passions, they endeavor to ascend into the hall. But Folker and Hagan guard the platform, and hew down every man who ventures against them.

After watching from a distance the vain efforts of her liegemen, Krimhild commands the hall to be set on fire. Soon the flames begin to dart and crackle around the Burgundian warriors, and to lick with scorching tongues their armor and heat it into softness. Dreadful are the red-tongued furies, dreadful the internal burning, which at last drives the warriors to cut fresh gashes in the bodies of the slain, and to drink the wet blood which gushes from the wounds.

To such pictures as this, of almost beastly ferocity, there is no end. The seven final chapters of the *Lay* abound with them. But in the midst of these scenes of cruel bloodshed occurs an episode unsurpassed in literature for lofty pathos. It is that which describes the coming of the Margrave Rudiger, the noblest of all knights, "whose heart gives virtues birth, as meadows grass and flowerets in the sweet month of May;" his controversy with Krimhild, who demands now the fulfillment of the promise given her when, as ambassador, he came to Worms to woo her, and when the knight replies that he pledged his service and life, but not his soul; his interviews with Etzel, whom he asks to take back every thing his royal liberality has bestowed, and release him from the duty to obey his lord's commands against his conscience; his despair when the king persists in supplicating his help; his subsequent attack on the Burgundians, which he preludes with words of just and noble sentiment, and by a last act of gener-

osity (he gives Hagan his own shield to replace the warrior's broken one); his brave deeds, and his death. The blow that lays low the noble knight is struck by Gernot, with the very same sword the Margravine had presented to him on leaving Austria. Universal is the wail that rises when Rudiger falls; within the charred walls of the hall the remaining Burgundians spread out the rigid limbs and cover them reverently, and when, without, their foes cry aloud for the body, they lift it up carefully and deliver it to Etzel's men. Then, once more, the contest rages. Dietrich of Bern now for the first time leads on his men to avenge brave Rudiger's death. He no longer hesitates for any sentiment of honor; rage gives to his arm a power as mighty as that possessed by the desperate strangers. One by one they fall, till at last only Hagan and Günther remain. Then he leads as captives to Krimhild, from whom he exacts a solemn promise that these mightiest of warriors shall suffer no harm.

But the queen has yearned too long and too fiercely for this moment to reflect an instant on keeping sacred this promise. She orders both warriors to be imprisoned in separate dungeons, whither she repairs soon after. Outrage inflicted on the one passion of this woman's affectionate nature has changed the once gentle maiden and wife into an almost fiend. How now does she

gloat over her captive's misery! When she demands of him to reveal where in the Rhine the Niebelungen hoard, which was Siegfried's morning gift to her, is sunken, and he refuses on the ground that he has pledged his royal masters not to do so while they live, how coldly she turns to a servant and commands him to fetch hither her royal brother's head! And when the bloody member is brought, and although now not one of his masters live, the knight still refuses to reveal the secret, how like a tiger does she spring on him, and wrenching from his grasp Siegfried's sword, sever with it the mocker's head from the shoulders! Siegfried's sword! how tightly the maddened woman, unconscious of the deed she has just wrought with it, clasps the hallowed weapon to her bosom, heedless of the wounds the sharp blade cuts in naked hands and bosom! Etzel shudders at the sight, so overcome with horror that he makes no attempt to stay the hand of Dietrich of Bern's man, who, to avenge his master, who had pledged Hagan his prompt release, rushes forward and slays the traitorous queen. Here ends the *Niebelungen Lay*. To several of the manuscript copies of it there is a third part attached, styled the *Plage*, or Lament. This addition, however, is supposed to be quite modern, and consequently is not included in our sketch of the original old German epic.

EREMA; OR, MY FATHER'S SIN.

CHAPTER XXX.

COCKS AND COXCOMBS.

MAJOR HOCKIN brought the only fly as yet to be found in Bruntsea, to meet me at Newport, where the railway ended at present, for want of further encouragement.

"Very soon you go," he cried out to the bulkheads, or buffers, or whatever are the things that close the career of a land-engine. "Station-master, you are very wise in putting in your very best cabbage plants there. You understand your own company. Well done! If I were to offer you a shilling apiece for those young early Yorks, what would you say, now?"

"Weel, a think I should say nah, Sir," the Scotch station-master made answer, with a grin, while he pulled off his cap of office and put on a dissolute Glengary. "They are a veery fine young kail, that always pays for planting."

"The villain!" said the Major, as I jumped into the fly. "However, I suppose he does quite right. Set a thief to watch a thief. The company are big rogues, and he tries to be a bigger. We shall cut through his garden in about three months, just when his cabbages are getting firm, and their value

will exceed that of pine-apples. The surveyor will come down and certify, and the 'damage to crops' will be at least five pounds, when they have no right to sow even mustard and cress, and a saucepan would hold all the victuals on the land."

From this I perceived that my host was as full of his speculative schemes as ever; and soon he made the driver of the one-horse fly turn aside from the unfenced road and take the turf. "Coachman," he cried, "just drive along the railway; you won't have the chance much longer."

There was no sod turned yet and no rod set up; but the driver seemed to know what was meant, and took us over the springy turf where once had run the river. And the salt breath of the sea came over the pebble ridge, full of appetite and briskness, after so much London.

"It is one of the saddest things I ever heard of," Major Hockin began to say to me. "Poor Shovelin! poor Shovelin! A man of large capital—the very thing we want. It might have been the making of this place. I have very little doubt that I must have brought him to see our great natural advantages—the beauty of the situation, the salubrity of the air, the absence of all clay,

or marsh, or noxious deposit, the bright crisp turf, and the noble underlay of chalk, which (if you perceive my meaning) can not retain any damp, but transmits it into sweet natural wells. Why, driver, where the devil are you driving us?"

"No fear, your honor. I know every trick of it. It won't come over the wheels, I do believe, and it does all the good in the world to his sand-cracks. Whoa-ho, my boy, then! And the young lady's feet might go up upon the cushion, if her boots is thin, Sir; and Mr. Rasper will excuse of it."

"What the"—something hot—"do you mean, Sir?" the Major roared over the water, which seemed to be deepening as we went on. "Pull out this instant; pull out, I tell you, or you shall have three months' hard labor. May I be d——d now—my dear, I beg your pardon for speaking with such sincerity—I simply mean, may I go straight-way to the devil, if I don't put this fellow on the tread-mill. Oh, you can pull out now, then, can you?"

"If your honor pleases, I never did pull in," the poor driver answered, being frightened at the excitement of the lord of the manor. "My orders was, miss, to drive along the line coming on now just to Bruntsea, and keep in the middle of that same I did, and this here little wet is a haxident—a haxident of the full moon, I do assure you, and the wind coming over the sea, as you might say. These pebbles is too round, miss, to stick to one another; you couldn't expect it of them; and sometimes the water here and there comes a-leaking like through the bottom. I have seed it so, ever since I can remember."

"I don't believe a word of it," the Major said, as we waited a little for the vehicle to drain, and I made a nosegay of the bright sea flowers. "Tell me no lies, Sir; you belong to the West Bruntseyans, and you have driven us into a vile bog to scare me. They have bribed you. I see the whole of it. Tell me the truth, and you shall have five shillings."

The driver looked over the marshes as if he had never received such an offer before. Five shillings for a falsehood would have seemed the proper thing, and have called for a balance of considerations, and made a demand upon his energies. But to earn five shillings by the truth had never fallen to his luck before; and he turned to me, because I smiled, and he said, "Will you taste the water, miss?"

"Bless me!" cried the Major, "now I never thought of that. Common people have such ways about things they are used to! I might have stood here for a month, and never have thought of that way to settle it. Ridiculously simple. Give me a taste, Erema. Ah, that is the real beauty of our coast, my dear! The strongest proportion

of the saline element—I should know the taste of it any where. No sea-weed, no fishy particles, no sludge, no beards of oysters. The pure, uncontaminated, perfect brine, that sets every male and female on his legs, varicose, orthopedic—I forget their scientifics, but I know the smack of it."

"Certainly," I said, "it is beautifully salt. It will give you an appetite for dinner, Major Hockin. I could drink a pint of it, after all that smoke. But don't you think it is a serious thing for the sea itself to come pouring through the bottom of this pebble bank in this way?"

"Not at all. No, I rather like it. It opens up many strictly practical ideas. It adds very much to the value of the land. For instance, a 'salt-lick,' as your sweet Yankees call it—and set up an infirmary for foot and mouth disease. And better still, the baths, the baths, my dear. No expense for piping, or pumping, or any thing. Only place your marble at the proper level, and twice a day you have the grand salubrious sparkling influx of ocean's self, self-filtered, and by its own operation permeated with a fine siliceous element. What foreign mud could compete with such a bath?"

"But supposing there should come too much of it," I said, "and wash both the baths and the bathers away?"

"Such an idea is ridiculous. It can be adjusted to a nicety. I am very glad I happened to observe this thing, this—this noble phenomenon. I shall speak to Montague about it at once, before I am half an hour older. My dear, you have made a conquest; I quite forgot to tell you; but never mind that for the present. Driver, here is half a crown for you. Your master will put down the fly to my account. He owes me a heriot. I shall claim his best beast, the moment he gets one without a broken wind."

As the Major spoke, he got out at his own door with all his wonted alacrity; but instead of offering me his hand, as he always had done in London, he skipped up his nine steps, on purpose (as I saw) that somebody else might come down for me. And this was Sir Montague Hockin, as I feared was only too likely from what had been said. If I had even suspected that this gentleman was at Bruntlands, I would have done my utmost to stay where I was, in spite of all absence of money. Betsy would gladly have allowed me to remain, without paying even a farthing, until it should become convenient. Pride had forbidden me to speak of this; but I would have got over that pride much rather than meet this Sir Montague Hockin thus. Some instinct told me to avoid him altogether; and having so little now of any other guidance, I attached, perhaps, foolish importance to that.

However, it was not the part of a lady to be rude to any one through instinct; and I

knew already that in England young women are not quite such masters of their own behavior as in the far West they are allowed to be. And so I did my best that, even in my eyes, he should not see how vexed I was at meeting him. And soon it appeared that this behavior, however painful to me, was no less wise than good, because both with my host and hostess this new visitor was already at the summit of all good graces. He had conquered the Major by admiration of all his schemes and upshots, and even offering glimmers of the needful money in the distance; and Mrs. Hockin lay quite at his feet ever since he had opened a hamper and produced a pair of frizzled fowls, creatures of an extraordinary aspect, toothed all over like a dandelion plant, with every feather sticking inside out. When I saw them, I tried for my life not to laugh, and biting my lips very hard, quite succeeded, until the cock opened up a pair of sleepy eyes, covered with comb and very sad inversions, and glancing with complacency at his wife (who stood beneath him, even more turned inside out), capered with his twiggy legs, and gave a long, sad crow. Mrs. Hockin looked at him with intense delight.

"Erema, is it possible that you laugh? I thought that you never laughed, Erema. At any rate, if you ever do indulge, you might choose a fitter opportunity, I think. You have spoiled his demonstration altogether—see, he does not understand such unkindness—and it is the very first he has uttered since he came. Oh, poor Fluffsky!"

"I am very, very sorry. But how was I to help it? I would not, on any account, have stopped him if I had known he was so sensitive. Fluffsky, do please to begin again."

"These beggars are nothing at all, I can assure you," said Sir Montague, coming to my aid, when Fluffsky spurned all our prayers for one more crow. "Mrs. Hockin, if you really would like to have a fowl that even Lady Clara Crowcombe has not got, you shall have it in a week, or a fortnight, or, at any rate, a month, if I can manage it. They are not to be had except through certain channels, and the fellows who write the poultry books have never even heard of them."

"Oh, how delighted I shall be! Lady Clara despises all her neighbors so. But do they lay eggs? Half the use of keeping poultry, when you never kill them, is to get an egg for breakfast; and Major Hockin looks round and says, 'Now is this our own?' and I can not say that it is; and I am vexed with the books, and he begins to laugh at me. People said it was for want of chalk, but they walk upon nothing but chalk, as you can see."

"And their food, Mrs. Hockin. They are walking upon that. Starve them for a

week, and forty eggs at least will reward you for stern discipline."

But all this little talk I only tell to show how good and soft Mrs. Hockin was; and her husband, in spite of all his self-opinion, and resolute talk about money and manorial dues, in his way, perhaps, was even less to be trusted to get his cash out of any poor and honest man.

On the very day after my return from London I received a letter from "Colonel Gundry" (as we always called the Sawyer now, through his kinship to the Major), and, as it can not easily be put into less compass, I may as well give his very words:

"DEAR MISS REMA,—Your last favor to hand, with thanks. Every thing is going on all right with us. The mill is built up, and goes better than ever; more orders on hand than we can get through. We have not cracked the big nugget yet. Expect the government to take him at a trifle below value, for Washington Museum. Must have your consent; but, for my part, would rather let him go there than break him. Am ready to lose a few dollars upon him, particularly as he might crack up all quartz in the middle. They offer to take him by weight at three dollars and a half per pound below standard. Please say if agreeable.

"I fear, my dear, that there are bad times coming for all of us here in this part. Not about money, but a long sight worse; bad will, and contention, and rebellion, perhaps. What we hear concerning it is not much here; but even here thoughts are very much divided. Ephraim takes a different view from mine; which is not a right thing for a grandson to do; and neighbor Sylvester goes with him. The Lord send agreement and concord among us; but, if He doeth so, He must change his mind first, for every man is borrowing his neighbor's gun.

"If there is any thing that you can do to turn Ephraim back to his duty, my dear, I am sure that, for love of us, you will do it. If Firm was to run away from me now, and go fighting on behalf of slavery, I never should care more for naught upon this side of Jordan; and the new mill might go to Jericho; though it does look uncommon handsome now, I can assure you, and tears through its work like a tiger.

"Noting symptoms in your last of the price of things in England, and having carried over some to your account, inclosed please to find a bill for five hundred dollars, though not likely to be wanted yet. Have a care of your money, my dear; but pay your way handsome, as a Castlewood should do. Jowler goes his rounds twice a day looking for you; and somebody else never hangs his hat up without casting one eye at the corner you know. Sylvester's girl was over here last week, dashing about as

usual. If Firm goes South, he may have her, for aught I care, and never see saw-mill again. But I hope that the Lord will spare my old days such disgrace and tribulation.

"About you know what, my dear, be not overanxious. I have been young, and now am old, as the holy Psalmist says; and the more I see of the ways of men, the less I verily think of them. Their good esteem, their cap in hand, their fair fame, as they call it, goes by accident, and fortune, the whim of the moment, and the way the clever ones have of tickling them. A great man laughs at the flimsy of it, and a good one goes to his conscience. Your father saw these things at their value. I have often grieved that you can not see them so; but perhaps I have liked you none the worse, my dear.

"Don't forget about going South. A word from you may stop him. It is almost the only hope I have, and even that may be too late. Suan Isco and Martin send messages. The flowers are on your father's grave. I have got a large order for pine cradles in great haste, but have time to be,

"Truly yours, SAMPSON GUNDRY."

That letter, while it relieved me in one way, from the want of money, cost me more than ten times five hundred dollars' worth of anxiety. The Sawyer had written to me twice ere this—kind, simple letters, but of no importance, except for their goodness and affection. But now it was clear that when he wrote this letter he must have been sadly put out and upset. His advice to me was beyond all value; but he seemed to have kept none at home for himself. He was carried quite out of his large, staid ways when he wrote those bitter words about poor Firm—the very apple of his eye, as the holy Psalmist says. And, knowing the obstinacy of them both, I dreaded clash between them.

CHAPTER XXXI.

ADRIFT.

HAVING got money enough to last long with one brought up to simplicity, and resolved to have nothing to do for a while with charity or furnished lodgings (what though kept by one's own nurse), I cast about now for good reason to be off from all the busy works at Bruntsea. So soon after such a tremendous blow, it was impossible for me to push my own little troubles and concerns upon good Mr. Shovelin's family, much as I longed to know what was to become of my father's will, if any thing. But my desire to be doing something, or, at least, to get away for a time from Bruntsea, was largely increased by Sir Montague Hockin's strange behavior toward me.

That young man, if still he could be called

young—which, at my age, scarcely seemed to be his right, for he must have been ten years older than poor Firm—began more and more every day to come after me, just when I wanted to be quite alone. There was nothing more soothing to my thoughts and mind (the latter getting quiet from the former, I suppose) than for the whole of me to rest a while in such a little scollop of the shingle as a new-moon tide, in little crescents, leaves just below high-water mark. And now it was new-moon tide again, a fortnight after the flooding of our fly by the activity of the full moon; and, feeling how I longed to understand these things—which seem to be denied to all who are of the same sex as the moon herself—I sat in a very nice nick, where no wind could make me look worse than nature willed. But of my own looks I never did think twice, unless there was any one to speak of such a subject.

Here I was sitting in the afternoon of a gentle July day, wondering by what energy of nature all these countless pebbles were produced, and not even a couple to be found among them fit to lie side by side and purely tally with each other. Right and left, for miles and miles, millions multiplied into millions; yet I might hold any one in my palm and be sure that it never had been there before. And of the quiet wavelets even, taking their own time and manner, in default of will of wind, all to come and call attention to their doom by arching over, and endeavoring to make froth, were any two in sound and size, much more in shape and shade, alike? Every one had its own little business, of floating pop-weed or foam bubbles or of blistered light, to do; and every one, having done it, died and subsided into its successor.

"A trifle sentimental, are we?" cried a lively voice behind me, and the waves of my soft reflections fell, and instead of them stood Sir Montague Hockin, with a hideous parasol.

I never received him with worse grace, often as I had repulsed him; but he was one of those people who think that women are all whims and ways.

"I grieve to intrude upon large ideas," he said, as I rose and looked at him, "but I act under positive orders now. A lady knows what is best for a lady. Mrs. Hockin has been looking from the window, and she thinks that you ought not to be sitting in the sun like this. There has been a case of sun-stroke at Southbourne—a young lady meditating under the cliff—and she begs you to accept this palm leaf."

I thought of the many miles I had wandered under the fierce Californian sun; but I would not speak to him of that. "Thank you," I said; "it was very kind of her to think of it, and of you to do it. But will it be safe for you to go back without it?"

"Oh, why should I do so?" he answered, with a tone of mock pathos which provoked me always, though I never could believe it to be meant in ridicule of me, for that would have been too low a thing; and, besides, I never spoke so. "Could you bear to see me slain by the shafts of the sun? Miss Castlewood, this parasol is amply large for both of us."

I would not answer him in his own vein, because I never liked his vein at all; though I was not so entirely possessed as to want every body to be like myself.

"Thank you; I mean to stay here," I said; "you may either leave the parasol or take it, whichever will be less troublesome. At any rate, I shall not use it."

A gentleman, according to my ideas, would have bowed and gone upon his way; but Sir Montague Hockin would have no rebuff. He seemed to look upon me as a child, such as average English girls, fresh from little schools, would be. Nothing more annoyed me, after all my thoughts and dream of some power in myself, than this.

"Perhaps I might tell you a thing or two," he said, while I kept gazing at some fishing-boats, and sat down again, as a sign for him to go—"a little thing or two of which you have no idea, even in your most lonely musings, which might have a very deep interest for you. Do you think that I came to this hole to see the sea? Or that fussy old muff of a Major's doings?"

"Perhaps you would like me to tell him your opinion of his intellect and great plans," I answered. "And after all his kindness to you!"

"You never will do that," he said; "because you are a lady, and will not repeat what is said in confidence. I could help you materially in your great object, if you would only make a friend of me."

"And what would your own object be? The pure anxiety to do right?"

"Partly, and I might say mainly, that; also an ambition for your good opinion, which seems so inaccessible. But you will think me selfish if I even hint at any condition of any kind. Every body I have ever met with likes me, except Miss Castlewood."

As he spoke he glanced down his fine amber-colored beard, shining in the sun, and even in the sun showing no gray hair (for a reason which Mrs. Hockin told me afterward), and he seemed to think it hard that a man with such a beard should be valued lightly.

"I do not see why we should talk," I said, "about either likes or dislikes. Only, if you have any thing to tell, I shall be very much obliged to you."

This gentleman looked at me in a way which I have often observed in England. A general idea there prevails that the free and enlightened natives of the West are in

front of those here in intelligence, and to some extent, therefore, in dishonesty. But there must be many cases where the two are not the same.

"No," I replied, while he was looking at his buttons, which had every British animal upon them; "I mean nothing more than the simple thing I say. If you ought to tell me any thing, tell it. I am accustomed to straightforward people. But they disappoint one by their never knowing any thing."

"But I know something," he answered, with a nod of grave, mysterious import; "and perhaps I will tell you some day, when admitted, if ever I have such an honor, to some little degree of friendship."

"Oh, please not to think of yourself," I exclaimed, in a manner which must have amused him. "In such a case, the last thing that you should do is that. Think only of what is right and honorable, and your duty toward a lady. Also your duty to the laws of your country. I am not at all sure that you ought not to be arrested. But perhaps it is nothing at all, after all; only something invented to provoke me."

"In that case, I can only drop the subject," he answered, with that stern gleam of the eyes which I had observed before, and detested. "I was also to tell you that we dine to-day an hour before the usual time, that my cousin may go out in the boat for whiting. The sea will be as smooth as glass. Perhaps you will come with us."

With these words, he lifted his hat and went off, leaving me in a most uncomfortable state, as he must have known if he had even tried to think. For I could not get the smallest idea what he meant; and, much as I tried to believe that he must be only pretending, for reasons of his own, to have something important to tell me, scarcely was it possible to be contented so. A thousand absurd imaginations began to torment me as to what he meant. He lived in London so much, for instance, that he had much quicker chance of knowing whatever there was to know; again, he was a man of the world, full of short, sharp sagacity, and able to penetrate what I could not; then, again, he kept a large account with Shovelin, Wayte, and Shovelin, as Major Hockin chanced to say; and I knew not that a banker's reserve is much deeper than his deposit; moreover—which, to my mind, was almost stronger proof than any thing—Sir Montague Hockin was of smuggling pedigree, and likely to be skillful in illicit runs of knowledge.

However, in spite of all this uneasiness, not another word would I say to him about it, waiting rather for him to begin again upon it. But, though I waited and waited, as, perhaps, with any other person I scarcely could have done, he would not condescend to give me even another look about it.

Disliking that gentleman more and more for his supercilious conduct and certainty of subduing me, I naturally turned again to my good host and hostess. But here there was very little help or support to be obtained at present. Major Hockin was laying the foundations of "The Bruntsea Assembly-Rooms, Literary Institute, Mutual Improvement Association, Lyceum, and Baths, from sixpence upward;" while Mrs. Hockin had a hatch of "White Sultans," or, rather, a prolonged sitting of eggs, fondly hoped to hatch at last, from having cost so much, like a chicken-hearted Conference. Much as I sorrowed at her disappointment—for the sitting cost twelve guineas—I could not feel quite guiltless of a petty and ignoble smile, when, after hoping against hope, upon the thirtieth day she placed her beautifully sound eggs in a large bowl of warm water, in which they floated as calmly as if their price was a penny a dozen. The poor lady tried to believe that they were spinning with vitality; but at last she allowed me to break one, and lo! it had been half boiled by the advertiser. "This is very sad," cried Mrs. Hockin; and the patient old hen, who was come in a basket of hay to see the end of it, echoed with a cluck that sentiment.

These things being so, I was left once more to follow my own guidance, which had seemed, in the main, to be my fortune ever since my father died. For one day Mr. Shovelin had appeared, to my great joy and comfort, as a guide and guardian; but, alas! for one day only. And, except for his good advice and kind paternal conduct to me, it seemed at present an unlucky thing that I had ever discovered him. Not only through deep sense of loss and real sorrow for him, but also because Major Hockin, however good and great and generous, took it unreasonably into his head that I threw him over, and threw myself (as with want of fine taste he expressed it) into the arms of the banker. This hurt me very much, and I felt that Major Hockin could never have spoken so hastily unless his hair had been originally red; and so it might be detected, even now, where it survived itself, though blanched where he brushed it into that pretentious ridge. Sometimes I liked that man, when his thoughts were large and liberal; but no sooner had he said a fine brave thing than he seemed to have an after-thought not to go too far with it; just as he had done about the poor robbed woman from the steerage and the young man who pulled out his guinea. I paid him for my board and lodging, upon a scale settled by Uncle Sam himself, at California prices; therefore I am under no obligation to conceal his foibles. But, take him altogether, he was good and brave and just, though unable, from absence of inner light, to be to me what Uncle Sam had been.

When I perceived that the Major condemned my simple behavior in London, and (if I may speak it, as I said it to myself) "blew hot and cold" in half a minute—hot when I thought of any good things to be done, and cold as soon as he became the man to do them—also, when I remembered what a chronic plague was now at Bruntsea, in the shape of Sir Montague, who went to and fro, but could never be trusted to be far off, I resolved to do what I had long been thinking of, and believed that my guardian, if he had lived another day, would have recommended. I resolved to go and see Lord Castlewood, my father's first cousin and friend in need.

When I asked my host and hostess what they thought of this, they both declared that it was the very thing they were at the point of advising, which, however, they had forborne from doing because I never took advice. At this, as being such a great exaggeration, I could not help smiling seriously; but I could not accept their sage opinion that, before I went to see my kinsman, I ought to write and ask his leave to do so. For that would have made it quite a rude thing to call, as I must still have done, if he should decline beforehand to receive me. Moreover, it would look as if I sought an invitation, while only wanting an interview. Therefore, being now full of money again, I hired the flyman who had made us taste the water, and taking train at Newport, and changing at two or three places as ordered, crossed many little streams, and came to a fair river, which proved to be the Thames itself, a few miles above Reading.

In spite of all the larger lessons of travel, adventure, and tribulation, my heart was throbbing with some rather small feelings, as for the first time I drew near to the home of my forefathers. I should have been sorry to find it ugly or mean, or lying in a hole, or even modern or insignificant; and when none of these charges could be brought against it, I was filled with highly discreditable pain that Providence had not seen fit to issue me into this world in the masculine form; in which case this fine property would, according to the rules of mankind, have been mine. However, I was very soon ashamed of such ideas, and sat down on a bank to dispel them with the free and fair view around me.

The builder of that house knew well both where to place and how to shape it, so as not to spoil the site. It stood near the brow of a bosoming hill, which sheltered it, both with wood and clevice, from the rigor and fury of the north and east; while in front the sloping foreground widened its soft lap of green. In bays and waves of rolling grass, promontoried, here and there, by jutting copse or massive tree, and jotted now and then with cattle as calm as boats at

anchor, the range of sunny upland fell to the reedy fringe and clustered silence of deep river meadows. Here the Thames, in pleasant bends of gentleness and courtesy, yet with will of its own ways, being now a plenteous river, spreads low music, and holds mirror to the woods and hills and fields, casting afar a broad still gleam, and on the banks presenting tremulous infinitude of flash.

Now these things touched me all the more because none of them belonged to me; and, after thus trying to enlarge my views, I got up with much better heart, and hurried on to have it over, whatever it might be. A girl brought up in the real English way would have spent her last shilling to drive up to the door in the fly at the station—a most sad machine—but I thought it no disgrace to go in a more becoming manner.

One scarcely ever acts up to the force of situation; and I went as quietly into that house as if it were Betsy Bowen's. If any body had been rude to me, or asked who I was, or a little thing of that sort, my spirit might have been up at once, and found, as usually happens then, good reason to go down afterward. But happily there was nothing of the kind. An elderly man, without any gaudy badges, opened the door very quietly, and begged my pardon, before I spoke, for asking me to speak softly. It was one of his lordship's very worst days, and when he was so, every sound seemed to reach him. I took the hint, and did not speak at all, but followed him over deep matting into a little room to which he showed me. And then I gave him a little note, written before I left Bruntsea, and asked him whether he thought that his master was well enough to attend to it.

He looked at me in a peculiar manner, for he had known my father well, having served from his youth in the family; but he only asked whether my message was important. I answered that it was, but that I would wait for another time rather than do any harm. But he said that, however ill his master was, nothing provoked him more than to find that any thing was neglected through it. And before I could speak again he was gone with my letter to Lord Castlewood.

CHAPTER XXXII.

AT HOME.

SOME of the miserable, and I might say strange, things which had befallen me from time to time unseasonably, now began to force their remembrance upon me. Such dark figures always seem to make the most of a nervous moment, when solid reason yields to fluttering fear and small misgivings. There any body seems to lie, as a stranded

sailor lies, at the foot of perpendicular cliffs of most inhuman humanity, with all the world frowning down over the crest, and no one to throw a rope down. Often and often had I felt this want of any one to help me, but the only way out of it seemed to be to do my best to help myself.

Even now I had little hope, having been so often dashed, and knowing that my father's cousin possessed no share of my father's strength. He might, at the utmost, give good advice, and help me with kind feeling; but if he wanted to do more, surely he might have tried ere now. But my thoughts about this were cut short by a message that he would be glad to see me, and I followed the servant to the library.

Here I found Lord Castlewood sitting in a high-backed chair, uncushioned and uncomfortable. When he saw me near him he got up and took my hand, and looked at me, and I was pleased to find his face well-meaning, brave, and generous. But even to rise from his chair was plainly no small effort to him, and he leaned upon a staff or crutch as he offered me a small white hand.

"Miss Castlewood," he said, with a very weak yet clear and silvery voice, "for many years I have longed in vain and sought in vain to hear of you. I have not escaped all self-reproach through my sense of want of energy; yet, such as I am, I have done my best, or I do my best to think so."

"I am sure you have," I replied, without thinking, knowing his kindness to my father, and feeling the shame of my own hot words to Mr. Shovelin about him. "I owe you more gratitude than I can tell, for your goodness to my dear father. I am not come now to trouble you, but because it was my duty."

While I was speaking he managed to lead me, feebly as himself could walk, to a deep chair for reading, or some such use, whereof I have had few chances. And in every step and word and gesture I recognized that foreign grace which true-born Britons are proud to despise on both sides of the Atlantic. And, being in the light, I watched him well, because I am not a foreigner.

In the clear summer light of the westering sun (which is better for accurate uses than the radiance of the morning) I saw a firm, calm face, which might in good health have been powerful—a face which might be called the moonlight image of my father's. I could not help turning away to cry, and suspicion fled forever.

"My dear young cousin," he said, as soon as I was fit to speak to, "your father trusted me, and so must you. You may think that I have forgotten you, or done very little to find you out. It was no indifference, no forgetfulness: I have not been able to work myself, and I have had very deep trouble of my own."

He leaned on his staff, and looked down at me, for I had sat down when thus overcome, and I knew that the forehead and eyes were those of a learned and intellectual man. How I knew this it is impossible to say, for I never had met with such a character as this, unless it were the Abbé of Fléchon, when I was only fourteen years old, and valued his great skill in spinning a top tenfold more than all his deep learning. Lord Castlewood had long, silky hair, falling in curls of silver gray upon either side of his beautiful forehead, and the gaze of his soft dark eyes was sad, gentle, yet penetrating. Weak health and almost constant pain had chastened his delicate features to an expression almost feminine, though firm thin lips and rigid lines showed masculine will and fortitude. And when he spoke of his own trouble (which, perhaps, he would not have done except for consolation's sake), I knew that he meant something even more grievous than bodily anguish.

"It is hard," he said, "that you, so young and healthy and full of high spirit as you are (unless your face belies you), should begin the best years of your life, as common opinion puts such things, in such a cloud of gloom and shame."

"There is no shame at all," I answered; "and if there is gloom, I am used to that; and so was my father for years and years. What is my trouble compared with his?"

"Your trouble is nothing when compared with his, so far as regards the mere weight of it; but he was a strong man to carry his load; you are a young and a sensitive woman. The burden may even be worse for you. Now tell me all about yourself, and what has brought you to me."

His voice was so quiet and soothing that I seemed to rest beneath it. He had not spoken once of religion or the will of God, nor plied me at all with those pious allusions, which even to the reverent mind are like illusions when so urged. Lord Castlewood had too deep a sense of the will of God to know what it is; and he looked at me wistfully as at one who might have worse experience of it.

Falling happily under his influence, as his clear, kind eyes met mine, I told him every thing I could think of about my father and myself, and all I wanted to do next, and how my heart and soul were set upon getting to the bottom of every thing. And while I spoke with spirit, or softness, or, I fear, sometimes with hate, I could not help seeing that he was surprised, but not wholly displeased, with my energy. And then, when all was exhausted, came the old question I had heard so often, and found so hard to answer—

"And what do you propose to do next, Erema?"

"To go to the very place itself," I said,

speaking strongly under challenge, though quite unresolved about such a thing before; "to live in the house where my father lived, and my mother and all of the family died; and from day to day to search every corner and fish up every bit of evidence, until I get hold of the true man at last, of the villain who did it—who did it, and left my father and all the rest of us to be condemned and die for it."

"Erema," replied my cousin, as he had told me now to call him, "you are too impetuous for such work, and it is wholly unfit for you. For such a task, persons of trained sagacity and keen observation are needed. And after all these eighteen years, or nearly nineteen now it must be, there can not be any thing to discover there."

"But if I like, may I go there, cousin, if only to satisfy my own mind? I am miserable now at Bruntsea, and Sir Montague Hockin wears me out."

"Sir Montague Hockin!" Lord Castlewood exclaimed; "why, you did not tell me that he was there. Wherever he is, you should not be."

"I forgot to speak of him. He does not live there, but is continually to and fro for bathing, or fishing, or rabbit-shooting, or any other pretext. And he makes the place very unpleasant to me, kind as the Major and Mrs. Hockin are, because I can never make him out at all."

"Do not try to do so," my cousin answered, looking at me earnestly; "be content to know nothing of him, my dear. If you can put up with a very dull house, and a host who is even duller, come here and live with me, as your father would have wished, and as I, your nearest relative, now ask and beg of you."

This was wonderfully kind, and for a moment I felt tempted. Lord Castlewood being an elderly man, and, as the head of our family, my natural protector, there could be nothing wrong, and there might be much that was good, in such an easy arrangement. But, on the other hand, it seemed to me that after this my work would languish. Living in comfort and prosperity under the roof of my forefathers, beyond any doubt I should begin to fall into habits of luxury, to take to the love of literature, which I knew to be latent within me, to lose the clear, strong, practical sense of the duty for which I, the last of seven, was spared, and in some measure, perhaps, by wanderings and by hardships, fitted. And then I thought of my host's weak health, continual pain (the signs of which were hardly repressed even while he was speaking), and probably also his secluded life. Was it fair to force him, by virtue of his inborn kindness and courtesy, to come out of his privileges and deal with me, who could not altogether be in any place a mere nobody? And so I refused his offer.

"I am very much obliged to you indeed," I said, "but I think you might be sorry for it. I will come and stop with you every now and then, when your health is better, and you ask me. But to live here altogether would not do; I should like it too well, and do nothing else."

"Perhaps you are right," he replied, with the air of one who cares little for any thing, which is to me the most melancholy thing, and worse than any distress almost; "you are very young, my dear, and years should be allowed to pass before you know what full-grown sorrow is. You have had enough, for your age, of it. You had better not live in this house; it is not a house for cheerfulness."

"Then if I must neither live here nor at Bruntsea," I asked, with sudden remonstrance, feeling as if every body desired to be quit of me or to worry me, "to what place in all the world am I to go, unless it is back to America? I will go at once to Shoxford, and take lodgings of my own."

"Perhaps you had better wait a little while," Lord Castlewood answered, gently, "although I would much rather have you at Shoxford than where you are at present. But please to remember, my good Erema, that you can not go to Shoxford all alone. I have a most faithful and trusty man—the one who opened the door to you. He has been here before his remembrance. He disdains me still as compared with your father. Will you have him to superintend you? I scarcely see how you can do any good, but if you do go, you must go openly, and as your father's daughter."

"I have no intention whatever of going in any other way, Lord Castlewood; but perhaps," I continued, "it would be as well to make as little stir as possible. Of an English village I know nothing but the little I have seen at Bruntsea, but there they make a very great fuss about any one who comes down with a man-servant."

"To be sure," replied my cousin, with a smile; "they would not be true Britons otherwise. Perhaps you would do better without Stixon; but of course you must not go alone. Could you by any means persuade your old nurse Betsy to go with you?"

"How good of you to think of it!—how wise you are!" I really could not help saying, as I gazed at his delicate and noble face. "I am sure that if Betsy can come, she will; though of course she must be compensated well for the waste all her lodgers will make of it. They are very wicked, and eat most dreadfully if she even takes one day's holiday. What do you think they even do? She has told me with tears in her eyes of it. They are all allowed a pat of butter, a penny roll, and two sardines for breakfast. No sooner do they know that her back is turned—"

"Erema!" cried my cousin, with some surprise; and being so recalled, I was ashamed. But I never could help taking interest in very little things indeed, until my own common-sense, or somebody else, came to tell me what a child I was. However, I do believe that Uncle Sam liked me all the better for this fault.

"My dear, I did not mean to blame you," Lord Castlewood said, most kindly; "it must be a great relief for you to look on at other people. But tell me—or rather, since you have told me almost every thing you know—let me, if only in one way I can help you, help you at least in that way."

Knowing that he must mean money, I declined, from no false pride, but a set resolve to work out my work, if possible, through my own resources. But I promised to apply to him at once if scarcity should again befall me, as had happened lately. And then I longed to ask him why he seemed to have so low an opinion of Sir Montague Hockin. That question, however, I feared to put, because it might not be a proper one, and also because my cousin had spoken in a very strange tone, as if of some private dislike or reserve on that subject. Moreover, it was too evident that I had tried his courtesy long enough. From time to time pale shades of bodily pain, and then hot flushes, had flitted across his face, like clouds on a windy summer evening. And more than once he had glanced at the time-piece, not to hurry me, but as if he dreaded its announcements. It was a beautiful clock, and struck with a silvery sound every quarter of an hour. And now, as I rose to say good-by, to catch my evening train, it struck a quarter to five, and my cousin stood up, with his weight upon his staff, and looked at me with an inexpressible depth of weary misery.

"I have only a few minutes left," he said, "during which I can say any thing. My time is divided into two sad parts: the time when I am capable of very little, and the time when I am capable of nothing; and the latter part is twice the length of the other. For sixteen hours of every day, far better had I be dead than living, so far as our own little insolence may judge. But I speak of it only to excuse bad manners, and perhaps I show worse by doing so. I shall not be able to see you again until to-morrow morning. Do not go; they will arrange all that. Send a note to Major Hockin by Stixon's boy. Stixon and Mrs. Price will see to your comfort, if those who are free from pain require any other comfort. Forgive me; I did not mean to be rude. Sometimes I can not help giving way."

Less enviable than the poorest slave, Lord Castlewood sank upon his hard stiff chair, and straightened his long narrow hands upon his knees, and set his thin lips in straight blue lines. Each hand was as rigid

as the ivory handle of an umbrella or walking-stick, and his lips were like clamped wire. This was his regular way of preparing for the onset of the night, so that no grimace, no cry, no moan, or other token of fierce agony should be wrung from him.

"My lord will catch it stiff to-night," said Mr. Stixon, who came as I rang, and then led me away to the drawing-room; "he always have it ten times worse after any talking or any thing to upset him like. And so, then, miss—excuse a humble servant—did I understand from him that you was the Captain's own daughter?"

"Yes; but surely your master wants you—he is in such dreadful pain. Do please to go to him, and do something."

"There is nothing to be done, miss," Stixon answered, with calm resignation; "he is bound to stay so for sixteen hours, and then he eases off again. But bless my heart, miss—excuse me in your presence—his lordship is thoroughly used to it. It is my certain knowledge that for seven years now he has never had seven minutes free from pain—seven minutes all of a heap, I mean. Some do say, miss, as the Lord doeth every thing according to His righteousness, that the reason is not very far to seek."

I asked him what he meant, though I ought, perhaps, to have put a stop to his loquacity; and he pretended not to hear, which made me ask him all the more.

"A better man never lived than my lord," he answered, with a little shock at my misprision; "but it has been said among censorious persons that nobody ever had no luck as came in suddenly to a property and a high state of life on the top of the heads of a family of seven."

"What a poor superstition!" I cried, though I was not quite sure of its being a wicked one. "But what is your master's malady, Stixon? Surely there might be something done to relieve his violent pain, even if there is no real cure for it?"

"No, miss, nothing can be done. The doctors have exorced themselves. They tried this, that, and the other, but nature only flew worse against them. 'Tis a thing as was never heard of till the Constitooshon was knocked on the head and to pieces by the Reform Bill. And though they couldn't cure it, they done what they could do, miss. They discovered a very good name for it—they christened it the 'New-rager!'"

CHAPTER XXXIII.

LORD CASTLEWOOD.

IN the morning, when I was called again to see my afflicted cousin—Stixon junior having gladly gone to explain things for me at Bruntsea—little as I knew of any

bodily pain (except hunger, or thirst, or weariness, and once in my life a headache), I stood before Lord Castlewood with a deference and humility such as I had never felt before toward any human being. Not only because he bore perpetual pain in the two degrees of night and day—the day being dark and the night jet-black—without a murmur or an evil word; not only because through the whole of this he had kept his mind clear and his love of knowledge bright; not even because he had managed, like Job, to love God through the whole of it. All these were good reasons for very great and very high respect of any man; and when there was no claim whatever on his part to any such feeling, it needs must come. But when I learned another thing, high respect at once became what might be called deep reverence. And this came to pass in a simple and, as any one must confess, quite inevitable way.

It was not to be supposed that I could sit the whole of my first evening in that house without a soul to speak to. So far as my dignity and sense of right permitted, I wore out Mr. Stixon, so far as he would go, not asking him any thing that the very worst-minded person could call "inquisitive," but allowing him to talk, as he seemed to like to do, while he waited upon me, and alternately lamented my hapless history and my hopeless want of taste.

"Ah, your father, the Captain, now, he would have knowed what this is! You've no right to his eyes, Miss Erma, without his tongue and palate. No more of this, miss! and done for you a-purpose! Well, cook will be put out, and no mistake! I better not let her see it go down, anyhow." And the worthy man tearfully put some dainty by, perhaps without any view to his own supper.

"Lord Castlewood spoke to me about a Mrs. Price—the housekeeper, is she not?" I asked at last, being so accustomed to like what I could get, that the number of dishes wearied me.

"Oh yes, miss," said Stixon, very shortly, as if that description exhausted Mrs. Price.

"If she is not too busy, I should like to see her as soon as these things are all taken away. I mean if she is not a stranger, and if she would like to see me."

"No new-comers here," Mr. Stixon replied; "we all works our way up regular, the same as my lad is beginning for to do. New-fangled ways is not accepted here. We puts the reforming spirits scrubbing of the steps till their knuckles is cracked and their knees like a bean. The old lord was the man for discipline—your grandfather, if you please, miss. He caught me when I were about that high—"

"Excuse me, Mr. Stixon; but would he have encouraged you to talk as you so very

kindly talk to me, instead of answering a question?"

I thought that poor Stixon would have been upset by this, and was angry with myself for saying it; but instead of being hurt, he only smiled and touched his forehead.

"Well, now, you did remind me uncommon of him then, miss. I could have heard the old lord speak almost, though he were always harsh and distant. And as I was going for to say, he caught me fifty years ago next Lammas-tide; a pear-tree of an early sort it was; you may see the very tree if you please to stand here, miss, though the pears is quite altered now, and scarcely fit to eat. Well, I was running off with my cap chock-full, miss—"

"Please to keep that story for another time," I said; "I shall be most happy to hear it then. But I have a particular wish, if you please, to see Mrs. Price before dark, unless there is any good reason why I should not."

"Oh no, Miss Erma, no reason at all. Only please to bear in mind, miss, that she is a coorous woman. She is that jealous, and I might say forward—"

"Then she is capable of speaking for herself."

"You are right, miss, there, and no mistake. She can speak for herself and for fifty others—words enough, I mean, for all of them. But I would not have her know for all the world that I said it."

"Then if you do not send her to me at once, the first thing I shall do will be to tell her."

"Oh no, miss, none of your family would do that; that never has been done anonymous."

I assured him that my threat was not in earnest, but of pure impatience. And having no motive but downright jealousy for keeping Mrs. Price from me, he made up his mind at last to let her come. But he told me to be careful what I said; I must not expect it to be at all like talking to himself, for instance.

The housekeeper came up at last, by dint of my persistence, and she stopped in the doorway and made me a courtesy, which put me out of countenance, for nobody ever does that in America, and scarcely any one in England now, except in country-dancing. Instead of being as described by Stixon, Mrs. Price was of a very quiet, sensible, and respectful kind. She was rather short, but looked rather tall, from her even walk and way of carrying her head. Her figure was neat, and her face clear-spoken, with straight pretty eyebrows, and calm bright eyes. I felt that I could tell her almost any thing, and she would think before she talked of it. And in my strong want of some woman to advise with—Betsy Bowen being very good but very narrow, and Mrs. Hockin a mere echo of the Major until he contradicted her,

and Susan Isco, with her fine, large views, five thousand miles out of sight just now—this was a state of things to enhance the value of any good countenance feminine.

At any rate, I was so glad to see her that, being still ungraduated in the steps of rank (though beginning to like a good footing there), I ran up and took her by both hands, and fetched her out of her grand courtesy and into a low chair. At this she was surprised, as one quick glance showed; and she thought me, perhaps, what is called in England "an impulsive creature." This put me again upon my dignity, for I never have been in any way like that, and I clearly perceived that she ought to understand a little more distinctly my character.

It is easy to begin with this intention, but very hard indeed to keep it up when any body of nice ways and looks is sitting with a proper deferential power of listening, and liking one's young ideas, which multiply and magnify themselves at each demand. So after some general talk about the weather, the country, the house, and so on, we came to the people of the house, or at any rate the chief person. And I asked her a few quiet questions about Lord Castlewood's health and habits, and any thing else she might like to tell me. For many things had seemed to me a little strange and out of the usual course, and on that account worthy to be spoken of without common curiosity. Mrs. Price told me that there were many things generally divulged and credited, which therefore lay in her power to communicate without any derogation from her office. Being pleased with these larger words (which I always have trouble in pronouncing), I asked her whether there was any thing else. And she answered yes, but unhappily of a nature to which it was scarcely desirable to allude in my presence. I told her that this was not satisfactory, and I might say quite the opposite; that having "alluded" to whatever it might be, she was bound to tell me all about it. That I had lived in very many countries, in all of which wrong things continually went on, of which I continually heard just in that sort of way and no more. Enough to make one uncomfortable, but not enough to keep one instructed and vigilant as to things that ought to be avoided. Upon this she yielded either to my arguments or to her own dislike of unreasonable silence, and gave me the following account of the misfortunes of Lord Castlewood:

Herbert William Castlewood was the third son of Dean Castlewood, a younger brother of my grandfather, and was born in the year 1806. He was older, therefore, than my father, but still (even before my father's birth, which provided a direct heir) there were many lives betwixt him and the family estates. And his father, having as yet no

promotion in the Church, found it hard to bring up his children. The eldest son got a commission in the army, and the second entered the navy, while Herbert was placed in a bank at Bristol—not at all the sort of life which he would have chosen. But being of a gentle, unselfish nature, as well as a weak constitution, he put up with his state in life, and did his best to give satisfaction.

This calm courage generally has its reward, and in the year 1842, not very long before the death of my grandfather at Shoxford, Mr. Herbert Castlewood, being well-connected, well-behaved, diligent, and pleasing, obtained a partnership in the firm, which was, perhaps, the foremost in the west of England. His two elder brothers happened then to be at home, Major and Commander Castlewood, each of whom had seen very hard service, and found it still harder slavery to make both ends meet, although bachelors. But, returning full of glory, they found one thing harder still, and that was to extract any cash from their father, the highly venerated Dean, who in that respect, if in no other, very closely resembled the head of the family. Therefore these brave men resolved to go and see their Bristol brother, to whom they were tenderly attached, and who now must have money enough and to spare. So they wrote to their brother to meet them on the platform, scarcely believing that they could be there in so short a time from London; for they never had travelled by rail before; and they set forth in wonderful spirits, and laughed at the strange, giddy rush of the travelling, and made bets with each other about punctual time (for trains kept much better time while new), and, as long as they could time it, they kept time to a second. But, sad to relate, they wanted no chronometers when they arrived at Bristol, both being killed at a blow, with their watches still going, and a smile on their faces. For the train had run into a wall of Bath stone, and several of the passengers were killed.

The sight of his two brothers carried out like this, after so many years of not seeing them, was too much for Mr. Herbert Castlewood's nerves, which always had been delicate. And he shivered all the more from reproach of conscience, having made up his mind not to lend them any money, as a practical banker was compelled to do. And from that very moment he began to feel great pain.

Mrs. Price assured me that the doctors all agreed that nothing but change of climate could restore Mr. Castlewood's tone and system, and being full of art (though so simple, as she said, which she could not entirely reconcile), he set off for Italy, and there he stopped, with the good leave of his partners, being now valued highly as heir to the Dean, who was known to have put a good trifle to-

gether. And in Italy my father must have found him, as related by Mr. Shovelin, and there received kindness and comfort in his trouble, if trouble so deep could be comforted.

Now I wondered and eagerly yearned to know whether my father, at such a time, and in such a state of loneliness, might not have been led to impart to his cousin and host and protector the dark mystery which lay at the bottom of his own conduct. Knowing how resolute and stern he was, and doubtless then embittered by the wreck of love and life, I thought it more probable that he had kept silence even toward so near a relative, especially as he had seen very little of his cousin Herbert till he had found him thus. Moreover, my grandfather and the Dean had spent little brotherly love on each other, having had a life-long feud about a copy-hold furze brake of nearly three-quarters of an acre, as Betsy remembered to have heard her master say.

To go on, however, with what Mrs. Price was saying. She knew scarcely any thing about my father, because she was too young at that time to be called into the counsels of the servants' hall, for she scarcely was thirty-five yet, as she declared, and she certainly did not look forty. But all about the present Lord Castlewood she knew better than any body else, perhaps, because she had been in the service of his wife, and, indeed, her chief attendant. Then, having spoken of her master's wife, Mrs. Price caught herself up, and thenceforth called her only his "lady."

Mr. Herbert Castlewood, who had minded his business for so many years, and kept himself aloof from ladies, spending all his leisure in good literature, at this time of life and in this state of health (for the shock he had received struck inward), fell into an accident tenfold worse—the fatal accident of love. And this malady raged the more powerfully with him on account of breaking out so late in life. In one of the picture-galleries at Florence, or some such place, Mrs. Price declared, he met with a lady who made all the pictures look cold and dull and dead to him. A lovely young creature she must have been (as even Mrs. Price, who detested her, acknowledged), and to the eyes of a learned but not keen man as good as lovely. My father was gone to look after me, and fetch me out of England, but even if he had been there, perhaps he scarcely could have stopped it; for this Mr. Castlewood, although so quiet, had the family fault of tenacity.

Mrs. Price, being a very steady person, with a limited income, and enough to do, was inclined to look down upon the state of mind in which Mr. Castlewood became involved. She was not there at the moment, of course, but suddenly sent for when all was settled; nevertheless, she found out aft-

erward how it began from her master's man, through what he had for dinner. And in the kitchen-garden at Castlewood no rampion would she allow while she lived. I asked her whether she had no pity, no sympathy, no fine feeling, and how she could have become Mrs. Price if she never had known such sentiments. But she said that they only called her "Mistress" on account of her authority, and she never had been drawn to the opposite sex, though many times asked in marriage. And what she had seen of matrimony led her far away from it. I was sorry to hear her say this, and felt damped, till I thought that the world was not all alike.

Then she told me, just as if it were no more than a bargain for a pound of tallow candles, how Mr. Herbert Castlewood, patient and persistent, was kept off and on for at least two years by the mother of his sweet idol. How the old lady held a balance in her mind as to the likelihood of his succession, trying, through English friends, to find the value and the course of property. Of what nation she was, Mrs. Price could not say, and only knew that it must be a bad one. She called herself the Countess of Ixorism, as truly pronounced in English; and she really was of good family too, so far as any foreigner can be. And her daughter's name was Flittamore, not according to the right spelling, perhaps, but pronounced with the proper accent.

Flittamore herself did not seem to care, according to what Mrs. Price had been told, but left herself wholly in her mother's hands, being sure of her beauty still growing upon her, and desiring to have it admired and praised. And the number of foreigners she always had about her sometimes made her real lover nearly give her up. But, alas! he was not quite wise enough for this, with all that he had read and learned and seen. Therefore, when it was reported from Spain that my father had been killed by bandits—the truth being that he was then in Greece—the Countess at last consented to the marriage of her daughter with Herbert Castlewood, and even seemed to press it forward for some reasons of her own. And the happy couple set forth upon their travels, and Mrs. Price was sent abroad to wait upon the lady.

For a few months they seemed to get on very well, Flittamore showing much affection for her husband, whose age was a trifle more than her own doubled, while he was entirely wrapped up in her, and labored that the graces of her mind might be worthy to compare with those more visible. But her spiritual face and most sweet poetic eyes were vivid with bodily brilliance alone. She had neither mind enough to learn, nor heart enough to pretend to learn.

It is out of my power to describe such things, even if it were my duty to do so, which, happily, it has never been; moreover, Mrs. Price, in what she told me, exercised a just and strict reserve. Enough that Mr. Castlewood's wedded life was done with in six months and three days. Lady Castlewood, as she would be called, though my father still was living and his cousin disclaimed the title—away she ran from some dull German place, after a very stiff lesson in poetry, and with her ran off a young Englishman, the present Sir Montague Hockin. He was Mr. Hockin then, and had not a half-penny of his own; but Flittamore met that difficulty by robbing her husband to his last farthing.

This had happened about twelve years back, soon after I was placed at the school in Languedoc, to which I was taken so early in life that I almost forget all about it. But it might have been better for poor Flittamore if she had been brought up at a steady place like that, with sisters and ladies of retreat, to teach her the proper description of her duties to mankind. I seemed now in my own mind to condemn her quite enough, feeling how superior her husband must have been; but Mrs. Price went even further, and became quite indignant that any one should pity her.

"A hussy! a hussy! a poppet of a hussy!" she exclaimed, with greater power than her quiet face could indicate; "never would I look at her. Speak never so, Miss Castlewood. My lord is the very best of all men, and she has made him what he is. The pity she deserves is to be trodden under foot, as I saw them do in Naples."

After all the passion I had seen among rough people, I scarcely could help trembling at the depth of wrath dissembled and firmly controlled in calm clear eyes under very steadfast eyebrows. It was plain that Lord Castlewood had, at any rate, the gift of being loved by his dependents.

"I hope that he took it aright!" I cried, catching some of her indignation; "I hope that he cast her to the winds, without even a sigh for such a cruel creature!"

"He was not strong enough," she answered, sadly; "his bodily health was not equal to it. From childhood he had been partly crippled and spoiled in his nerves by an accident. And the shock of that sight at Bristol flew to his weakness, and was too much for him. And now this third and worst disaster, coming upon him where his best hope lay, and at such a time of life, took him altogether off his legs. And off his head too, I might almost say, miss; for, instead of blaming her, he put the fault entirely upon himself. At his time of life, and in such poor health, he should not have married a bright young girl: how could he ever

hope to make her happy? That was how he looked at it, when he should have sent constables after her."

"And what became of her—the mindless animal, to forsake so good and great a man? I do hope she was punished, and that vile man too."

"She was, Miss Castlewood; but he was not; at least he has not received justice yet. But he will, he will, he will, miss. The treacherous thief! And my lord received him as a young fellow-countryman under a cloud, and lent him money, and saved him from starving; for he had broken with his father and was running from his creditors."

"Tell me no more," I said; "not another word. It is my fate to meet that—well, that gentleman—almost every day. And he, and he—oh, how thankful I am to have found out all this about him!"

The above will show why, when I met my father's cousin on the following morning—with his grand, calm face, as benevolent as if he had passed a night of luxurious rest instead of sleepless agony—I knew myself to be of a lower order in mind and soul and heart than his; a small, narrow, passionate girl, in the presence of a large, broad-sighted, and compassionate man.

I threw myself altogether on his will; for, when I trust, I trust wholly. And, under his advice, I did not return with any rash haste to Bruntsea, but wrote in discharge of all duty there; while Mrs. Price, a clear and steadfast woman, was sent to London to see Wilhelmina Strouss. These two must have had very great talks together, and, both being zealous and faithful, they came to many misunderstandings. However, on the whole, they became very honest friends, and sworn allies at last, discovering more, the more they talked, people against whom they felt a common and just enmity.

LA FESTA DELLO STATUTO.

THE sunset heavens are all aglow,
Trumpets are blown and roses blow,
And gales of fragrance and melody flow
Round aloes and palms of the Pincian,
Where a brilliant Corso seems to grow
In endless procession, rolling slow
Through the populous garden, to and fro,
Over against the Vatican,
Whose vast white silence thunders No,
And smites, a self-imprisoned woe,
In the face of the Romans' holiday show.

Beyond, on the ridge Janiculan,
Umbrella pines in funereal row
Frown darkly, and infinite shadows throw
On the level light. Like a halo of snow,
In tinge the mid-ribbon of a rainbow,
Above yon dome metropolitan

A cloud-ring floats; in the nave below
A worshiper, licking the floor, doth go
On his knees to kiss bronze Peter's toe—
Religion groveling in dust, as though
An Ariel sunk to a Caliban!

Ere evening glides into the gloam,
Through the Villa Medici's sombre bloom
To the crest of the Mountain of Gardens clomb,
Lo! the whole circuit Aurelian!

How martyrs' dust from the catacomb
Blossoms in many a swelling dome,
More richly gilt by the sunset's chrome—
High altar, perchance, an Apostle's tomb,
The outside steps a beggar's home—

Far as the desolate Cœlian,
And the statues tossed in air like foam
From the roof of the lordly Lateran!

The gods are dethroned in the Pantheon;
But ruinous walls, like the crumbling loom
Of a once world-shaking thunder-boom,
Crop, here and there, out of Cæsar's Rome,
And the grandeur that was Republican.

From Flaminian gate to the Aventine,
From the Borgo to the Quirinal,
In Campus Martius, on Esquiline,
And the Trastevere—bell and shrine—

Towers the Rome Pontifical;
With the Bambino, a doll benign,
Miraculous cure in its jewel shine,
On the seat of Jove Capitoline.

But Rome still rules Imperial
In the region of the Palatine.
But a boulevard lords it, lofty and fine
In insolence of youth, on the Viminal.

Musing, I watch the sun decline,
Revealing a golden thread of brine
Beyond the Campagna's sea-like line,
Till in that Hesperian burial
The day with its thoughts has gone to join
The ages dead and the ghosts divine

Of the men of the Forum and Capitol.
But, land of brotherly palm and pine!
Land of the olive and the vine!
Land of Latin and Sabine!

A future of glowing hope is thine;
For a Star in the East ethereal,
The Star of Liberty, thine and mine,
Pours light in a joyous flood, like wine,
To the weary watchers for a sign—
New-risen o'er snowy Apennine
On the Rome of Victor Emanuel.

'Tis night, but the city is noisy and gay
With crowds on crowds that mingle and flow—
An under-sweep of majestic sway
From the past, heard near and far away,
The voices of yore and of yesterday—
To the Tiber; and, lo! the girondola,
In fiery fantasies of display,
On the Castle of Saint Angelo!

THE WHEELER SURVEY IN NEVADA.

THE seal of Nevada is a fair epitome of the geographical resources of that State. The plow and the scythe by the sheaf of wheat in the foreground are abandoned apparently, but the reduction mills in the right of the picture, the mine in the left, and the little man in silhouette, who is

propelling a car-load of ore along the trestle-work, are in full operation. The mountains in the rear, behind which the sun is taking himself in splendid flashes, are sharply serrated, and, what is most characteristic, no silvery reach of river, nor mirror of lake, nor oasis of verdure, is to be seen. There are rivers and lakes in the State, to be sure, but they seem to be tentative on nature's part, and not one of them finds an outlet to sea, nor contributes a drop to any other stream hurrying to that great reservoir. The soil puts desolation in a stronger light. It dries up all the water it receives; two large rivers disappear in it, and still it is fallow, irresponsive, and discouraging.

THE CASCADE NEAR EMERALD
BAY.

The overland train from the East leaves Ogden at sunset, when the cordon of mountains is flushed with the waning palpitations of fiery light, when all the farms of the Salt Lake Valley are looking their best, and when the orchards, corn fields, and pastures are sweet with content. The Mormons may have a very gloomy side to their history, but their severest critic must allow that their industrial progress has been wonderful, that they have done more with less at their command than most other colonists in the West, and that their Territory superficially is nothing but a credit to them.

On the next morning we have crossed the boundary of Utah, and are in Nevada, and leaves, grass, and the pungent scent of alluvial earth are unsubstantial memories to us. There is space and no atmosphere, soil and no verdure, mountains and no inspiration; the sky has no fleck in its glassy blue; the crusted land crumbles to dust under the

life and beneficent mother, and this is fruitless, oppressive, and wholly unattractive. But it is of just such a soil, environed by just such mountains, that the greater part of Nevada is formed; and the inhabitants, with a frankness of nomenclature that is none too common among far Western people, recognize the sterility of their country, and call it "the Desert State."

The most wearisome day of the seven which the overland journey takes is spent in traversing the breadth of the State; and except at Humboldt, a little station midway in the desert, where irrigation has forced a patch of green, the pines of the Sierras are the first signs of fertility met with. Even the eastern slopes of the Sierras, of which the pines are as much a part in the popular idea as the spray is a part of the sea, are wofully barren, and for thirty miles south of the Central Pacific Railway the salient features of the country are maroon-colored

A STREET CORNER IN CARSON.

feet, and nourishes no heartier growth than the sickly artemisia; the mountains are hot and bare. What blight, or drought, or unfinished process of nature has left such a blot as this on the earth? It hardly seems to be the earth at all, for the earth is a pro-

mountains, with weird abutments of detritus, yellow plains, and occasional erosions of rock, which divert us by the mad fancifulness of their design.

Carson, the capital of the State, is called after the celebrated path-finder, who first

crossed the Sierras in 1833, and again in 1846 with the pertinacious General J. C. Fremont. It is a busy little city of about four thousand inhabitants, with several large brick and stone buildings, including the Capitol and the United States Mint; the streets are bordered with willows and aspens, and the houses are pretty and home-like. In fact, Carson individualizes itself among the smaller cities of the Pacific coast in the impressions of a stranger by its many home-like qualities. It bends now and then into a suspicious "corner," but the evil-appearing saloon is an almost unavoidable adjunct of all new Western settlements. A frequent trade-mark of the merchants is the big grizzly of the Pioneer Society, and the claims of various advertisers are emphasized by the fact that they are pioneers.

No insignia of star, cross, or garter that royalty can confer upon its favorites is more potent abroad, by-the-way, than the badge and patent of the Pioneer Society are in Nevada and in California. To have shared the vicissitudes of the early adventurers, who, by wagon train across the plains and emigrant ship around Cape Horn, came to the country at the beck of the first gold excitement, to be able to pin upon one's breast the little silver "grizzly" with which the society distinguishes its members, is a privilege that elevates its possessors to a peerage, and secures exemption for them from the tests that measure the conduct of other men. An appalling number of thriftless ne'er-do-wells, chronically threadbare and blandly impudent, claim consideration on no ground but that self-interest brought them to Nevada fifteen or twenty years before the mass of the population had arrived; and though the people are guarded enough against imposition in most instances, to say of any plausible old humbug, "He is a pioneer," is a plea for charity, if charity is needed, and sufficient condonement for a multitude of sins in the opinion of later and altogether worthier settlers. Do not misunderstand us as belittling the Pioneer Society. Mr. Sam Baker, of Carson, has a book containing the names of members and their adventures, from which many incidents of courage, perseverance, muscle, and brain might be extracted. It is undeniable that the Pacific coast owes much to some of its Argonauts, but the loudest claimants for the honor are an undeserving lot, whose coming must have been a misfortune at any time.

The outfitting camp of the geographical surveys west of the one-hundredth meridian, in charge of Lieutenant George M. Wheeler, was located in Carson last year, and thence four parties entered the field, one to measure and develop a base-line near Sutro, another to triangulate the desert as far eastward as Austin, and the others to occupy important peaks in the Sierra Nevada. The writer

was detailed for service with one of the latter, and proposes to embody his experiences in this article.

The methods of Lieutenant Wheeler's work are in themselves worthy of attention, and of course they are very different from those of the ordinary land surveyor; for, while the latter has an inch to delineate, the former, who is not local but geographical, has a hundred square yards. The level, chain, and tally pins are left at home, and the basis of the work is the transit, or theodolite, with a compass attachment; instead of the level, the cistern barometer is used in ascertaining elevations, and instead of the chain or stadia, the odometer wheel is the means of mensuration.

The odometer proper is a dial attached to the wheel, the revolutions of which it records, and as a certain number of revolutions make a mile—exactly how many is found by running the wheel over a chain-measured mile—a little sum in division is all that is necessary to show the distance travelled from day to day.

A picture of an odometer accompanies this article, but the drawing gives no idea of the strange feats of which the machine is capable. To see the odometer on a steep mountain trail is better fun than a circus; as it wobbles along a good road, it excites the curiosity and conjectures of the natives, to whom the one wheel without a body is the acme of ludicrous uselessness; but on a precipitous path, strewn with enormous boulders and netted with chaparral, it shows the infinite possibilities of its motions. At one moment it bounds from the ground and saws the air; then it swings over the rider's head, and assumes the appearance of a patent hair-brushing machine of unusual proportions; and in extreme instances it reverses its normal motions entirely, and is propelled by the mule instead of dragging at that capricious creature's pendulatory tail.

The theodolite, the odometer, and the barometer are the three instruments indispensable to the work of a field party, and to carry and operate them three men are employed—a topographer, an odometer recorder, and a meteorologist. Observations in geology, mineralogy, zoology, and ethnology are secondary to these, but they are necessary to complete the diagnosis of the country to be delineated, and a specialist in at least one of the branches is attached to each field party. The organization of the party with which the writer travelled last season is representative. It consisted of Lieutenant M. M. Macomb, executive officer and astronomer; Frank Carpenter, topographer, to whom I am indebted for the material of some of these notes; H. W. Henshaw, zoologist; Alfred Du Bois, meteorologist; a geological assistant, an odometer recorder, two packers, and a cook. When the terri-

tory to be traversed is occupied by hostile Indians, an escort of soldiers may be added; and in a country where the settlements are few, and the points at which the supplies can be renewed are far between, the customary allowance of a pack mule and a riding mule to each member may be increased. In New Mexico, for example, it was often necessary

is near a town connected by telegraph with a national observatory, and a series of exchanges with that observatory, in addition to an independent series for latitude, extending through two weeks, is enough to determine the geographical co-ordinates of the point of departure. The observations for latitude are continued at nearly every camp, and when the other members of the party are chatting around the camp fire, the astronomer retires to a dark, quiet spot with his instrument, and lying on his back, or resting his elbow on the rough ground, occupies himself with the stars, which never seem so cold, so far, nor so brilliant else-

THE ODOMETER CARRIAGE.

to carry thirty days' rations, while in California fresh supplies might have been obtained daily; and differences of this kind materially alter the equipment. The complete outfit—rations, bedding, clothing, and instruments—is packed upon mules, and the camp may thus be taken much nearer to the peak which is to be ascended or to the cañon which is to be meandered than a wagon could possibly go. The number of parties depends upon the amount of money granted by Congress. In 1876 six parties were put into the field by Lieutenant Wheeler on an appropriation of thirty thousand dollars, a considerable part of which sum was devoted to office expenses, which include the salaries of draughtsmen and clerks, and the cost of publications.

The survey has a trigonometrical basis, and its initial point in the area to be surveyed is in the centre of a broad valley, or an intermontane plateau, whose level expanse offers fair ground for the measurement and development of the base-line, which becomes a metrical standard for finding the length of all the triangles extended. With the base-line as a starting-point, four classes of stations are occupied, of which in importance the astronomical is first, the primary triangulation station second, the topographical station third, and the route or meander station fourth. Usually the outfitting camp

where as they do from a peak in the Rocky Mountains or in the Sierra Nevada. He is assisted by an observer for time, who, with an open watch and a lantern before him, records the hour, minutes, and seconds in response to the word "tick," which the astronomer utters at each observation. These two men, isolated and scarcely revealed by the flash of the fire and the yellow gleam of their own lanterns, make a picture, and when the night is frosty, the picture is one of misery.

The triangulation station is established on a mountain, which may be in the belt of perpetual snow, and its occupation lasts during one or two days, according to the condition of the weather. One night is spent on the crest to determine the azimuth of a radiating line, and the topographer makes a contour sketch of the area at his feet. These things completed, the direction of the projecting spurs is discovered, and single readings are taken with the theodolite to subordinate geographical features. In the office a contour sketch is accepted as evidence of the country as it really is, and the profile drawing, which is also made by the topographer, is taken as a representation of what the country appears to be. The angles which lie between the visible points of the triangulation scheme are read and repeated singly and in combinations, the

time chosen usually being in the evening, or in the early morning when the sun is behind the hills, and the rim of the earth is seen in silhouette against the rosy background of the sky.

The topographical station is occupied to secure local topography, and from it angles are read to three or more known points.

some instances—as in productive mining districts—one mile of ground is allotted two inches of space on the map.

Similar surveys exist in nearly all European countries. In Great Britain the counterpart is the Ordnance Survey, which employs nineteen officers and three hundred and sixty-four men of the Royal Engineers.

WHEELER'S EXPLORING PARTY IN THE MOUNTAINS OF NEVADA.

Then by lines of sight, which are intersected by other lines of sight from other topographical stations, the most prominent features within a radius of twenty or thirty miles are located. The meander stations are used in tracing the roads, trails, water-courses, and cañons, determining the distances between springs, villages, and pastures, and obtaining such other information as may help future travellers.

This is a mere outline of the methods used by Lieutenant Wheeler in constructing a map; a fuller and more technical treatise would show how the triangles interlock and form a mesh which grasps all the topographical features of the country, allowing neither river, trail, nor spring to pass unnoticed.

An arbitrary scale of one inch to the mile was at first suggested for the resultant maps. But experience has shown that while one inch of space is enough to represent level and vacant plains, in other regions four inches are not too many; and in

one thousand civil assistants, and four hundred and forty-eight laborers. The scale of the maps is six inches to the mile, and over twenty million dollars in gold have been expended on the work. Austria expends annually about four hundred and ninety thousand dollars for surveys, which employ one thousand two hundred and fifty-eight persons, including two hundred and eighty-three army officers. In Russia a military topographical corps have charge of the surveys, employing six generals, thirty-three majors, lieutenant-colonels, and colonels; one hundred and fifty cornets, lieutenants, and captains; four hundred topographers, and forty-two apprentices. In Spain, Italy, Switzerland, Sweden, and Prussia, also, the surveys are directed by military officers; and in the Franco-Prussian war, General Von Moltke made a point of arming each of his field-officers with a copy of the most accurate map obtainable of the country to be occupied, thus, doubtless, avoiding many mistakes and disasters.

While the eastern incline of the Sierras and the vast plains sweeping from it are destitute of nearly every interesting geographical feature, the western slope, reaching down from above the Nevada boundary line into the lap of California, is among the most beautiful places in all the West. The route of our first day's march lay through one of the ravines in the mountains behind Carson, and over a zigzag road to the summit of the divide. The edge of the road was the edge of a precipice, which descended into the valley and swept upward into shelving cliffs. The sturdy pines shot out of the slope as straight and inflexible as rods of iron, and sickened the air with the pungency of their balsam; springs without number burst out of the rocks and clattered down in veins of white and silver; thickets of oaks and willows contrasted their paler emerald with the dark shade of the evergreens, and in greater contrast still was a bright golden-green moss, which grew in belts and streaks on the ruddy brown bark of the pines.

At noon we reached the summit of the divide; and there before us, shining as though it had drained the snowy mountains and the dusky foot-hills encircling it of all the silver their veins contained, was the broad surface of Lake Tahoe, the triangulation of which was to occupy us for the next two months. The maroon-colored desert was now behind us, and before us was a region surpassing in many elements the

pleasant fancy that he has seen Tahoe. But we, who were encamped upon the shore during the mellow closing of a summer, the hazy, subtle days of an autumn, and the beginning of a white winter, know that not in one day, nor in a week, nor in a season, can all the beauties of this crystalline expanse be explored. Snow brings one aspect with it when it spreads a veil of lace over the massive peaks; snow and mist together spiritualize the highest and heaviest ridges, and make them seem as mere shadows in the clouds; the ardent warmth of an evening works its own transformations; and even a wet day has a charm, and lends an expressiveness of its own to the landscape. But when it has been seen under all these conditions, Tahoe has endless other attractions to reveal. It is fickle in its moods, but constant in its loveliness, and the nearer it is approached, the lovelier it is.

It was from one of the surrounding mountains that the lake was discovered; and according to a popular legend, the Washoe Indians, who were the discoverers, exclaimed on seeing it, "Tahoe!" which is their word for ocean or "big water." For some time it was called Lake Bigler, after a California politician, and when he had disgraced himself, the name was changed to the sweeter Indian word by which it is now known. It is about twenty-two miles long and ten miles wide, and it has been sounded to a depth of 1600 feet. The water is marvelously clear and cold, and, where the slant

LAKE TAHOE.

famous Rocky Mountains. A rapid descent through a verdurous cañon, whose walls were speared with a close array of stalwart pines, led us to the banks of the lake, and our first camp was made at Glenbrook, an orderly little settlement, where most of the saw-milling is done.

A small steamboat circumnavigates the lake from Glenbrook, and the tourist who makes the trip deludes himself with the

of the shore is acute, the great yellow boulders lying at the bottom are plainly visible in a depth of forty or fifty feet. Its color is not the living ultramarine of the sea, but an absolute turquoise, a pale opaque blue, changing in the shallows to a bright olive.

It is a paradise for trout, which attain an uncommon size without losing any of their supreme delicacy of flavor. Our naturalist was eager for a twenty-eight pound speci-

men, such as we had heard of, but an eight-pounder was the best he ever caught. At Lake Valley, the southern end of Tahoe, the country is marshy, and we obtained from it teal, mallard, and canvas-back duck, wild turkeys, geese, and bittern, the latter being by no means bad eating. The hills afforded us grouse and quail, and we were told that deer had been abundant earlier in the season.

Tahoe is the largest of a dozen or more

land is half swamp and half chaparral, except near the borders of the lakes, where it is densely wooded. The little steamboat that makes the round of Lake Tahoe calls daily at Tallac Landing in the summer, and a carriage road leads thence to Gillmore's Soda Springs, which are at the foot of the peak.

About eight miles from Tallac Landing, in the western or California shore of the

THE PEBBLY BEACH AND ROCKS AT ZEPHYR COVE, LAKE TAHOE.

lakes which cluster within a radius of twenty miles, at a height of from five to seven thousand feet above the level of the Pacific, those nearest to it being Echo, Marlette, Fallen Leaf, and Cascade. Marlette, or Silver Lake, is the source of the water supply of Virginia City, and is about a mile in circumference. A strip of marsh reaches across the northwestern end, and the ripples break in on a fringe of spongy turf.

Fallen Leaf is the most beautiful of all the smaller lakes, and is separated from Tahoe by a belt of land not more than three miles wide. It is at the foot of Tallac Peak, which emphasizes itself among others in the chain by a cross of perpetual snow and by the boldness of its profile. The peak is basaltic, and its predominant color is a rich sage green; but besides the sage green and the various greens of the foliage, the lichens have given it purples, yellows, and crimsons in profusion.

The mountain descends abruptly from its cap of perpetual snow to the lake, which is about seven miles in circumference, and 120 feet higher than Tahoe. The intervening

lake, a deep indenture, called Emerald Bay, occurs, which rivals Fallen Leaf Lake in its many beauties. The mountains descend sharply into its deep water; the vegetation is abundant; and from an immense cliff nearly a thousand feet above the level a cascade pours itself in white wrath. The source of the cascade is in another lake behind the mountains and in a basin fed by the melting of eternal snows and wooded by the stoic pines.

We remained in the neighborhood of Tahoe until winter drove us out, and then we returned to the silver-bearing region of the eastern slope, which is more characteristic of Nevada than the valleys of the Sierras.

The discovery of gold in Nevada, then Western Utah, and subsequently Washoe, was made by some Mormon immigrants in 1850. They were on their way to California, and on reaching the Carson River found the crossing of the Sierras impracticable, owing to snows. During the winter that followed they obtained small quantities of gold from the gravel of neighboring streams, but not enough to induce them to remain,

and when spring set in they completed their journey. There are always plenty of men in California who are willing to rush hither and thither at the beck of any new mining excitement, and as soon as the Mormon discovery became known, a parcel of adventurers crossed the Sierras, and set up their sluice-boxes in the cañons around what is now Virginia. It was gold that they were after, and they neither suspected the existence of silver nor knew it when they saw it. The bluish stuff which was so abundant, and which was silver ore, interfered with their operations, and they cursed it from morning till night. As they worked nearer and nearer to the lode, a lighter metal took the place of gold, and mystified them more than ever.

Among them, however, were two brothers, named Groesch, who were exceptions to the general obfuscation. They were young men of intelligence and education, who, in addition to their mining tools, possessed some books on mineralogy and metallurgy and some apparatus for assaying. It was understood that they had made "a big strike," and it is probable that they were the real discoverers of the Comstock lode; but one of them died from a pickaxe wound in the foot, and the other was frozen to death in the mountains. Their secret, if they had one, died with them.

A Mexican also had some knowledge of a deep argentiferous deposit, and endeavored to impart the information to others, exclaiming, as he pointed toward Mount Davidson, "Mucho plata! mucho plata!" which the Americans very freely translated as meaning, "Lots of money; gold somewhere in the mountains."

When at last, in the early part of 1859, the surface croppings of the lode were found, it was by a stupid accident; they were worked for the gold that they contained, and the silver was thrown out as being worthless. The first locators were Peter O'Riley and Patrick M'Laughlin, who staked a claim on the present site of the Ophir Mine; but before they could secure it, Henry Comstock, a character familiar in the neighborhood as "Old Pancake," made his appearance, and demanded a share for the reason that he owned the water privileges. This was the bit of brass that won an interest in the silver for Comstock, and by other effrontery of a similar kind he succeeded in attaching his name to the lode, which, as it became known, attracted thousands of miners to it, and has, since 1860, yielded more than one-tenth of all the silver produced throughout the world.

The genesis of the lode has been the subject of extensive geological disquisitions. Mount Davidson, the peak of the Sierra Nevada through which the vein runs, is an uplift of syenite 7827 feet above the level of the Pacific. Millions of years ago it proba-

bly stood out as an isolated cone in a prehistoric sea; then, as the waters subsided, it stood alone on the vast plains which had formed the bottom of the sea. Thousands of years later a volcanic eruption surrounded it with the multitude of other peaks formed of greenstone or propylite, which bristle about it like the spines of a cactus, and among which it looms pre-eminent; a second convulsion split the propylite country, and brought up a range of trachytic mountains. The trachyte was in a semi-fluid state, and so great was the pressure from beneath that the whole of the greenstone was uplifted, causing the formation of a fissure along the line of its contact with the syenite. This fissure, which was held open by the wedges of propylite that fell into it, was filled in the course of years, possibly by volatilization, with the gold and silver which now yield such magnificent profits on the investments of the Bonanza mines.

The mountains that hedge Mount Davidson in are packed together as I have seldom seen mountains packed elsewhere, and give evidence of volcanic action of an extent and of an intensity almost unparalleled. The basins are sterile and matted with the sickly-looking artemisia or sage-brush, and wherever a pine or a fir has once existed, a stump is all that remains to commemorate the fact. Four miles eastward the Carson River makes a trail of arborescent verdure through one of these desolate valleys, and that faint line of green is like a glimpse of paradise to us as we emerge from one of the rugged cañons which lie between the chaotic-looking peaks and streak them with blue furrows.

Following the discovery of O'Riley and M'Laughlin, a town named after "Old Virginia," one of the pioneers, appeared on the eastern slope of the mountain, a little above the surface outcroppings of the lode. The settlement began with a few tents and log-cabins. In 1860 it had developed an International Hotel and a newspaper office. The hotel contained a bar-room, a dining-room, and about a dozen sleeping-rooms, and the charges were at the rate of seven or eight dollars a day. The newspaper establishment consisted of a shed and one room; the shed was occupied as a cooking, dining, and sleeping place by editors, reporters, and compositors, and the room answered the purposes of an editorial, typographical, and advertising department combined. Laws were necessary to control the many lawless adventurers who flocked into the city, and a code was adopted: it was brief, practical, and unincumbered with legal verbiage. Any municipality which finds its own voluminous statutes inadequate might try it to advantage. There was no prison, and the two punishments prescribed for all offenses were hanging and banishment.

Virginia City now has a population of about twenty-five thousand, including one-half the whole number of voters in the State of Nevada. Few pictures of it give a correct idea of its position. In photographs it appears to be at the foot of the mountain, while it is in fact built across the mountain's face, and the peak that rises two thou-

and within six months the whole city had been rebuilt.

To guard against a recurrence of the disaster, a system of reservoirs and hydrants was established, and it would be easier now to flood the city than to burn it. The Virginians are proud of the quality and abundance of their water supply. The works

CAVE ROCK, LAKE TAHOE.

sand feet above it also extends two thousand feet below it. It is so environed and confined by mountains that the railway which connects it with the Central Pacific at Reno has curves enough to describe a circle of three hundred and sixty degrees seventeen times; the distance to Reno in a bee-line is sixteen miles, and the distance by the railway, which cost two million dollars, is fifty-two miles.

The pitch of the ground is such that what is the first story of a house in front becomes the second or third story in the rear, and looking eastward, northward, or southward, the eye meets an unvaried prospect of chain after chain of interlocked peaks.

The people are ultra-Californian in their nature and habits, excessively fond of display, lavishly hospitable, impetuous in business, and irrepressible in speculativeness. On October 26, 1875, a fire swept the city from end to end, and ten million dollars' worth of property, including all the mining works on the surface, went up in the flames. Within sixty days the most important mines had renewed their buildings and machinery,

cost over two million dollars, and the water is brought a distance of thirty-one and a half miles from Marlette's Lake, in the Sierras.

What is most surprising to the stranger is the proportions of the constant rushing crowd on C Street, the principal thoroughfare, and the cosmopolitan character of its elements. Piute and Washoe Indians in picturesque rags, Chinamen in blue and black blouses, brawny Cornishmen, vehement Mexicans, and many other people from far-apart countries mingle and surge along in the stream. There is nothing provincial or shabby. The stores are well stocked, and the show-windows glitter with the attractiveness of their wares. The men around you are men of the world, who have travelled, and in many instances made money.

The restaurants are not the least among the marvels of Virginia City. While every thing else is frightfully dear, and the storekeepers seem to consider all purchasers the happy possessors of a Fortunatus purse, food is uncommonly cheap, and an excellent dinner of four courses can be had for fifty cents,

LONGITUDINAL SECTION OF COMSTOCK LODE AND THE PRINCIPAL MINES.

or a more elaborate dinner, with game, poultry, and half a bottle of fair wine, for a dollar. Every delicacy in season finds its way from San Francisco and New York, and two oceans contribute their produce to the marbled and mirrored lunch counters.

Another development of the luxurious character of the citizens is a club after the metropolitan pattern, with richly furnished billiard-rooms and reading-rooms, where the bachelor may smoke the pipe of celibacy in peace.

They are nearly all bachelors in Virginia; the atmosphere of the place is by no means favorable to wives and children; the feminine element is very *décolletée* in manners as well as in dress, and yet there are good and affectionate women in the town, especially among the miners' wives, and we see them to advantage in times of trouble, when some wounded creature is brought to the surface from below. There are few boarding-houses; the upper parts of the stores and other buildings are let out as lodgings, and the meals are supplied by the many excellent restaurants.

While night has fallen on the visible town, the invisible town under-ground is glimmering with a thousand lights, just as it has been glimmering through all the summer days that have shone and all the winter nights that have lowered ever since the Comstock lode was first penetrated by a shaft. There is no repose in that mysterious region; none of the endless changes and renewals of season that sweeten existence on the earth; no relapse of day into night, or night into day; no summer, no winter, and no Sunday. The farthest journey possible on the surface could not take the traveller to a country half so miraculous as that which lies less than a mile below the parallels of familiar stores on C Street; it is as with a physiognomist, who, travelling in the interior of Africa, and scanning the strangest human faces among the natives, would not see any thing half so strange as the heart of his nearest neighbor, had he the power to probe the little depth of flesh that seals it and its innermost secrets. Nearly one-fourth of the whole population is hidden in the mines, and when we see how overcrowded the superficial area is, and realize how many more streets and people are out of sight, how the crest of the mountain is the roof of a seventeen-story building which is constantly sinking deeper into the earth, we are prepared to agree with the

PROFILE OF SUTRO TUNNEL.

proud citizen who assures us that Virginia is a "pretty considerable place."

It is estimated that two hundred and twenty million dollars in bullion have been extracted from the Comstock mines during the past sixteen years; in 1874 the yield was nearly twenty-two millions; in 1875 it was over twenty-two millions; and in 1876 the total yield of the State was over forty millions, a large proportion of which came from Virginia City.

In the winter of 1874-75 the great discoveries were made that added the Spanish word *bonanza* to the vernacular. The technical meaning of the word, which has long been in use among American miners, to whom it was introduced by Mexicans, is a large, rich body of ore; but it has found wider acceptance in the sense of an unexpected and brilliant stroke of good luck. Its antithesis is *borrasca*, which means barren rock, bad luck, or adversity.

About four miles over the hills east of Mount Davidson is a wide valley watered by the Carson River. It is much more convenient of access than Virginia, and is in other ways a more favorable site for the location of a city. A party of the Wheeler expedition, in charge of Lieutenant T. W. Symons, was encamped here during last September, measuring and developing a base-line, from which a system of triangles is to be extended; and earlier in the season another detachment of Lieutenant Wheeler's topographers made a survey which demonstrated the practicability of a railroad from this point northward to a junction with the Central Pacific. Few buildings have appeared, so far, although the ground has been laid out for a handsome town, and divided into spacious squares by broad streets, with irrigating ditches and lines of shade trees. From any of the neighboring elevations it looks like an immense checker-board without any men; but if the hopes of its projector are realized, it will eventually supersede Virginia, and become the great mining centre of the world. The name of the embryo town

is Sutro, and in the range of hills on the western boundary of the plain is the mouth of the Sutro Tunnel. As the mines are now arranged, every ton of ore extracted and every gallon of water that springs from the rock has to be hoisted from five hundred to two thousand feet, according to the level on which they accumulate. The water, of course, can not be pumped more than one hundred feet at a time; hence that which flows into the twentieth level has to be raised successively through twenty cisterns. The expense entailed by this system is enormous. Six hundred cords of wood, costing thirteen dollars a cord, are consumed every day by the hoisting works; and except in the case of the Consolidated Virginia, the ore having been raised to the surface, has to be retransported to the reduction mills, from ten to seventeen miles distant.

The mines of the Hartz Mountains in Germany are tapped to some extent by vertical shafts, but their principal outlets are horizontal tunnels, over twelve of which have been bored, including one that is fourteen miles long.

Among the prospectors who came to Virginia in 1859 was Mr. Adolph Sutro, a gentleman of scientific knowledge, who, as much for his own information as for any thing else, made several examinations of the lode. "I had expected to witness an extraordinary deposit," he has written, "but I may say that I was truly astonished at the magnitude and importance of the discoveries which had been made." In March, 1860, only forty tons of ore had been taken from the mines, and their reduction yielded \$160,000, or an average of \$4000 to the ton. As new claims were located and new mines opened, Mr. Sutro was impressed with the lack of system displayed. It appeared to him that instead of entering the lode from above, making heavy timbering necessary, and entailing many difficulties in working the mines, the better way would be to run a tunnel from a point low down on the hillside, and build a shaft to meet it; and he

ENTRANCE TO SUTRO TUNNEL.

A geological profile is published among the illustrations. The mouth of the tunnel is at A, about one mile and a quarter from the Carson River. At B, 19,790 feet, or about three and three-quarter miles, from the mouth, it will touch the Comstock lode. From this point a cross-tunnel will be extended north and south along the lode for a distance of 12,000 feet, at a depth of 2000 feet below the surface of Virginia City, that being the depth of the main tunnel. The tunnel, as far as it is complete, is twelve feet high, fourteen feet wide at the bottom, and thirteen feet wide at the top. It is massively timbered in places, and is laid with a double-track railway, at each side of which is a drain for water.

also thought of a tunnel, such as he had seen in Germany, which might drain all the mines on the lode both of their ore and water.

The thought was father to the deed. Against powerful opposition from some quarters, and with no less powerful assistance from others, Mr. Sutro has nearly consummated his design, which, although it is little known in the East, stands pre-eminent among similar works of the kind in America. The first stone was broken October 19, 1869, and on November 8, 1876, when the writer was at Sutro, the tunnel had been driven 14,915 feet through the mountains, the average progress being over eleven feet a day.

The advantages to accrue from the tunnel are these: The improved ventilation of the mines, resulting from the current of air, which, entering the tunnel at its outer extremity, and, after sweeping the mines, passing out at the shafts, will so cool and purify the atmosphere of the drifts that the health, and therefore the working capacity, of the men will be augmented; the drainage of the mines above the level of the tunnel, obviating the expensive hoisting-works, and a largely increased economy in working the mines by taking the ore through the tunnel to reduction-works at its mouth, instead of raising it to the surface and transporting it to the mills now established. The cost of the tunnel will be about \$4,500,000.

GIBRALTAR.

"In the dimmest northeast distance dawned Gibraltar, grand and gray."—BROWNING.

NO spot on earth is invested with a deeper or more various interest than the classic Calpe, the Pillar of Hercules, the "Shining Rock," which we call Gibraltar. The most ancient as well as modern literature celebrates its fame; it has been the subject of fables and legends innumerable; it has played a dramatic part in the fortunes of men and nations, certainly from the earliest historic times, and probably was the bone of bitter contention among prehistoric races. In splendid, sombre, solitary beauty no Titanic peak of nature surpasses it; it is more than majestic, it is awful, while it

rises above and is the look-out upon a landscape more varied, and endowed with more striking and sudden contrasts, than any famed eyrie of Alp or Himalaya. Alike in its history, in its natural features, and in its modern political and military significance, Gibraltar has an interest peculiar to itself. Rising as it does, rugged and in abrupt isolation, on a peninsula jutting into the Mediterranean, amidst level surroundings, and at a point where Europe very nearly approaches Africa, the rock stands on guard over the narrow strait, and is its unconquerable sentinel. It is the key of the Mediterranean, and

no vessel, of whatever flag, may pass or repass from sea to sea without leave from this sternest and most impregnable of all the fortresses of nature. It is a singular fact, and one which has had momentous results upon the career and fate of nations, that the Mediterranean has been thus pent up, or corked up, by nature at either end. In the west, Gibraltar may at any moment ordain that it shall be practically an inland sea; in the east, Constantinople, guarding the yet more narrow Bosphorus, divorces it from its sister sea, the Euxine.

The approach to Gibraltar by water, while it scarcely prepares one for the sudden and majestic looming of the "Shining Rock," which bursts upon the vision as Tarifa, with its picturesque old walls and towers, is left behind, is full of both historical and natural attractions. On the green and smiling Spanish coast are to be discovered the famous capes St. Vincent and Trafalgar, where the

the Moorish mountains. The contrast here, where

"Europe and Afric on each other gaze,"

is striking in the extreme. On the one side is a shore whose little capes are dotted with watch-towers, and whose sloping hills are green with orchards and orange groves, the country gradually rising to verdant mountains in the northern distance, to which the white villages and hamlets present a sharply defined variety of color; on the other are bleak and barren plains, a cold gray tint every where dominant, jagged and riven eminences, an unfruitful, dreary, and almost forsaken land. Nothing could be more impressive than these utterly different aspects of the

"Lands of the dark-eyed maid and dusky Moor;"

and the contrast is immeasurably heightened by the azure and glittering waters of the

GIBRALTAR.—[DRAWN BY SAMUEL COLMAN.]

naval contests were won which crowned Jervis and Nelson with well-earned laurels. On the opposite, or African coast, you espy Tangier and Cape Spartel; while, as you proceed, the other Pillar of Hercules, Ceuta, looms in the distance, and in the background rise the bald and ragged chains of

Mediterranean, which roll between and dash over the beaches and amidst the fissures on either shore.

The first view of Gibraltar, approaching it from the northwest, discovers a lofty, single-rock mountain, apparently separated from the land, rising above the strait some

fifteen hundred feet. Its sides are rugged and broken, here and there exceedingly precipitous. Around its base appears a cordon of batteries, while its summits are crested with walls and battlements. It forms one side of a bright and symmetrical bay, and just below its western cliffs the quaint old town clings to its base, while on the east long lines of barracks stretch beside the glistening beach. Between the town and the galleries by which the rock is ascended are the Alameda, or public park, and the fruitful and flowery gardens which are so often mentioned as flourishing at Gibraltar. The Alameda, in particular, is one of the most agreeable pleasure-parks in Europe. A portion of it is used as a parade-ground for the troops who garrison the giant fortress; the rest comprises rich green lawns, serpentine walks, with white marble seats disposed conveniently here and there, exquisite shrubbery, geraniums in profuse abundance, and groves of orange, lemon, and fig trees. On the upper terraces cool pavilions covered with vines invite the saunterer to grateful repose, while here and there you observe a bust of Wellington, and statues of General Elliott and other martial worthies. The Alameda and other gardens lend brightness and beauty to the slopes between the beetling and overhanging masses of sombre rock.

As to the "Rock of Taric" itself—for Gibraltar is so called, from Gibel, a rock, and Taric, the name of the Moorish chief who first effected a landing here in the eighth century, the pioneer of the splendid Moorish realm in Spain—it soon appears that it is connected with the main-land by a low sandy strip, which is called the "neutral ground," because it separates Spain from the English possession. The whole extent of the rock, from north to south, which is the direction in which its greater axis runs, is about two miles; the width, from east to west, one mile. On the north and east the rock is an almost perpendicular precipice from summit to base, this awful precipice being in some places more than a thousand feet in height. On the south side, however (that toward the strait and toward Africa), and on the west (that by which it is approached from the Atlantic) it descends by comparatively gentle gradations to the water. The most northerly of the three summits is called the "North Pinnacle," the middle summit is called the "Signal Station," and the more southerly "O'Hara's Folly," or "The Watch-Tower." This summit bears the name of "O'Hara's Folly" from the following circumstance: A certain General O'Hara, who was Lieutenant-Governor of the garrison, conceived the idea that from this eminence he might be able to make signals to Cadiz. In this opinion, however, he was alone. All the other offi-

cers scouted it as an impossibility. The general persisted, and caused the watch-tower, the ruins of which are still to be seen, to be built for the purpose. It then appeared that Cadiz could not be seen from it, because of the height of the intervening mountains. Not long after, the tower was struck by lightning and one of the sentinels was killed, and that was the end of "O'Hara's Folly." Imaginative Englishmen profess to see in the rock of Gibraltar the semblance of the figure of a crouching lion, which they are fain to call "the lion of England;" and indeed there is some warrant for the notion in the peculiar formation of the huge but by no means unsymmetrical mass.

The scenes in the lovely bay and in the narrow zigzag streets of the little town are bustling and full of life. The bay is dotted with ships and boats of many kinds, anchored in the shadow of the rock. On the quays of the town you recognize the reason of the saying that Gibraltar is an epitome of the three continents. Here, besides English and Scottish soldiers, who are met on every hand in the vicinity of the rock, are to be seen swarthy and handsome Moors from opposite Barbary, with their snow-white turbans, flowing robes, bare leather-colored legs, and loose slippers down at the heel; Jews from over the strait, in gaudy embroidered costumes, with broad varicolored sashes wound about their waists, and baggy white trowsers; Spanish smugglers, in tight-fitting coats and breeches, fastened down the sides with silver buttons; pretty dark-eyed women of Genoa, arrayed in scarlet cloaks and hoods, the latter trimmed with broad black velvet; Spanish beauties, with long lashes and languishing eyes, wearing their sweeping black lace veils and graceful mantillas; Highland soldiers, in plaid and tartan; and a race of acclimated English, bronzed and semi-Spanish in feature, the natives of Gibraltar, upon whom the Spanish have bestowed the rather uncomplimentary epithet of "Rock Scorpions." Out into the sea stretch the various "moles," the most conspicuous being the old and new moles, while at the northern end of the town rise the towers, battlements, and crumbling walls of the old Moorish castle—an imposing relic of the days of Moslem ascendancy. In the distance, among the hills and groves, peeps out the ancient little town of San Roque—a curious place, and well worthy a visit. Every where about as well as on the rock you are reminded of the fact that Gibraltar is, first of all, a fortress. Soldiers and guards, deploying, lounging, or on post, present themselves at every turn; high up on the cliffs the diminished figures of sentinels are seen pacing to and fro; in the pleasure-gardens the most noticeable persons are the officers, strolling and taking their ease; the tattoo of drums, the roar of cannon at stated

hours, the opening and closing of the great gates that separate the fortress from the town, all impress one with the military importance of the place. Still more marked appears the military character of the rock, as you glance up toward the beetling cliffs, and see, yawning from innumerable port-holes, and above long ranges of battlements, and from many an embrasure and turret, the cannon which guard the entrance to the Mediterranean; and as, curious to behold the marvels of the fortress in their details, you cross the draw-bridge, go under the low arched gateways, pass the parade and Alameda, ascend the irregular streets which creep in steps up the sides of the crags, leave behind the quaint old Moorish castle, and at last find yourself literally *entering* the rock through an iron gateway. The first glance reveals the immense labors which have been undertaken to perfect by art the defenses with which nature has endowed Gibraltar. One sees before him a series of galleries, tunnels, and excavations, conducting apparently into a blank of Cimmerian darkness. Here, far above the beach, are dug out long tunnels at the very edge of the headlong cliff; and as you pass along them, guided by the light of torches, you observe port-holes at intervals of fifteen or twenty feet, with brass ordnance peeping out menacingly from every one. Ascending constantly, you find that there is tier after tier of these tunnels. There, if necessity should arise, the gunners might stand and pour their deadly fire upon fleet or cohort, perfectly shielded by the massive and solid rock, which no missile, however destructive, could more than feebly indent. The Windsor Galleries, which are excavations wholly within the rock, form a continuous subterranean passage of two thousand feet in length, twelve feet high, and twelve wide, and this passage ascends by the same zigzag course which is seen in the great roads that wind over the Alps, till it gives an outlet near the summit. A spiral stairway from the tunnels brings one into a singular rotunda-like chamber, excavated from the solid rock, and named by the English masters of Gibraltar "St. George's Hall." This is a nearly circular apartment forty-five feet by forty, and twenty feet high; it is cut out in an immense jutting cliff, and is turret-shaped; from the embrasures in its walls cannon look out upon and keep watch over the sea; its floor is smooth, almost polished; and just by are well-stored magazines, ready for any sudden emergency. From the top of St. George's Hall the view makes one dizzy. The precipices, frowning above and descending below, a thousand feet in an almost absolute perpendicular, at every point bristling with cannon, and the rock seeming to have been torn and riven by mighty convulsions, present an actually startling specta-

cle. From this point you ascend to the Signal Station, the middle and highest summit of the rock; and here you find yourself on the loftiest of the Pillars of Hercules. The view is now exceedingly grand, and in certain directions beautiful. You can almost see Cadiz on one side, and many fancy at least that you can espy the snow-capped mountains of Granada in the curtaining haze on the other. Opposite rises the other Pillar, the modern Ceuta, the ancient Abyla; westward of this looms the noble and barren peak of Gibel Musa, the loftiest of the Moorish mountains, higher even than Gibraltar itself; while as far to the east as the eye can reach stretch the purple-blue waters of the Mediterranean, finding no limit till they wash the shores of Italy. Nearer at hand, you observe that the ridge of rock above which you stand is exceedingly sharp, and that on the east side it descends in a headlong precipice to the white sea-beach, hundreds of feet below.

Among the wonders of Gibraltar is the somewhat famous and not a little mysterious Cave of St. Michael. This is approached by an hour's rather painful clambering from the Alameda. The cave is reached from a platform about three hundred feet below the summit. You pass within a high irregular fissure in the face of the rock, and enter, by a small gate, a vast circular chamber but dimly lit from without. This cave you find hung with immense stalactites, while columns of strange, weird forms support the lofty arches of the roof. These, lit up by the torches, give a very grotesque and unearthly aspect to the place. From this chamber chasms and galleries lead here and there into the bowels of the rock; and one must grope carefully along them, holding the torches high to shed the light well upon the path ahead. After passing along the principal passage some four hundred feet, you reach the brink of a black, fearful gulf, the bottom of which no man has ever seen. You can only note the dark, slimy, jagged sides as they disappear into utter darkness; and by throwing down a torch, see by its brief glimmering, as it plunges into the abyss, what an awful chasm lies below. It is related that many years ago some English officers ventured to penetrate here before the exact position of the chasm was known; that the foremost fell headlong into it, to be soon followed by a second, who was groping about in search of his companion. This chasm is the passageway by which, according to the legends of Gibraltar, the apes that once thickly swarmed about the rock were wont to cross, under the sea, to their more secure retreat, the Apes' Hill, on the opposite Barbary coast.

Perhaps the most striking view of the rock is that from the beach, where it is to be seen stretched lengthwise along the pen-

insula. Here the portion immediately in front of you is the highest, and the precipice ascends perpendicularly for more than a quarter of a mile to the summit. The port-

double and treble outworks, as well as moats, draw-bridges, porteullises, palisades, trenches, sally-ports, ramparts, bastions, and every other appliance that can add security

to the defense of the wonderful fortress. It may be added that for many years the rock has been kept provisioned for six months ahead. A longer time would not be necessary, for the English could safely rely upon their unequalled war fleet to relieve Gibraltar from any danger of being starved out. The Governor lives in a cottage on the southern slope, below Windmill Hill; and at the very extremity of the peninsula rises a light-house, at "Great Europa Point," one hundred and fifty feet high. At the rear of the rock, between it and the marshy space called the "neutral ground," are gardens, the garrison burial-ground, a small beach used for bathing called the "Watering-Place," and a good race-course, which provides the English with the favorite home pastime when far out of reach of Ascot, Epsom, Doncaster, and Chester.

We have glanced at the most conspicuous features of Gibraltar as it appears to-day, and have seen, to some extent, why it is that Burke spoke of the fortress as "a post of power, a post of superiority, of connections, of commerce; one which makes us invaluable to our friends and dreadful to our enemies." Let us now briefly revert to some of the incidents in its history—a history which, if it could be told

THE SUMMIT.—[DRAWN BY SAMUEL COLMAN.]

holes along the galleries, far up on the sides, look like pigeon-holes, while the staff at the Signal Station seems no larger than a pin. The base is here girt about with ditches, stockades, and batteries, pointing in every direction toward the land approaches to the rock. Most of the excavations have been made during the century and a half that the English have been in possession of Gibraltar. Every where among them you see piles of huge cannon-balls ready for use on occasion; and it is said that it was a good day's work for a man to get one of these balls from the town up to its proper place in the galleries.

The garrison, which is below the rock, is also walled and mounted with heavy ordnance, while the fortifications nearest the water are immensely strong. Here are walls within walls, where the cannon are so ranged as to cut down an assailant at whatever point he might approach. There are

at length, would be found full of romance the most exciting, and of military exploits as thrilling as any in the annals of warring mankind.

At various remote periods, which space will not permit us to particularize, Gibraltar was successively in the possession of the Phœnicians, the Carthaginians, the Romans, the Goths and Vandals, and the Spaniards. But it was the Moors of Barbary who, coming thither to conquer Spain and to set up in Granada and Cordova one of the most splendid and flourishing kingdoms Europe has ever seen, that first fortified and built upon the great rock. It was here that Taric landed in 711, and from that year until 1309, nearly six centuries, Gibraltar remained in Moorish hands. In 1309, as a result of the first of the fourteen sieges to which Gibraltar has been subjected, it was taken by Ferdinand IV. But the Spaniards only kept possession of it for twenty-two years, when

it was retaken by the Moors, and held by them until 1462. In that year the Duke of Medina-Sidonia laid successful siege to it, and for two centuries and a half the Spanish held peaceful possession. Then came one of the most momentous and brilliant of Gibraltar struggles, for in 1704 it was taken by the English under Sir George Rooke. Taric fortified Gibraltar to some extent on taking possession in the eighth century, but it was not until the latter half of the twelfth century that fortifications were undertaken on an elaborate scale. In the year 1161 a great Moorish architect, Haji Yaix, was commissioned to perform this task; he constructed a fortress on the summit, with several towers, and at various points raised redoubts and battlements.

Of course the Spaniards were far from contented that the fairest domains of their country and its most formidable stronghold should remain in the hands of the barbaric and infidel Moslem, and many were the attempts to hurl them back to Africa. The first siege of Gibraltar, already referred to, was as brief as it was triumphant. The Castilians under Guzman attacked the rock simultaneously on all sides. Battering engines were used, which soon battered down the houses of the town and the walls of the redoubts; but the Moors intrenched themselves among the crags, and defended their eyrie for a month, when, being only eleven hundred, they were forced at last to give way from exhaustion, and surrendered on condition that they should be safely landed in Africa.

The fortress was unsuccessfully besieged by Ismail, a Moorish prince, in 1315; the third siege, however, in 1333, resulted in the restoration of Gibraltar to the Moorish dominion. A romance is connected with the story of this siege. As with many historical events of importance, the beauty of woman had something to do with it. It appears that at the battle of Martos, gained by the Moors, a damsel of striking beauty had been taken prisoner. At the peril of his life, Ben Ismail, a young Moorish prince, rescued the girl from the violence of the soldiery. Ben Feraz, the king, fell in love with her, and took her away from Ben Ismail. The latter, overcome with rage and jealousy, assembled next day some of his friends on the road by which the king was to pass, and pretending to salute him, rushed upon Ben Feraz and stabbed him to the

heart. The succession to the crown passed to Mohammed, the son of Ben Feraz, who, as Mohammed IV., laid siege to the fortress of Gibraltar. The Moors attacked it by a *coup de main* and blockaded the garrison, who were so poorly supplied with provisions that they would have been speedily starved out had not a grain ship been cast ashore within their reach at a most opportune moment. This, however, only postponed their fate; for, after holding out five months, during which the Governor, an avaricious fellow, fed the Moorish prisoners well in the hope of gaining high ransoms, while he forced his own men to munch leather, the rock was surrendered, and the Moors once more ensconced themselves upon it.

Gibraltar underwent seven sieges between the time of the Moorish recapture of it in 1333 and their final abandonment of it in 1462. In the latter year Henry IV. was King of Castile; Mohammed IX., King of Granada.

STREET SCENE, GIBRALTAR.—[DRAWN BY SAMUEL COLMAN.]

One day a converted Moor went to Alonzo of Arcos, Governor of Tarifa, and told him the opportunity to capture Gibraltar was now ripe. Dissension was rife within the for-

tress; it was carelessly guarded; its defenses were neglected; its provisions were not ample. Alonzo at once resolved upon the attempt, and at daybreak the next morning he had landed at the base of the rock with a body of troops. He found that it was useless to assail Gibraltar without a larger force. This arrived promptly, and he made an assault. He was repulsed, and would have retreated altogether had he not learned from a deserting traitor that the garrison was violently divided, and that the distress within was great. While Alonzo was hesitating, a message was sent to him from the garrison, asking permission to leave the fortress with their property. He evaded a reply until young Rodrigo, Count of Arcos, arrived; but this higher authority was equally vacillating, and postponed his answer till the Duke of Medina-Sidonia, the head of the great house of Guzman, should come. But Rodrigo at least sent a force to take and hold the city gates, and the garrison retreated to the keep. When the duke arrived he was very angry with Rodrigo for going so far as he had done, and proudly claimed precedence in making the capture. As the duke's estates lay near, he was very anxious not only to get the Moors out of Gibraltar, but to hold it himself. The dispute waxed so high that the duke and young Rodrigo could scarcely be kept from coming to blows. At last it was settled that they should enter the fortress side by side, and that their banners should be mounted on the keep at the same moment. The King of Spain proclaimed himself "Lord of Gibraltar," and gave it in charge to the Duke of Medina-Sidonia.

The Moorish power was now rapidly waning in Spain. The Moors fought each other instead of the common enemy, and frequent rebellions sapped the order and prosperity of the state. The decadence of Mohammedanism in Spain was coincident with its rise at Byzantium. The capture of Gibraltar by the Spaniards was the first great blow at their authority, and was followed, some years later, by the fall of Granada itself. A certain Beltran de la Cueva was appointed Governor of Gibraltar. A civil war now arose in Spain between the reigning king, Henry IV., and the party of his brother Alfonso, who had pretended to the throne, but had died. Beltran sided with Henry, and the Duke of Medina-Sidonia with the Alfonsists; and the ninth siege of Gibraltar was undertaken by the latter, to get it away from Beltran and the king's party. The duke did not try to attain his end by stratagem or surprise, but marched his army up in full daylight, to the sound of drums and trumpets. He took the town, the garrison retreated within the fortress, and the siege was vigorously begun. It lasted no less than sixteen months, and was conducted with the greatest valor and self-sacrifice on both sides. At last the repeat-

ed assaults and lingering famine did their work, and Gibraltar was surrendered to the ducal rebel—the same man who had, years before, delivered it out of the hands of the Moors into those of the king whom he now opposed.

Gibraltar remained in possession of the house of Guzman, under royal grants, until the accession of Isabella to the throne of Castile. Henry was too much harassed to keep the Duke of Medina-Sidonia in enmity, and the grant of Gibraltar was enough to make the duke a friend. But Isabella insisted that Gibraltar should be ceded to the crown of Spain. This the Duke Juan opposed for a time, but at last was compelled to yield; and now Ferdinand of Aragon used the rock as a point from which to invade the African Moors in turn. Isabella—certainly one of the greatest sovereigns who ever sat on the Castilian throne—saw the full importance of Gibraltar to the united kingdom of Spain, and left it as a solemn injunction upon her successors "to hold and retain Gibraltar for themselves and in their own possession," and that "no alienation of it, or any part of it, shall ever be made from the crown of Spain."

As soon as she was dead, the Duke Henry, whose father, Juan, had ceded the fortress under duress, and who had taken the loss keenly to heart, resolved to attempt its recapture; and his unsuccessful siege of it, which lasted for four months, and which, from its entailing no loss of life, was called the "bloodless siege," was the tenth to which Gibraltar had been subjected since the days of Taric.

The rock underwent other vicissitudes from time to time in the following years, being threatened by the corsairs of the Mediterranean, and beholding the exodus of the last remaining Moors in 1609–10, who, comprising about six thousand, were transported across the strait at this very place, where the victorious legions of Musa and Taric had landed nine centuries before; while it also witnessed the desperate naval fight between the Dutch, under Heemskerk, and the Spanish, under D'Avila, which took place almost under its shadow in 1607—"the most furious battle," declares Sully, "which was ever fought in the memory of man."

The capture of Gibraltar by the English was an incident of the famous War of the Succession. The Spanish king, Charles II., died and left his crown to Philip of Anjou, grandson of Louis XIV. of France. But a German prince, the Archduke Charles, laid a counter-claim to the succession. England and Holland, determined that a French prince should not become King of Spain, and thus unite the interests and fortunes of his native and his adopted country, espoused the cause of the Archduke Charles, and declared war in his behalf. It was resolved by the

allies to attempt the capture of Gibraltar, and the combined fleets sailed for that destination in the midsummer of 1704. The British squadron anchored in the bay, and five thousand men were landed north of the rock to cut off land communication with the rest of Spain. The investing fleets comprised forty-five ships, six frigates, seven fire-ships, and two hospital ships. Meanwhile the garrison on the rock was certainly less than three hundred men, and some state that it was barely one hundred and fifty. The fortress was summoned to surrender to the "rightful" sovereign, the Archduke Charles. A prompt and resolute refusal was returned, and allegiance to Philip proclaimed. The next day the fleet began its assault; the new mole, and then the old, fell into the hands of the besiegers, and the marines landed at those points. The garrison had nothing to do now but to offer to surrender, and the offer was accepted on the conditions asked for, which were, permission to retain their property, six days' rations, three brass cannon, and twelve rounds of ammunition. They were also accorded the honors of war. In less than three days from the appearance of the allied fleets in the waters of the strait, the great fortress had thus fallen into the hands of the besiegers. The larger portion of the inhabitants removed to San Roque.

Now occurred one of those many instances, in the history of English warfare and conduct, of English fidelity to the principle that "might makes right." Gibraltar was taken possession of in the name of the so-called "Charles III. of Spain," namely, the archducal claimant, by the Prince of Hesse-Darmstadt. But this did not by any means suit the projects of Sir George Rooke, the commander of the English fleet. He deliberately pulled down the standard of Charles, and the Germans and Dutch were somewhat amazed to see the British flag run up in its place. In a word, Gibraltar was seized in behalf of Queen Anne, and so passed into English possession. Seven years later, this was finally confirmed by the Treaty of Utrecht, which brought to an end the War of the Succession. Sir George Rooke was not made a peer, nor did he get a pension.

Gibraltar has undergone three sieges during the century and a half that it has been in the hands of the English. The very year of Rooke's great victory had not passed before the French and Spanish tried to regain it. This siege was sharp and fierce, and several times it seemed as if the assailants must succeed; but the arrival of re-enforcements and provisions enabled the English to continue a vigorous defense, and after a siege of six months the allies were forced to throw up the game. It was not till 1727 that the next attempt was made to wrest the fortress from its British conquerors. Once more the Spaniards were the assail-

ants. It was a most obstinate and determined fight, but an attack lasting through five months only resulted in the utter discomfiture of the attacking power.

The most memorable, in some respects, of all the fourteen sieges to which Gibraltar has been subjected was the last, called the "great siege," one of the mighty struggles of history, which began in the year 1779. The famous General Elliott was commander of the fortress. Spain, in alliance with France and Morocco, endeavored to surprise Gibraltar; but a Swedish ship gave Elliott the alarm. The garrison comprised but five companies of artillery, and the whole force was less than five thousand five hundred men. The enemy's force was fourteen thousand. The siege began by the blockading of the port, and a camp was formed at San Roque with the design of starving out the garrison. When the English Governor resolved to open fire upon his besiegers, a lady in the garrison fired the first shot. Never did a siege war rage more furiously than did this for nearly three years. The garrison was often reduced to sore straits for food; "a goose was worth a guinea," and Elliott tried upon himself the experiment of living upon four ounces of rice a day for a week. Exciting stories are told of the privateers that ran in, amidst terrible dangers, with provisions, and of the storms which threw welcome wood and cork within reach of the besieged. The rock at one time would surely have been taken had it not been for Admiral Rodney, who, sailing off the strait, captured a small fleet of Spanish war ships and merchantmen, and clearing the strait of besiegers, brought his prizes into port. But all danger was not yet averted; Gibraltar was again blockaded; scurvy broke out in the garrison, and Morocco refused her harbors to English ships. The enemy crept closer and closer to the fortress, but relief coming every now and then enabled the English still to hold out. The bombardments were fearful to endure. "The city was almost destroyed; scarcely a house habitable, and those left standing pierced by shot and shell." At one time the desperate garrison fell to plundering the town; Elliott shot the leaders in this outrage. The long agony, full of terrific combats and frightful privations, ended by the final abandonment of the siege early in 1783. If in that year the English had to make up their minds that they must let go their American colonies, they had at least the consolation that Gibraltar was still theirs.

Except a brief but sharp naval conflict near by, in 1805, Gibraltar has since the "great siege" remained in the undisturbed possession of the English; and thus the great fortress bids fair to remain, as long as the naval prowess of England continues to be unrivaled on the waters of the earth.

MOSES CLYMER'S BUSINESS.

WHENEVER I pass that dingy four-story building on Nassau Street in which Barry and I first established ourselves as attorneys and counselors at law, I am led to wonder what has become of Moses Clymer. Eighteen years ago, when Barry and I occupied the back-room on the third floor of this building, Moses did a thriving business in the apartment directly opposite. I say thriving, because many persons passed in and out of that apartment, so that the bell, which was fastened over the top of the door, kept up an almost continuous ringing. Every body who ascended the stairs to the third story appeared to enter Clymer's room. I recall now, with a sad smile, the numerous disappointments we suffered because of this singular partiality which was displayed for Moses's office. A score of times, at least, during the first day or two following our removal to the building, Barry raised his eyes from the pages of *Pendennis*, listened a moment to the sound of footsteps on the stairs, and then dropping *Pendennis* and seizing a pen, fell to covering a sheet of legal cap with his own signature. A brief moment of delightful expectancy, while the footsteps paused on the landing without; a spasm of hope that at last a client had come; and then the tinkling of the bell over Moses's door, and a sudden sinking of spirits in the manly breasts of Barry and Bushnell. Following these dashed hopes, a dashed exclamation from the senior member of the firm, a resumption of *Pendennis*, and unbroken silence.

Yet it was not of vital importance that clients should come to Barry and Bushnell. They were still young men whose parents regarded them as boys, and whose good fortune made it unnecessary for them to take any thought of the morrow. They knew that their bread, buttered with tolerable liberality, would be forth-coming whether clients came or not. Yet it was somewhat embarrassing, at the expiration of three weeks, to be forced to acknowledge that neither man, woman, nor child had made application for their professional services. To this embarrassment was added a touch of exasperation at the thought of Moses Clymer's steady stream of callers.

"Wonder if he's a lawyer?" said I, one day, breaking the silence which had followed the sound of the bell.

"I think not," answered Barry. "He would have a sign if he were."

"Perhaps he is a note-shaver," suggested I.

"Possibly. He does a rushing business, whatever its character. I purpose to keep my eyes open and find out what it is."

Barry attempted first to get his eyes open by interrogating the other occupants of the building. Not one of them could tell how

Moses Clymer earned his livelihood. Opinion was divided. Firman and Co., the stationers on the first floor, did not know that there was such a man as Clymer in the building—so close the intimacy which life in a metropolis breeds! Dickerson and Smith, engravers, second floor front, believed Mr. Clymer to be a lawyer. Jennison Brothers, lawyers, second floor back, supposed Clymer was a physician. (In support of this conclusion, they cited the fact of having seen a number of consumptive-looking men pass into his room.) Doyle, stenographer, fourth floor, was inclined to the opinion that Clymer was an insurance agent, with some interest in real estate. By the time Barry had made an end of his inquiries, he found that his eyes were not opened with respect to Moses Clymer's occupation. His curiosity, however, was whetted to a keener edge.

The testimony of the Jennisons, whom Barry and I hated cordially, first, because they were lawyers, and second, because they were lawyers with clients—the testimony of the Jennisons, I repeat, corresponded precisely with what we ourselves had observed. Not only did consumptive-looking men pass into Moses Clymer's office, but men, also, whose general appearance hinted of indigestion, and possibly biliousness. Without the aid of a very vivid imagination one found it easy to associate all manner of diseases with Moses's callers. Moreover, there was a certain dilapidated air about them—a shabbiness of dress and a uniform uncleanness of person—which suggested at once the need of tonics and soap. Obviously Mr. Clymer's business, whatever it might be, gave him acquaintance with a very peculiar class of people. There was a certain negative resemblance traceable in them all, and some points even of positive likeness. Apart from their usually shabby clothes and the decayed appearance already mentioned, it was noticeable that they frequently carried rolls of paper in their hands, which they left behind them upon emerging from Moses's room.

Barry was pleased to devote much time to speculation regarding our neighbor across the hall. When his inquiries had served only to sharpen his curiosity, he determined to pay Moses a visit. This he did, but without satisfying himself as to the nature of the business carried on by Mr. Clymer.

"There isn't any thing in the room," said he, "to indicate what the man does. A desk or counter stands in the middle of the floor. This is shielded by a ground-glass top, like the teller's desk in a bank. At one end of the room is a partition six or seven feet high, with three doors, all of which were closed. I noticed a big safe and numerous packages of papers, evidently manuscripts, arranged on shelves behind the counter."

"Did you see Moses?" I inquired.

"Yes, and talked with him—asked him to lend me a tack hammer. He said he hadn't one. Then one of his mysterious-looking callers came in and seated himself without speaking a word. Evidently he was waiting for me to clear out, so I cleared."

This visit left us more in the dark than ever. Barry, who delighted in mystery, began straightway to weave a romance about the bald head of Moses Clymer. That he was neither a lawyer, doctor, merchant, nor priest, was no longer a disputed question; that his buttons would count down to a thief, seemed strongly probable. Unlimited leisure, which professional duties did not interrupt, gave Barry the opportunity to prosecute his investigations with untiring

Poe's *Tales*—under a pile of papers, and, as the senior member of the firm, turned to his first client. As the junior member of the firm, I picked up a copy of the *Session Laws*, and looked becomingly grave.

"Vat is te charge for advice?" inquired Moses.

"That will be determined after you have stated your case," replied Barry.

"Vell, ten, te case vas like dis. Suppose a man vas come to you and sells you a piece of werse—"

"A piece of what?" interrupted Barry.

"A piece of werse—poetry, you know."

Poetry! Was this, then, the mysterious merchandise in which Moses dealt? I kept the *Session Laws* before my eyes, but did not

"WILLIAM."

vigor. And the more he investigated, the more knotty appeared the problem. The consumptive-looking callers continued to pass in and out; the bell rang at irregular intervals throughout the day. Now and then we met Moses in the hall or upon the stairs, but his business remained a matter of mystery. At the end of a month, Barry, who had made a number of visits to the room across the hall, but with no better results than those attending the first, gave up the riddle in despair. And thereupon, as it happens sometimes with the more complex riddles of life, came an answer to this one from a source least expected.

Moses Clymer entered our office one morning, and announced that he wanted legal advice.

Barry thrust the book he was reading—

discover that I held the volume upside down. Barry's composure was simply astonishing.

"Verse," said he. "Exactly. Well?"

"Vell, you pays dis man for te piece of werse, and den you finds out dat he stole it all from a book. Now vas dere no laws vich vill get back te money vat you pays to dat man?"

"Let me understand you fully," said Barry, with the air of a veteran counselor. "You purchase a literary article, believing it to be an original production. After you have paid for it, you discover it to be a plagiarism."

"A vich?" interrogated Moses, doubtfully.

"A plagiarism—a stolen production."

"Yes, dat vas it. Stole out of a book. And I advanced two tollars and feefy cents on dat piece of werse!"

"You bought the verses for two dollars and a half?"

"No, no. I buys notings. I loans te money, and takes te wersed for security. And dey vas stole out of a book!"

This remarkable revelation, this sudden flood of light upon the mystery which had hitherto enveloped Moses Clymer's business, produced no visible effect on Barry. One might have supposed that he had known what that business was for years, and that from his childhood up he had been familiar with pawnbrokers' shops where the fancies of the brain, instead of overcoats and watches, were accepted as security for loans. For myself, I found it impossible to longer feign an interest in the inverted volume of *Session Laws*, and closing the book, made no further attempt to conceal my amazement.

Barry proceeded to probe his first client with polite but searching interrogatories.

"Your business, then, as I understand it, is that of a pawnbroker, and you make loans upon literary articles?"

"Yes, dat vas it," replied Moses.

"Are you not frequently imposed upon?" inquired I, wondering how in the name of reason a man could detect a plagiarism who did not know the meaning of the word.

"Imposhed upon?" repeated Moses, raising his eyebrows. "Vell, I never vas imposhed upon before. Villiam he knows vat is good and vat is bad. He can tell vat is stole, as I can tell gold from brass. Villiam he knows all vat is in te books—but he vas mistaken about dat piece of werse."

"I take it that William is your critic?" said Barry.

"Yes, Villiam he decides vat an article is vorth. I knows notings about any of them. You might bring me Byron or Shakspeare—it vas all te same to me. But it vas not all te same to Villiam."

"What do you do with the articles that are not redeemed?" I asked.

"Ve sells 'em—very sheap, very sheap indeed. Dere vas leetle profit in our business. And I advanced two tollars and feefty cents on dat piece of werse!"

Barry checked further curiosity, that he might regard the case from a professional point of view.

"This opens up a very intricate question of law, Mr. Clymer. I shall need some time to consider it. Of course, if a suit were begun, the expenses would be greater than the amount of your claim."

"Vell, it is not te money so much as te example vat I vants. If te law could punish dis fellow, I vill not care if it takes all of te two tollars and feefty cents."

Moses here rose from his seat, and Barry informed him that he would be prepared to express an opinion when he had given the case proper attention.

"Doesn't this beat any thing you ever heard of?" he exclaimed, as the ringing of the bell announced Moses's entrance into his own room.

I thought it did, unquestionably.

Barry, I fear, did not devote much time to a consideration of the legality of his first client's claim; but his interest in the case was certainly profound. He came into the office on the day following Moses's visit, and exclaimed, triumphantly,

"I have been in to see Clymer, and tomorrow we shall have an opportunity of learning as much as we please about his business."

On the morrow, accordingly, Barry and I called upon our neighbor across the hall.

"Valk right into Villiam's office," said Moses, as we entered the room.

Barry, who seemed to have made himself thoroughly familiar with the place, led the way to one of the small compartments of which he had spoken, and I followed. There we found "Villiam," otherwise Mr. William Crampton, with his feet, incased in shabby gaiters, resting upon the ink-stained top of a pine table. He was a man of fifty or thereabouts, who might have been any thing to accord with the particular surroundings in which he was seen. With a white cravat and clothes of ecclesiastic cut, you would have set him down as a clergyman. In a checkered shirt, with a diamond sufficiently large and lustreless, you might have mistaken him for a bar-tender. In Moses Clymer's inner office he could be nothing but a critic.

Ten minutes' conversation revealed the fact that Mr. Crampton was a man of wide reading, undoubted culture, and superior critical taste. The same length of time served also to reveal the execrable quality of the tobacco which he used, and the astonishing quantity of beer. An earthen pitcher of this latter beverage was applied to his lips at intervals of four or five minutes, and the diminution of the contents during one of these draughts was something truly surprising. We stood the smoke manfully, however, and forgave the periodic interruptions occasioned by the beer. Mr. Crampton's conversation was worth these minor drawbacks.

"This business surprises you, no doubt," said he, laying down the pitcher tenderly.

"Well, yes, it does," rejoined Barry.

"Moses, here, has been engaged in it six or seven years. The old fellow must have made a snug little fortune during that time. He gets hold of his wares for almost nothing, and sells them always for a fair price. His profits last year amounted to more than three thousand dollars."

"You say that he sells his wares always for a fair price. Where does he find a market?" inquired I.

"With some of the magazines and newspapers. He makes arrangements with the

editors, who pay him so much a year, and get in return a given number of articles in prose and verse. He runs no risk. The periodicals themselves take the chances as to the availability of the pieces they receive. Of course there must be proper discrimination used in deciding what articles we shall accept here; but when that is done, Moses is sure of his profits."

"Then," said Barry, "the success or failure of Clymer rests altogether with you?"

"Well, Moses is certainly not a judge of literary work, and he leaves that to me. But I am not entitled to all the credit—not by any means. I occupy simply the position of a reader on a periodical publication—which, I may explain, was my calling before I became associated with Moses. After I have decided favorably upon an article, and the thirty days during which it is held subject to redemption have elapsed, then it is passed into the hands of Mr. Peters."

Here Crampton refreshed himself with another draught of the beer. He then continued:

"Mr. Peters is our polisher. By that I mean that he prepares the unredeemed pieces for the press. His duties are very much more laborious than are mine, and he is justly entitled to a goodly share of the credit. He takes a piece of verse, for example, rubs it down, so to speak, throws out or adds to it a stanza, props up a limping line, smooths out the rhythm, and corrects the faulty rhymes. That is what we call polishing. A prose article is put through a similar process, and sometimes even entirely rewritten. The ideas, you see, are worth saving."

At this point Moses opened the door and laid a manuscript upon the critic's table. The critic thereupon drew inspiration from the pitcher, and then proceeded to pass judgment on the verses. Barry and I watched him with undisguised interest.

"Our rhymsters nowadays," said he, "are little better than echoes. They give us musical lines, but their thoughts are all borrowed. Here, for instance, are some neatly constructed stanzas, but we find the ideas to be wonderfully familiar. Our author says:

'Now hope is dead and joy is fled,
Earth is barren, life is vain;
For with anger toward my love
Worse than madness racks my brain.'

That would be better if we could forget the lines of Coleridge,

'And to be wroth with one we love
Doth work like madness in the brain.'

"The author may have been unconscious of the plagiarism," suggested Barry.

"Very true," answered Crampton; "but that unconsciousness proves his want of

originality. His ideas are the outgrowth of his reading simply. He falls into the ruts which the wheels of other chariots have made. He finds it infinitely easier to pluck the fruit which has ripened in another's mind than to sow the seed of fresh thought, and nourish it to fructification. He drinks of twenty streams, and then gives us a flavor of them all. That flavor is sometimes excellent, but rarely new."

With this illustration, Mr. Crampton took another drink of the beer. Then, still scanning the pages of the manuscript, he continued:

"Here is another striking example of what I mean. The writer of these verses sings,

'When golden thoughts bring in their train
Sad thoughts which still are sweet.'

That is Wordsworth, and I can not say that it is an improvement. The dead laureate puts it.

'In that sweet mood when pleasant thoughts
Bring sad thoughts to the mind.'

"Have you pashed on dat piece of werse?" inquired Moses, thrusting his head through the door.

"It will do," answered Crampton.

"Vat shall I say about it dat is bad?"

"Too much of Coleridge and Wordsworth."

With this, Moses took the manuscript and withdrew.

"What amount will be advanced on that piece?" inquired Barry.

"I really couldn't tell," answered Crampton. "Moses takes charge of that, you see. You might step around behind the desk, and watch him while he makes the loan."

Barry and I were glad enough to act upon this suggestion. We found one of the consumptive-looking gentlemen, whose appearance had once led to the belief that Mr. Clymer was a physician, engaged in earnest conversation with the pawnbroker.

"Really, Moses, you ought to make that an even two dollars. Eight stanzas, you see. Rhythm smooth, and rhymes all perfect."

"One tollar and seeventy-feeve cents is all vat I can allows," rejoined Moses, decisively.

"But you advanced two dollars on those sonnets last week. These verses are much better than those."

"Dere vas too much of Cooleridge and Vadsvorth in 'em," rejoined Moses, disparagingly. "Dat is vat ails 'em—too much of Cooleridge and Vadsvorth. I vill gives you one tollar and seeventy-feeve cents."

This offer was finally accepted, and Moses made out the ticket and paid over the money. Then he turned to us, saying,

"Ve can not affords to pay too much on articles like dat. Dere is not demand enough,

you see, and dere vas too much Cooleridge and Vadsvorth in 'em."

"Are any of these manuscripts ever re-

"The articles which are brought to Moses," he resumed, "without first having been submitted to an editor constitute only a small

"DERE VAS TOO MUCH OF COOLERIDGE AND VADSVORTH IN 'EM."

deemed?" asked Barry, when we had returned to Crampton's room.

"Yes, occasionally," replied the critic. "The writer can redeem them at any time within thirty days, and occasionally he avails himself of this privilege."

Crampton here availed himself of the privilege of moistening his lips at the mouth of the pitcher.

part of what we receive. By far the larger proportion of the manuscripts are those that have been returned to the authors as unavailable. We take them, polish them, and sell them to less exacting publications."

"Mr. Clymer must feel his absolute dependence on you and Peters," suggested Barry.

"But he also makes us feel our depend-

ence upon our own exertions," was the rejoinder. "We receive no salary for our work, but a given percentage on the articles which are published. If I decide favorably on a poem, and that poem is thrown out by the editor to whom Moses carries it, then the sum which was originally advanced to the author is deducted from my percentage."

"In other words," said I, "Clymer is willing to share the profits but not the losses of his business."

"It amounts to about that, and yet Peters and I are well paid for our work. You see, we are able to select from a varied assortment, and to get the kind of matter which is suited to a particular publication. It rarely happens that we make a mistake."

"Or that you advance money on verses taken from a book," observed Barry, with a smile.

"The case which Moses has laid before you is the only one of that nature which ever occurred. Sometimes we have had stolen articles brought to us—all pawnbrokers' shops must expect that—but we have invariably detected the theft. The plagiarisms are usually glaringly apparent. Some months ago, I remember, a chap presented Byron's 'Maid of Athens,' and wanted two dollars on it."

Crampton was interrupted at this point by a thumping on the partition wall, while a voice from the adjoining compartment said,

"I want a two-syllabled word that is synonymous with 'endeavor.'"

"Attempt," rejoined Crampton, after a moment's reflection. Then, addressing us, he added, "That is Peters. Suppose we step in and see him."

We found Mr. Peters hard at work polishing a poem. He was a younger man than his associate, with a prominent nose, which his biographer would probably call Roman, and with the hair and shirt front of a genius. By way of illustrating the nature of his work, he read us some verses, first as they had been received by Moses, and afterward as they came out of the polishing process. Before we left the room, I obtained permission to make a copy of these stanzas in both forms, which I have preserved up to the present time. While the lines possess little of poetic merit, I may nevertheless be pardoned for presenting them here as illustrative of Mr. Peters's manner of work.

In the original form they read as follows:

SHERRY WINE.

I will drink this amber-hued,
Ripe, and rare old sherry
To the maiden whom I loved—
Fair was she and merry—
Loved and wooed so long ago:
When it was I scarce may know.

I will drink to those old times
When to breathe was pleasure;
When my heart, like sweetest rhyme,
Beat to Love's own measure;
When the dreams of youth were mine,
Amber-hued, like this wine.

From the goblet I will drain
Time's forgotten flavor,
Taste those happy days again,
Sweetened by Love's own favor—
Days when through Love's magic hands
Life ran all in golden sands.

What if love be at an end,
Life no longer merry,
Still I'll drink and drink again,
In this rare old sherry,
To the girl I loved and wooed
When the world was amber-hued!

Polished by Peters, the verses read thus:

A SONG.

I will drink this amber-hued,
Aromatic sherry
To the girl I loved and wooed—
Modest maiden merry—
Loved and wooed so long ago:
When it was I scarce may know.

I will drink to those old times
When to breathe was pleasure;
When my pulse, in rhythmic rhymes,
Beat to Love's own measure;
When the dreams of youth were mine,
Amber-hued like sherry wine.

From the goblet I will drain
Time's forgotten flavor;
Taste those golden days again,
Sweetened by Love's favor,
While I feel the draught divine
Warming all my blood like wine.

What if love be at an end,
Life no longer merry,
Here's a true and trusty friend,
Aromatic sherry;
Truer than my love, I know,
Many, many years ago!

"You will observe," said Peters, when he had finished reading the verses, "that there is substantially little change in the second copy of the poem. One or two imperfect rhymes are corrected—as, for example, 'times' and 'rhyme' in the second stanza—and some redundant syllables are dispensed with to preserve the metre. In the main, however, the verses are alike. That couplet,

'Days when through Love's magic hands
Life ran all in golden sands,'

smacks a little too strongly of Tennyson to pass muster. I have therefore thrown it out, although I can not say the substitution is an improvement."

"Your work must be very laborious, Mr. Peters," suggested Barry.

"It is what I may term 'headachey,'" was the rejoinder. "Still, I get along tolerably well, and do not feel justified in swearing except when a parody on Poe's 'Raven' turns up, or a new version of 'The Bridge of Sighs.'"

Before Barry and I made an end of our visit, we passed around behind the counter, where Moses was engaged in assorting the numerous packages of manuscripts.

"On te top shelf, dere," said he, "vas stories, nice stories, vich ve sells very sheap. You vas never seen nicer stories any vheres. On te next shelf vas wersed—love wersed. Dey vas really beautiful, and sheap—very sheap. On dis shelf here vas wersed on 'Spring'—and dey vas sheap too. Dose pelow vas all on deaths. You could not read one of dem vidout weeping, dey vas so beautiful and so sheap! Ven somebody in your family dies, dis is te place where you can find nice poetry vat vill comfort you. And it vill cost you only a leetle. Dat large package vas all pieces on te 'Old Year.' Dat one next to it vas on vine and other drinks. Dis package here vas made up of sonnets—ve gives 'em away, almost. Every thing vat you sees vas nice and sheap!"

"And not too much of Coleridge and Wordsworth in them?" said Barry, with a smile.

"Oh my, no!" returned Moses, warmly. "Dere vas no Cooleridge, no Vadvorth, in any of 'em. Peters he vas take all dat out."

When at last we took leave of the pawnbroker, Barry announced that he would be prepared to express an opinion on the merits of Moses's case in the course of a week; and Clymer again assured us that he would cheerfully pay the whole of the two dollars and fifty cents, if by so doing he could make an example of the impostor who had obtained a loan on verses taken from a book.

I regret to say that Barry did not keep his word. Mr. Clymer was left in doubt as to whether he possessed the right to institute legal proceedings against the plagiarist. And not many weeks afterward we discovered that he had moved from the room across the hall to parts unknown. The firm of Barry and Bushnell may now be found in a more aristocratic neighborhood than of old. Yet I never pass that dingy building on Nassau Street without wondering what has become of Moses Clymer. And I never turn to the poetry in a periodical without reflecting that perhaps these self-same stanzas have secured a loan of two dollars from Moses, have been favorably passed upon by Crampton, and have had the Coleridge and Wordsworth taken out of them by Peters.

AN ORDER FOR A CAMEO.

It shall be Eve's face, carver, gleaming white

Upon the Eden-green of chrysoprase:

Child-foreheads in the morning are less bright,

And Gabriel's less serene. You know her gaze,

Unfolding from pure lids, saw Adam first,

And then a glorious, cursed Earth uncursed;

So Memory will not darken that still smile

(Laughter was born of tears), nor Love's grand pain,

Nor thorns, nor dying lilies, nor cold rain

Betray her to a glimpse of afterwhile.

Miriam and Sappho show the sorrow-stain,

And Mary's loving hath its selfish guile.

Eve knows not Hope's unrest, nor Fear's alloy,

And blesses with the sweet lost dream of Joy.

BIRDS' NESTS.

TO those of my readers who have never studied birds, let me say a few introductory words. In birds, as a class, are combined colors which vary from the plainest browns or grays to the richest metallic splendors; grace, strength, and often sublimity of action; and musical powers that other animals lack altogether. To the naturalist, or to him who loves an out-door life, their abundance and peculiar relations with man offer great advantages; to the scientist they present in a marked way the phenomena of variation and adaptation. In a limited space, such as New England, where not many more than three hundred species have been known to occur, a tolerably thorough knowledge of them may be gained. Have the plants or insects been numbered? Mammals and reptiles, on the other hand, are comparatively rare and shy, and by many of them most persons are too easily frightened.

To embryologists, birds' eggs have a peculiar interest, and in no other form are the first outward stages of animal life so attractive to the ignorant. Among their nests are the highest types of natural architecture, though many birds lay their eggs on the ground, on rocks, or in natural hollows without special preparation. Their nests may be divided into several classes—those supported from beneath, those supported from above (or pensive), those attached on one side, and those which are excavations (in earth or wood). There are many other methods of classification, but that just used is most convenient for my purposes.

Let us take up the first class, and consider the ground-nesting birds. A striking fact is their generally plain coloring, and the prevalence of browns and quiet greens among the tints of their upper parts—the back, etc. As a general rule, their eggs also are plainly colored (though rarely white), especially when found in fields, but not so strikingly as those laid in no nest, or scarcely any, by sandpipers and plover, whose eggs are so assimilated to their surroundings that it often requires a very long search to detect them in a given space ten feet square. I have flushed the common "teeter" within a yard of me, and on hands and knees have hunted fifteen minutes before finding her treasures; they were among my earliest prizes, and, thankful not to have trodden on them, I unkindly took them all. But to the amateur there is no necessity of cruelty. You can become intimate with birds without shooting them, you can examine their nests without pulling them to pieces, and can contemplate their eggs without disturbing them, or, by acting judiciously, can gratify your love of possession without destroying a mother's happiness. Birds vary in their

tendencies to desert their young if meddled with; but often, after taking one or even two eggs from a nest, I have watched the quiet return of the parent, and the successful hatching of those left. The further that the stage of motherhood progresses, the more persevering feathered mothers become; but at all times persistent visiting or intrusion annoys them.

The appeal of a brave, affectionate bird, when brooding over her young, is very touching, but it is too often disregarded. Few persons know the trials of bird life. Many hundred times have I watched the smaller birds in spring during the course of their domestic life; and I remember but very few instances in which the parents seemingly had uninterrupted success from the beginning, when the foundations of their nurseries were laid, until all their young were reared. I distinctly recall only half a dozen cases. The parents' chief enemies are the weather, snakes (especially the black-snake), various other birds, such as crows, blue jays, crow blackbirds, and cuckoos, the tree-squirrels (but not the little striped ground-squirrel or "chipmunk"), and cats. The cat, while it is always a graceful and sometimes a useful animal, is, just in the proportion that it is a good mouser, also a skillful bird-catcher, and does much mischief on a country place.

The nests which one finds in fields and pastures on the ground are generally those of the sparrows. They are all much alike—slight hollows, protected or partly concealed by a bush, hummock, or clump of grass, and in most cases lined very neatly with hairs, though dry grass, etc., almost invariably enter into their composition. If taken up for preservation, they must be dug up with a little of the earth about them, as otherwise they fall to pieces. All nests are naturally in better condition for a collection when just finished, but fine specimens may often be obtained when vacated by the young, while a few are capable of withstanding exposure to weather for a considerable time. They should be taken with their immediate surroundings, whether branches, twigs, or earth, and handled very carefully. In the house, they should be repaired, if damaged, by stitching or gluing; should be kept free from dust, for if once dirty, they can not be cleaned without injury; and if partly composed of feathers or woolly matter, should be occasionally wetted with benzine.

Among the ground-nesting birds there are in Massachusetts no less than nine species of sparrows, some of which commonly make their homes in fields or pastures; I shall therefore enter into no details. But a curious fact, which illustrates the frequent departure from types or rules in nature, is that the common chipping sparrows, or "haw-birds," have been known to build on the

ground, though they usually build several feet above it, in a bush, hedge, tree, or vine.

There is little of interest to keep us in the hot fields on a warm day in the last week of May, and I pass on to the meadows. On their borders, in the fields where the longest grass grows, is a nest which you must hunt long for before finding—that of the bobolink. In the elm-tree is the jolly male, in his summer livery of black, buff, and white, and singing as if he could not contain himself. Still caroling, he spreads his wings and drops into the grass. We can not see from here what he is doing; he may be whispering to his plainly colored mate, or he may be feeding. Long before we are near enough to surprise him, could we do so under any circumstances, he springs up, and sings as if he asked us to stand and listen. Looking for his nest in this wide field is like searching for a needle in a haymow. Should the female suddenly rise within ten feet of us, she may have wandered from her eggs for a moment, finding her mate inattentive in providing her with food, or she may have tried to deceive us by stealing from them through the grass, and flying up at a distance; but no, she has staid at the post of danger until the last minute, 'twixt hope and fear, and springs up at our feet. There, in a little hollow, which has been warmly bedded, and over which the long grass waves, lie four grayish or greenish eggs, mottled with dark brown. Look at them quickly, and then let us go to the meadows.

As we splash through the wet places, and jump the ditches, a general chatter arises, and half a dozen blackbirds with brilliant red patches on their wings present themselves. These are the males; but there is a female, who leaves her nest every minute, returning immediately, and who betrays its position by her anxiety. She is plainly colored, streaked, and much smaller than the male. Her nest, in this hummock, happens to be cup-shaped, and carefully finished with fresh-looking bits of dry stalks and grasses. The eggs in it are pale blue, with dark spots and scrawls. I have said, in the last sentence, "happens to be" so and so, because, of other swamp blackbirds' nests in the same meadow, some are probably lined with rootlets, some with hairs, and others are built in bushes. If we extended our examination to other meadows in different localities, we should find great variety in positions, structure, and material. Some specimens from bushes are composed partly of sticks; others, from the sea-shore, are made chiefly from sea-wrack or eel-grass. Mr. Maynard describes one built in a tree, fifteen feet above the ground, and pensile like that of the golden robin or hang-bird. Not only do surrounding circumstances produce an effect every where, but individual birds vary in their architectural skill or care. Moreover,

work is often begun late, and, being hurried through, is done badly; on the other hand, leisure often causes nicety, and even unnecessary labor.

That refrain of plaintive whistles which we now hear comes from the meadow-lark in that tree; he has a bright yellow breast with a black crescent on it, and some white feathers in his tail. Now he leaves the tree, and flying across the meadow with quivering wings, drops into the grass; but his nest is probably in that dry patch where the land begins to slope back toward the farms. I can not undertake to say that we

plused by the caution and cunning of the architects. You will facilitate your work by scattering cotton-wool, horse-hairs, straws, string, worsted, and cloth where they will attract the attention of the birds about you. Put them on your lawn or on the piazza vines, and watch them. A robin comes to carry off the string, and having used up what you have provided, and liking the material, attacks a long piece wound round a stake, and supporting a gladiolus. By persistent effort he frees a part of it, but the harder that he pulls at the rest, the tighter he ties the knot around the stake, and the

GOLDEN-CROWNED WREN'S NEST.

shall find it by going there, for the meadow-lark's nest is usually hidden beneath an archway of the long, dry, and tangled meadow-grass. So completely is it often concealed, that you can find it only by frightening the sitting female suddenly, and making her fly up from the archway. Then, by exploring carefully, you may catch sight of the eggs, which are white, with brown and lilac spots. Were not the birds so common, I should not in all probability have been able to present you with a description of their retreats, or, if I could, should feel very proud of doing so at first-hand; and any beginner may justly take pride in discovering one of them. The best way to find nests is to watch a bird while building; in that way, moreover, you are sure to see them in their best condition, and to know when the eggs are fresh. It requires patience; but you see the workers return again and again to the same spot, and a little closer inspection usually completes your knowledge, though you may sometimes be deceived or non-

string is becoming entangled with his legs; he fights twenty minutes, and then gives it up. Sparrows pick up hairs and straws from the lawn, and warblers come to the vines for cotton-wool, passing fearlessly within three feet of your chair; then they come back to break off little twigs and to peel off shreds of dry bark from the honeysuckle. A pair of golden robins—the male with black and orange, the female with yellow and duller black—come for string, worsted, and thread; but beware of them, for they are thieves. Leave your knitting under the tree there for five minutes, and it is gone; you will find it a week later, a part irrevocably woven into the hanging nest, and a part dangling with the needle in it. The weaving is so cleverly done that you wonder whether the orioles haven't used your needles. Not at all, madam; I defy you to produce with your implements such a piece of work as these birds have produced with their bills. Successful experiments have been made by supplying

BLACK-THROATED GREEN WARBLER'S NEST.

the orioles, in the tree where they are occupied, with bright silks and worsteds, which they employ altogether, if liberally provided, so that a very gay and party-colored nest may swing in your orchard where you can see it from the house. Wilson says that an old lady, to whom he showed an oriole's nest in which a piece of dry grass, thirteen inches long, was passed through thirty-four times, asked him, half in earnest, if the birds couldn't be taught to darn stockings.

Let us go back to the meadows, and, leaving these, enter into the adjoining swamp, where I shall show you several objects worth seeing. We might find in this swamp nests of several species, but the ground is so wet and the brambles so thick that I will only show you two that I found just completed two or three days ago. We shall come to one by following this path along the brook-side. Of the warblers there are many who build on the ground in or near wet places, but only one of these is common, at least in a large part of the United States—the little Maryland yellow-throat. The male, who is eying us saucily from that thicket, is olive-green above, with more or less bright yellow beneath, and has a black patch which covers his forehead and the sides of his head, inclosing his eyes. You will often see him on road-sides. The female is duller above, paler be-

neath, and has no black. Her nest, a few steps further on, owes its attractions to the surroundings. Beside it is the brook, on which the sunlight plays, as it breaks through the bushes on the other side. Around it are grasses to conceal it, and behind it is a cluster of tall, graceful ferns. Behind the ferns is a young tree that spreads its branches over the whole. How much mysterious life is in the group, especially in those four little eggs lying together, all white, one unmarked, one spotted with brown, one speckled with lilac, and one marked with both! Such is the variety which we often find in one nest. In the nest of a hawk I have found two eggs, one almost pure white, and another buffy, with dark brown blotches. But the mother before us asks us to pass on, and to discuss these phenomena where she shall not be disturbed.

In that open spot, bathed in sunlight, on that knoll by the bushes, sits another bird on her eggs, her soft reddish-brown back in contrast to the surrounding green. It is the Wilson thrush. The little yellow-throat, when we intruded, hopped about us, expressing her anxiety openly; but the thrush disappears quietly into the bushes, disclosing behind her a very pretty picture. Her nest, made of dead leaves, strips of grape-vine bark, and dry grasses, and lined with a few hairs, is set in a bank of rich dark green moss; in it are four light blue eggs; above it is a little plant with bright red berries. All the colors in the picture are so strong and yet delicate, all the forms

YELLOW WARBLER'S NEST.

so graceful, that I am tempted to stand here gazing much longer than I ought. Birds' homes vary in attractiveness like those of men, and before leaving the swamp I will show you another Wilson thrush's nest. Here it is, set among the dead leaves, near the foot of a tree. I need hardly point out to you its comparison with the other; the situation is quite cheerless, and the nest is coarse. You may attribute this, as you please, to laziness, indifference, want of taste, inexperience, or to necessity and difficulties. The contrast is striking, and is one of the innumerable illustrations of the infinite variety in nature.

I shall now direct your steps toward a dry, hilly tract of low oaks, birches, and bushes, which is called the "scrub"—a place where but few years ago stood a forest of pines. There we are likely to find nests of only two kinds on the ground (unless we find one of the ruffed grouse), and of these the eggs are often very closely alike. The birds belonging to them are both about the size of the robin. The brown thrushes have long tails, and are bright reddish-brown above, and beneath white, with dark streaks on the breast. There is nothing remarkable in their nests, but the conduct of the females is often surprising, particularly when their nests are in bushes (being almost always on or near the ground), for these birds are peculiarly at home in shrubbery. Though habitually rather shy, yet they are sometimes very bold when sitting. More than one young collector must have had the experience of being a little frightened when, literally hissing, they have refused to leave their nest, and much startled when, on being attacked, they have flown at him with vehemence. Such conduct, however, is rare, and of course causes no danger. Mr. Allen mentions the nest of a brown thrush found in the West at an unusual height from the ground, because built beside a river which was often flooded suddenly and heavily. The bird or its ancestors profited by experience. This perhaps illustrates how types may be lost. If birds, for instance, of any species are driven by unfavorable changes into a tract of country with very uniform characteristics, they soon adapt their habits to their surroundings, perhaps losing marked traits. This question will be considered again, in reference to the swallows.

The towhee buntings, also called che-winks and ground-robins, do not behave like the brown thrushes, but usually conceal their nests. Sometimes a place is chosen where dead leaves and switches have accumulated, and either partly under the leaves, or actually in a pile of brush, the nest is built so as to escape all notice of the passer-by. At other times the nest may be found at the foot of some bush more openly

situated. Near it stays the black and white male, with patches of chestnut red on his sides, turning over the decayed vegetation about him, and uttering his characteristic "towhee," or perching in some bush to sing his simple song. If we disturb his mate, he will make his appearance immediately, and utter his saucy cries of distress. We will leave him and go to the woods.

In the pine grove we may find several pretty nests on the ground—among others, that of the little black and white creeper, with its delicately colored eggs. The one by far of most interest is that of the oven-bird, or wagtail. You at once ask, Why called "oven-bird?" You will better understand when I show you the nest which I have found, an exceptionally fine specimen. Here it is, among the dry pine needles at the foot of a little knoll. It is built on a slope, and is roofed. This sounds strangely; but overhanging it is a net-work of pine needles and dry grasses built out from the slope, and this roof gives it the appearance of an old-fashioned oven, at the same time concealing it on three sides. It is a wrong belief that the open side (when there is any roof) is always toward the south; it is as often toward the east; and convenience of situation apparently influences the builders as much as considerations of heat and light. Without me, I fear that you would not have seen this nest, even though you had stepped within six inches of it. As you came by, you would have seen a small bird, with greenish back and tail, and an orange crown bordered by dark stripes, fluttering along the ground. Half in eagerness and half in pity, you would have followed, as she led the way, always just out of reach. Suddenly she would have disappeared or flown off, and you would have thought her conduct strange until you realized that you had been fooled by a bird. Experience will soon teach you, when you suddenly see a bird before you in seeming pain and distress, not to pay her any attention, but to look about you, without wandering three feet from the spot where you first saw her. You will then find her nest, probably, unless she has stolen from it some distance before showing herself; then the case is quite hopeless. The partridge, or ruffed grouse, is another deceiver. To be sure, she leaves her nest under the log there, with its nine brown eggs, with an honest and startling whir; but when the proud mother is with her chicks, she is cunning enough to outwit many a man who thinks himself clever. The variety of her ruses makes them doubly successful. Sometimes when surprised she feigns lameness, and tries to decoy the intruder away; sometimes she bristles up, and attacks him by pecking at his toes, then suddenly flies off. In either case the young have the good sense or instinct to hide in

the grass or dead leaves about them until they hear the whining call of their mother, when they gather about her once more. The partridge is so earnest in her efforts to distract one's attention, and her chicks so nimble in hiding, that both are likely to escape, even from a person who takes no pity on their distress.

Among those nests which are supported beneath are to be included those built on cliffs by certain birds of prey, such as the eyries of the eagles, and several kinds connected with buildings, as that of the robin sometimes is. In the bird-boxes we may find those of the martins and white-breasted swallows, with white eggs, and sometimes those of the bluebirds, with light blue eggs.

Far more pleasing than all these is the pewee's (or Phæbe-bird's) nest, which is usually placed on top of a pillar on the piazza, on a beam of a shed or bridge, or on the outside of a barn. The last which I examined was a semicircle in its outward shape, and was attached to the wall of a carriage-house, on the beam over the door. Its walls were composed of grasses, straws, etc., cemented together with mud. Inside was horse-hair, one of the commonest materials in bird architecture. The outside was the most artistic part, being thickly coated with green mosses. Another nest on a neighboring pillar was circular, and, like the first, contained white eggs.

Of the first class, the remaining nests are built in trees or bushes; and here the range is so wide that I can only present a few typical specimens. Some are saddled to a bough, others are placed in a fork, and others in a crotch.* The materials are either simply upheld, are plastered to their supports, or are wound round them. The least artistic are the nests of sticks. Many hawks and owls build these more or less clumsily, and often rudely, in evergreens, where two or three branches leave the trunk together. Crows and blue jays build very similar structures, though much neater and more carefully lined, that of the blue jay being very much smaller, and placed nearer the ground. Both the fish-hawk and bald eagle usually build enormous nests, chiefly of sticks, in the top of a tree near water. They repair these year after year by adding to them, and often get together a large cart-load of stuff. In contrast to these, the cuckoos put together a few twigs in a bush, vine, or low tree, and often lay their eggs on a platform which seems almost too frail to support them. You can easily see the bluish eggs through the bottom. So indifferent are the cuckoos to architecture that I have known one to lay

her eggs on a cotton rag which was caught in the thorns of a barberry bush. Occasionally one builds a substantial and hollow structure for her young, but such cases are very rare.

The thrushes' nests have already been spoken of in earlier numbers of this Magazine; the robin's nest is the coarsest of them, though in substance a fair type of the others, built in trees, except that the others have a greater variety of material, and most often no mud. If you are not familiar with the robin's work, I can safely leave you to study it by yourself. You can easily find a specimen in some apple-tree which will show you what "plaster-saddling" is. The other method of saddling is exhibited very perfectly in the nest of the wood-pewee and that of the humming-bird. The latter is exquisite. Inside, its diameter or width is only about three-quarters of an inch, but it now holds two white eggs, and by-and-by must be the nursery for two young. Of its shape and immediate position you may judge by the accompanying picture. I have usually found it in an oak or orchard tree within fifteen feet of the ground. The walls are composed of the finest materials which the vegetable kingdom offers—down, silk from seed wrappers, and hair-like fibres; the coarsest among them are bits of sweet-fern. Outside, it is thickly coated with lichens, which the male sometimes amuses himself by putting on after the female has laid her eggs. It is very substantial. I have had photographed for the engraver a specimen which I found in March; it has suffered surprisingly little from nine months' exposure to weather. The protective resemblance to surroundings seen in the humming-bird's nest is better exemplified in that of the wood-pewee. This nest is much larger, though shallower in proportion to its diameter (of two or three inches). It is built in a grove on a moss-covered limb, and is so coated with lichens as to resemble exactly a knot or protuberance of the limb itself. I have seen some so ingeniously made that they could not be detected as nests from the ground when the birds were not on them. The eggs in these artistic structures are very pretty, being creamy or buff, with a few large spots of brown and lilac.

Nearly all our smaller birds, excluding the swallows, build a fresh nest every year. In doing so they spend from one day to a month, a week being the average time. In many ways it is unsatisfactory to watch them at work, it being almost impossible to obtain a position where you do not disturb the birds, but can see exactly how they use their materials. The females are generally the chief, and sometimes the sole workers. The beginning of their labors is the most puzzling part to us, and perhaps to them.

* By "saddled" I mean fastened to the back or upper part of a limb. A "fork," as the term is here used, is a horizontal division; a "crotch," the point where upward branches separate.

It is sometimes accomplished by laying sticks, twigs, or straws across from branch to branch; sometimes by placing a clump of material in the bottom of a crotch or in a fork, and at other times by winding strips of bark, fibres, etc., around the neighboring twigs. What is then added is pressed or twisted into position with the bill. The inward shape is preserved, and toward the end perfected by the breast as the female turns round and round. Materials are sometimes brought a mile, but ordinarily are gathered near their destination. It is very pretty to see warblers taking fresh caterpillars' silk from the new nests; but sometimes a rather ghastly effect is produced by the caterpillars themselves being carried off with their silk, and by their corpses being left to dangle about the nest for which they have been sacrificed. A majority of our smaller birds have four or five eggs in one set, sometimes having two or three different sets in one season, and lay them from day to day. The males usually undertake a part of the incubation, feed their sitting mates, and cheer them by singing, sometimes singing at night. Even males with such dangerously bright colors as the scarlet tanagers occasionally relieve their mates during the daytime. The common period of incubation is from ten days to a fortnight.

The homes of the tree-nesting finches and fly-catchers, those of the tanagers and waxwings, I must pass over. Those warblers who build in bushes and trees excel as architects, the last artistic production of theirs which I remember to have seen being very

HUMMING-BIRD'S NEST.

neatly made of pine needles, and lined with the black fibres of a moss. I have had two photographed for the engraver, one of the common yellow warbler (*Dendraeca aestiva*), built in the crotch of a barberry bush, and one of the black-throated green warbler (*D. virens*), placed in a fork near the end of a pine bough. Both were built near Boston, and were finished about the 1st of June. They are composed as follows: that of the summer yellow bird of slender shreds of grass and fibres mixed with silky and woolly materials, besides a few bits of fine string, the whole being lined with a rich dun-colored plant down; the black-throated green's, of strips of thin bark, small twigs and stalks, pine needles, a few feathers, and bits of paper, being lined with black and white hairs, and with hair-like fibres, which are glistening yellow.

Of the pensile nests, the commonest are those of the Baltimore orioles, or golden robins (also called "fire-birds" and "hang-nests"), whose long pouches, four to eight inches deep, you must have seen in an orchard-tree or in an elm, for to an observant person they are often conspicuous objects in a village street, or even in a city park. They are often placed near the end of long drooping boughs, and are not easily got at from beneath, while above they are commonly protected by a canopy of leaves. They are so common, and have been so frequently figured and described, that I shall not dwell upon them. They are variously made up of grasses, fibres, thread, wool, worsted, yarn, string, and even cloth. The nests of the vireos are much less well known. They are pensile, rather cup-shaped, from one to two inches deep, and two or three wide inside, and are usually suspended from a fork. The linings are never very soft, but are often coarse. The eggs are white generally, with a few brown spots

WHITE-EYED VIREO'S NEST.

or speckles about the larger end. The commonest, that of the red-eyed vireo, is built from five to twenty feet above the ground. It is sometimes ornamented outwardly, but two or three typical specimens before me consist merely of strips of bark, such as that from grape-vines, somewhat coated with insects' silk, and are lined with pine needles. A very pretty one is made of white birch bark, and another of greenish-gray tree-moss. In contrast to the typical forms just mentioned is the larger and substantial nest of the yellow-throated vireo, often found in the orchard, and profusely covered outside with mosses and lichens held together by silk. It is one of the finest specimens of bird architecture that we have. The white-eyed vireo (*Vireo noveboracensis*) builds near the ground, usually in a bush or sapling, and often in a very open spot. Sometimes its nest, like that of the red-eyed vireo, is largely made up of paper from wasps' nests, or of newspaper, whence both species have been called "politician-birds." A very fine specimen, found in a birch about two feet from the ground, is shown on page 96. It is composed of fine vegetable shreds, caterpillars' silk, cocoons, and bits of dead wood, ferns, and leaves. Some vireos allow you to pass under their nests, or stand near them, without exhibiting alarm, and if robbed, remain near the spot, coming within a foot or two of your person. One has been known to remain on her nest when it was carried off from the tree. I have sometimes put my hand on sitting birds. I regret that I have not enough space left to describe at length the pensile nests which are globular; those built by the marsh wrens, of rushes (or the like, and usually mud), among marsh reeds or meadow-grasses; and those built of hanging moss in evergreens by the little blue yellow-backed warblers. There is on page 92 an illustration of a nest very rarely found, that of the golden-crowned wren (*Regulus satrapa*). It is composed chiefly of hanging moss, but is warmly lined with feathers.

THE PROFESSOR'S VICTIM.

"THERE is a mystery in that woman's life," said the professor—"a mystery that when I do think upon, I get what you Americans call a crick in the brain."

"Yes, professor," I said, meekly, although I had never in my life heard an American use the expression. But the professor went into altogether different society from that in which I was allowed to mingle, and I dare say they had a language of their own. I was merely a dress-maker. To be sure, I had good customers, and as many as I could well get along with, so that I had no occasion to put out a sign. Miss Winthrop was so glad of this. She said she didn't know how she could board with me if I kept a

sign at the door. It was bad enough for her to know how hard I worked, and what a wretched life I led; it was enough for her to pity me; it would be unendurable if the whole neighborhood should be called upon to extend me their sympathy. I think Miss Winthrop was mistaken. I am confident there were many people in our vicinity who would have been glad to have fared no worse than I. But Miss Winthrop had peculiar views about labor. I never contradicted her. The professor and she were wrangling always and forever. They never agreed upon any subject. He was there almost every day of his life. Miss Winthrop was studying at the Institute; but she was not a very ardent student, and used to be at home the most of the time, so that when the professor got through at the college and conservatory, he came generally direct to the house. It would have seemed strange and sad not to have seen him at least once in the twenty-four hours.

I remember that day so well. I had been more than usually perplexed in cutting and fitting. The left side of Miss Van Coot had to be padded all the way up to the shoulder, and in some unaccountable way I had mistaken the left for the right, so that when she put on the basque, I should have laughed if I had not cried. I was nervous and worked out, I suppose; and as she stood there, poor creature! not knowing what a spectacle she was, it was all I could do to keep the tears from rolling down my cheeks.

"I shall have to take it all apart, Miss Van Coot," I said. "It will take me at least an hour. You might as well get through your shopping, and come back again."

She went off in her carriage, and I began to rip out the stitches. The morning was cloudy and overcast; and as I got near to the window to see, I could not help thinking what a miserable world it was, when all at once a big shadow loomed up beside me, and a familiar voice cried out:

"Who is it has made thee to weep? Give me their bones that I may crack them."

And then I fell to laughing. Suddenly the morning seemed to be bright and beautiful, the form of Miss Van Coot shapely enough, if only I would not be stupid, and mistake the right side for the left. As for the professor, he was like a demigod made out of flesh and blood—a great deal of fine wholesome flesh and gallons of splendid blood. I could not help thinking, in my sordid way, that the professor's tailor, whoever he might be, was a wondrous lucky man; for nobody but those whose trade it is to puzzle and design for the human anatomy can have the least idea of how fearfully and wonderfully we are made. The professor was resplendent in a new raiment of some soft gray material that suited well his fine complexion and ruddy hair. In his but-

ton-hole were some fresh violets, for it was already early spring. He pulled the gloves from his plump white hands, and went in to the piano. It was open, just as Miss Winthrop had left it.

"Will she return to luncheon?" he said, running his fingers over the keys; and I thought as he spoke how nice it was to be the one "she" in that big generous heart.

"Yes, professor," I replied.

"Then I will stay," he said, and immediately I went to prepare his favorite pudding; and while I stirred the materials together he came out into the kitchen to talk about Miss Winthrop. Never by any chance when we were alone together did he talk of any thing else.

"I saw your tears," he cried, in his tragic way. "Were they because of Miss Winthrop? I should not at all wonder. Of all women, she is the most aggravating, the most unreasonable—"

"It was not Miss Winthrop," I said; "and you do not think all these disagreeable things that you say of her."

"I do—I do," he cried. "You think, now, that I am what you Americans call 'spooney' about her; but it is not that at all. I have only the puerility to be curious;" and then the professor went on to tell me that the mystery in Miss Winthrop's life gave him a "crick in the brain."

"At times," said the professor, "she is moody. She is what the French call *distrain*—she is plunged into a melancholy profound and touching. I tell you, my gracious Fräulein, there is a burden upon that woman's soul. Now what can it be?"

I did not reply. How could I? I had also noticed these periods of sadness and abstraction upon Helen's part, but how could I speak my heart out to the professor? How could I tell him that he was unconsciously trifling with Helen, making her happy at one time, only to render her the more miserable at another; that this capricious conduct of his was the cause of Miss Winthrop's melancholy? I did not dare be thus frank with the professor, for fear that he would go straight to Helen and tell her. He was like a child in impulse, and many a time, when I had unwittingly trusted him, he had unblushingly betrayed me.

Fortunately, Miss Van Coot came in. The professor went into the parlor and began to bang upon the piano with the fervor of an enthusiast. While I was trying on Miss Van Coot's basque, he poured out his whole soul upon the keys, so that Miss Van Coot fidgeted from one foot to the other, and at last tore herself away from me and sank upon a chair near the door.

"Let the dress go," she said. "I must listen. Oh, how beautiful it is! Who is he? Where did he come from? How magnificently he plays! How do you manage

to have an instrument like that? The high notes are perfect;" and she peeped through the crack of the door.

"Pardon me," I said, respectfully, for she was the best customer I had, "but in ten minutes I shall be done. The basque fits you to perfection. He is Professor Wagner, of the Grand Conservatory. He does indeed play wonderfully well. The instrument is not mine; it belongs to the professor, and he has hired it to a young Southern lady who is boarding with me. She is a pupil of the professor's."

"A pupil!" said Miss Van Coot, who had given herself into my hands again, a warm color creeping into her murky skin, her dull eyes kindling. "Then he will teach?"

"Yes, if—if— He will teach *you*, if that is what you mean; of course he will. I only meant that the professor's terms are very high."

"So much the better," said Miss Van Coot.

It was really wonderful how well the basque fitted her. One would certainly have thought that her left side was the same as her right; and Miss Van Coot was so pleasant a lady, it would have been a thousand pities if she had not been able to afford to have a skillful dress-maker, one who made her work a continual study. I was really all of this. It is no egotism to mention it. I was quite famous in my line of business, and was particularly successful in hiding any little awkwardness or defect in shape or carriage. I began by feeling sorry for those who were afflicted in this way, and determined, as far as in me lay, to ameliorate these little disadvantages. And the professor never would have known of this inequality of Miss Van Coot's if he had not, so to speak, tortured it out of me that unlucky morning.

When I had quite finished, and had gone to the door with Miss Van Coot, it so happened that the professor also came into the corridor by the parlor way. "I shall walk out a little," he said to me, "until she returns." And at that moment he reached the top of the landing where stood my wealthy customer. Of course he lifted his hat from off his splendid ruddy hair, and bowed his handsome head, and waved his plump white hand for her to pass on before him. A lady was always honored with all this gesticulatory distinction by the professor, whosoever she might be. Miss Van Coot, with one eager, devouring look upon him, went on to her carriage, from which she looked again; but as for the professor, he went on his way unmindful, humming a little roundelay under his breath, and holding his head high in the air. But when he came back again, luncheon was not quite ready, Miss Winthrop had not come, and nothing would do but he must know why he had found those foolish tears in my eyes that morning.

"It was Miss Winthrop," he said. "You need not try to shield her. I know her, to my cost. She is arrogant; she is without heart; she has said that which has cut thee to the soul."

"Nonsense, professor," I said, quite off my guard. "It was only that I made a stupid mistake in Miss Van Coot's basque. She has to be padded all the way up the left shoulder."

"Gott in Himmel!" cried the professor; and then I saw my imprudence.

"It is nothing," I said, "when one can afford to have a skillful dress-maker."

But the professor leaned back in his chair and raised his hands to heaven. It was only natural that he should consider it a terrible misfortune—he whose physique was like that of the Apollo Belvedere.

"She has lots of money," I said.

"A silver mine will not buy her a new spine," said the professor.

"It will serve to make her own very presentable," I rejoined; "and, besides, she is so good and kind."

"Ah," he said, heaving a sigh from the bottom of his lungs, "that is better than all. She is honest, perhaps, and truthful. At least she will not, perhaps, lie, as you Americans say, as fast as the horse will trot. She will not promise to sit at your table at a certain hour, and then go away and give no further thought to the matter. There are some people whose spines may be all that is desirable, but their hearts, my gracious Fräulein, they are black to the core."

It was too bad that Helen did not come as she had promised. The professor did not fully get over his disappointment till he came to the pudding, which was fortunately as near perfection as a pudding can be.

His eyes grew less ferocious as he dallied with the flaky puffs, the fierce lines about his mouth gave way, a generous, benignant expression gradually beamed upon his face.

"And then," at last he said to me, "thou hast not only the spine without blemish, but the heart and the soul. Whatever thou undertakest to do, is done wisely and well. Gesegnete Mahlzeit, may the meal be blessed to thee! If thou wouldst be a saint in heaven, continue to be a good Hausfrau upon the earth."

Thanks to the pudding, he went upon his way rejoicing. When Helen came, it was soggy and ruined; but Helen was not very hard to please. A bit of toast, a poached egg, a morsel of any sort, particularly in the Lenten season, was all she would ask.

When I told her of the professor's displeasure, she laughed in that mocking, musical way of hers; but I thought there was a latent tenderness in its ring, and there was a melting look in her great black eyes, a tremulous sweetness about her mouth, that made me look at her again. She could wear

a Dolman with more grace than any one I ever saw; and just the little ruffle of cashmere lace about her neck, and the two creamy roses well down upon her hat, made her like some beautiful picture.

It was fully a fortnight before the professor came again to stay any time. He was very busy. Miss Van Coot had not only prevailed upon him to take her as a pupil, but he had consented to manage a *musical* for her at her house on the Avenue.

Miss Van Coot and the professor seemed to get on very well together. One morning that I went there to fit some trimmings upon the white corded silk I was making for her *musical*, I found the professor reading to her his translation of a tragedy from the German. Once in a while he would appeal to her judgment in the formation of a sentence, and although she would pause to criticise, she invariably agreed with his version in the end. So that he began to talk to me of Miss Van Coot as he had formerly of Helen.

And the night of the *musical*, to which I did not go—Miss Van Coot, in her kind way, invited me, but it was not expected that I would accept the invitation—that night Miss Van Coot looked very well indeed. I went to arrange her dress before the entertainment, and really Miss Van Coot looked almost handsome. The excitement had lighted up her heavy face, and although it was a risk, I never had better luck with any thing than I had with that corded silk polonaise. Miss Van Coot was so pleased with it that she was kind enough to send me home in her carriage, and the professor whispered, as he bade me good-by, "Thou hast done marvelously well; nobody would know but that her two sides were cast in the same mould." So that the professor seemed very well pleased with Miss Van Coot, and I feared more and more for my poor Helen's happiness. As the days went by, there seemed almost a spell upon her, and I would only have been too glad to have her make fun in her old way of some of the people about us, or hear her laugh, no matter how mockingly. The professor began vaguely to feel that she was changed, and watched her at times with a fretful curiosity, and again with touching tenderness. She began to be to him like a well-behaved child; she bore his sneers and revilings so meekly; she played to his order and sang for him without complaint the classical music which she professed to abominate; nor did she finish by galloping off into some extravaganza of her own. The professor became more and more uneasy and perplexed. He ceased to talk of Miss Van Coot. He tramped to and fro the length of the rooms, muttering to himself, sometimes turning impatiently upon his heel and walking out of the house.

One night they sat together, Helen and

the professor, in my pleasant parlor. The flat which I rented was next door to a big asylum up town, so that the grounds by which it was surrounded gave us the advantage of side windows, from which we could look over across the river. The full moon was climbing up into the sky; a few timid stars were faintly glowing there; the air had already the delicious languor of early summer; and Helen was beautiful. Her simple white robe of India muslin, with only some narrow Valenciennes on the flounces, had a better effect somehow than Miss Van Coot's new corded silk.

I was putting away the china in the middle closet, when the professor's fierce whisper reached me. His voice would only modify to a sort of muffled thunder or a piercing hiss.

"There is a mystery in your life," he said; "there is something weighing upon your heart. Tell me, then, what it is. I must—I will know."

To my surprise and alarm, I heard a stifled sob, a soft footstep, and in a moment Helen ran out to me.

"Tell him to go away," she said, putting her arms about me, and hiding her head upon my shoulder. "I can not stand it any longer. Tell him to go away."

She sobbed aloud, but held her head steadily down upon my shoulder, while her hands repulsed the professor, who endeavored to approach her. Scolding and soothing by turns, the poor professor was beside himself.

"Leave her for to-night," I said at last to him. "She will be better in the morning."

He endeavored once more to take her hand, was again repulsed, and picking up his hat, flinging his coat over his arm, he rushed down the stairs two at a time, and out of the house like a madman.

I got Helen to bed, and when I was about to leave her, she pulled me down to her and kissed me.

"You are a true lady, Susie," she said; "the truest I ever saw. You have no cruel curiosity. You mind your own business, dear, which is the very sublimest quality a human creature can possess."

What was my surprise in the morning to find Helen come out to breakfast with her bonnet on, wearing a neat travelling dress, and having the air of one who was about starting upon a journey!

"Don't be startled, Susie," she said; "I am going to the South. I am very unhappy, and I can stay here no longer; my trunk is already packed. You will find upon the card which I will give you my address in New Orleans. You have earned the right to my confidence, dear, and you shall have it. I will write to you."

How could I help being startled? I couldn't eat a morsel, but sat devouring with

my eyes that sweet, sad face which was to vanish so soon from me, perhaps forever.

"True to the last, Susie," she said, getting up from the table and straining me to her heart. "Not a word do you say, not a question do you ask. What a treasure of a woman you are! I verily believe there is not such another on the face of the earth."

Then she kissed me once more, put the card into my hand, and the carriage being at the door, her trunk was bumped down the stairs, and she and it whirled away in the twinkling of an eye.

I sat there stunned and stupefied I don't know how long, till I heard the professor's footsteps in the corridor. Even then I did not move, but called out to him to come when he rapped upon the door.

"I could not sleep," he began; "I have tossed and tumbled all the night through. I came early that I might find her. Where is she?"

"She is gone," I said.

"Gone!" he thundered. "To the Institute?"

"To the South—to New Orleans. It is all your fault," I cried. "You have broken her heart. She said she was so unhappy she could stay here no longer. She has gone; you will see her no more. You have lost her as well as I."

"Du lieber Gott!" cried the professor, and sank panting into a chair.

"Yes," I said, "it is your cruelty that has driven her away. She loved you."

"Did she say so?" said the professor, extending his hands to me piteously.

"Of course she didn't. How could she? You never gave her a chance. You were amusing yourself with Miss Van Coot. You did not care—"

"Allmächtiger!" roared the professor, who was only profane in his own language; "do not dare to say that! I *did* care. But there was a mystery that perplexed and troubled me. Why did she never speak of her family and friends? Why did she never tell of her early life? of the days which were past?"

"Because there was no necessity. It was nobody's business but her own."

"Bah!" cried the professor; "it was. It was your business and mine. I tell you there was something to be feared, to be dreaded. Saw you her hair, how it did curl and curl? And her skin was of that rich warm tint, like the pulp of a pomegranate. And her eyes—dost remember her eyes?"

"The most beautiful eyes!" I exclaimed.

"Yes, yes," said the professor; "but opaque. I tell you, my gracious Fräulein, there was a taint in her blood, a mingling of the African there."

"Professor Wagner!" I cried, indignantly.

"And I," he shouted—"I loved her! Gott in Himmel, of course I loved her! But my blood has come down to me through the cen-

turies pure and undefiled. It is all that I have to boast of."

"Miss Van Coot has even more," I broke in. "She has condescended to tell me of her magnificent origin. Go to Miss Van Coot, Professor Wagner. Her blood is, if thin, of stupendous antiquity. She has already in your country a cousin who owns a principality. Make haste to get her, before he comes to her or she goes to him, for they have a fashion of marrying cousins—"

"Which is bad for their spines," groaned the professor. Then he turned to me, and the tears were actually in his poor eyes. "Come," he said, "you are vexed with me, and it hurts me to the heart. I can not afford to lose your friendship, which has been dear to me for so long. I will do what you wish. You say that she loves me. The good God knows that I am tired of this suspense. Well, I will marry her, then. There, now, art thou appeased? I will go after her to New Orleans, and bring her back to you. I will bring her back as my wife, and the conflict will be over."

"Oh, will you, professor?" I said, holding out my hands to him in delight, for I thought it was generous of him, considering every thing, and I fairly yearned for my poor Helen's happiness and his own.

"Yes, the sacrifice is made," he said, and heaved a heavy sigh. "Now let us think of the arrangements. It will be better for the first year that we shall board with you. She will be happier, and so will I. Can you hire the suit of rooms above? They are vacant, I believe."

"Yes, and they are beautiful," I said, clasping my hands with joy.

"Very well, then; I will see that they are properly furnished. You must have a good servant; you must not have too much care."

"Care!" I echoed. "It will be a delight, a pleasure." And the professor flung off his coat. I poured out some coffee for him, and we began to eat breakfast, for I had not tasted a morsel, and was comforted enough now to feel hungry.

A fortnight after, the rooms were complete, and the professor was to leave for New Orleans the next day. He was coming to take supper with me and bid me good-by that night, as the steamer started very early in the morning. I had made every thing I could think of to please him, and put a few pansies in my hair. The table looked wonderfully inviting. It was about dusk, and I expected him every moment, when the janitor's little boy came running in to me with a letter. I saw it was in a strange, fine handwriting, and thought it was some new customer; but as I read it, my blood rushed to my heart, for it was from Helen, and ran thus:

"MY DEAR SUSIE,—I have only time to tell you I am the happiest creature in the world. All those months

I was with you I had left my heart with a young person down here, who is the son of an abolitionist and a Quaker. My father is a fire-eater, if you know what that means, my dear; but he could not swallow the big bonfire of love that blazed between that young Quaker and me, so he sent me to the North, that my share of it should be cooled by your climate. But, if you remember, I did not see much of the climate. I was almost always in your cozy parlor, where the birds sang and the flowers bloomed, and the dear professor was so much like my own Edward that I could almost fancy they were one and the same—the ruddy hair, the same eyes of flashing blue, and his thee and thou brought back to me the sweet Quaker dialect. He had but the one fault—of which thou must cure him, my dear—a womanish curiosity that thou altogether art happily free from. It at last drove me away. I came home, like the prodigal, and my father gave me my Edward, the more readily that he was the best match in the county, and my father, though a fire-eater, is poor. My best love to thee and the professor, and I am always thine own
HELEN."

As I finished the last line the professor's footstep was on the stair; and as the night was warm and the door open, in he came, and found me, cold and petrified, with this dreadful letter in my hand.

"What is it?" he said, snatching the letter. "It is from New Orleans. Is she dead?"

"No," I said; "she is married."

And the professor read every word of that cruel letter of Helen's. Then he wiped his streaming brow, and I bent my head submissively, expecting a volley of imprecations and laments; but he said not a word, and presently sank into a chair, and looked out upon the western sky. A fresh breeze blew aside the curtains and lifted the hair from his beautiful white forehead.

My tears fell fast and heavily. I was so sorry for him I thought my heart would break.

"Weep not, little one," at last he said. "I think I have been a fool: is it not so?"

"No, no, no!" I cried, going over to him, and kneeling down by his side. "Oh, can you ever forgive me? Indeed, indeed, I thought it was so. I thought she *must* love, she could not help but love, you."

He looked down upon me and smiled, and patted my little red hand with his white and tapering fingers.

"What is to be done now?" he said. "The altar is ready, but where is the victim? How can the sacrifice go on?"

"There is Miss Van Coot," I said, timidly, "if you could bring yourself to be satisfied with her. She has houses and lands, and thousands and thousands of dollars in her own right; and she is very wise and learned, and a wonderful musician."

"Hold!" cried the professor; "why should this great and mighty lady condescend to become the wife of a poor professor? Hast thou not sufficiently fostered my foolish vanity? And what would become of the rooms above, upon which I have expended my time, my money, and my brain? You will own that they will not suit the fancy of Miss Van Coot?"

"Oh, they are so beautiful!" I cried, my

tears falling faster than ever. "The paper is so bright, the carpets are so pretty, the pictures so charming! There is a little rocking-chair there that is the dearest and most comfortable little chair in the world."

"Then keep it thyself, mein Herzchen," he said, in that low tender growl of his; and I began to tremble without knowing why, for he had bent his handsome head to mine, and gathered my hands in his. "Be thyself the victim! Thou hast long been my sympathizer and comforter. When I look back and think, imbecile that I have been, of all that thou hast done for me, and the

little I have done for thee, it is, as you Americans would say, like the handle of a jug, all on one side. It is as you put the padding upon poor Miss Van Coot's shoulder that morning. Listen, little one, to my commands. Thou shalt make no more gowns except thine own; thou shalt keep no boarder but thy husband. Come to my heart, mein Liebchen!"

And as I nestled there, a flood of glory beamed in from the western sky. I did not speak; my heart was full; and I thought there could be no happiness more beyond hope, or joy, or thought, in God's paradise.

POPULAR EXPOSITION OF SOME SCIENTIFIC EXPERIMENTS.

PART IV.—THINGS THAT ARE INVISIBLE.

THE METHODS OF BRINGING PHANTOM IMPRESSIONS INTO VIEW.—THE PHOSPHORESCENCE OF DIAMONDS AND SOME OTHER BODIES.

THERE are some surfaces on which if a shadow falls, it can be brought into view a long time subsequently.

A belief in the existence of the carbuncle, a stone supposed to have the property of shining in the dark, appears to have been current from the very infancy of chemistry. It gave rise to many legends among the alchemists, and early travellers relate marvellous stories respecting self-shining mountains and gems. Thus it was said that the King of Pegu wore a carbuncle so brilliant that if any of his subjects looked upon him in the dark, his countenance seemed as though it was irradiated by the sun; and that in a certain part of North America there was a mountain which illuminated the country for many miles, and served by its rays to guide the Indians at night. The story seems to indicate that the locality of this wonder was somewhere in the western part of Pennsylvania. Mr. Boyle relates that a Governor of one of the American colonies imparted this fact to him at a time when he was charged with the superintendence of those important settlements, and that an expedition had been dispatched to ascertain the facts correctly. It saw the shining wonder from afar, but the light diminished as the place was approached, and becoming at length invisible, the locality could not be determined with certainty.

These legends had for some time been passing into discredit, when Vincenzo Cascariola, a cobbler of Bologna in Italy, who had abandoned the mending of shoes for the purpose of finding the philosopher's stone, discovered his celebrated phosphorus, the Bolognian stone, or, as it was then designated, sun-stone (*lapis solaris*). He had seduced himself into the expectation that a heavy mineral he had met with—barium sulphate—contained silver, and in an attempt to

melt out that precious metal was astonished to see that the burned substance shone like an ignited coal in the dark. This was in the year 1602.

Some time afterward a Saxon of the name of Baldwin conceived the idea of obtaining the soul of the world by distilling in a retort chalk which had been dissolved in aqua fortis. In this extraordinary pursuit accident led him to observe that the substance he was working with possessed the quality of shining in the dark after it had been exposed to the light of the sun. The alchemist Kunckel, who relates the incident, tells us with gravity how he stole a piece of this substance on the occasion of a visit he made to Baldwin one night when that adept was trying to make his phosphorus shine by the light absorbed from a candle, and also from its image reflected by a concave mirror. In consequence of this theft, Kunckel succeeded in discovering what the substance was, and made known the method of its preparation.

The special condition under which these preparations shine in the dark was very quickly detected. Isidore, of Seville, speaking of the "lightning-stone," says, "Si sub divo positus fuerit fulgorem rapit sidereum." That condition is previous exposure to light.

The discovery of the elementary substance now known as phosphorus drew the attention of the cultivators of natural science to this singular property, and under the names of sun-stones, light-magnets, noctilucas, etc., various shining bodies were introduced. But the first truly scientific examination of the subject was made by Boyle, on the occasion of observing that a certain diamond belonging to Mr. Clayton, and subsequently purchased by Charles II., emitted light in the dark. Though he does not seem to have been aware of it, the fact itself was not new, for the alchemist Albertus Magnus says, in the thirteenth century, that he had seen a diamond which glowed when it was put into warm water. A diamond rubbed upon gold becomes beautifully luminous; as Bernouilli remarks, it

shines like a burning coal excited by the bellows.

The chief points ascertained by Boyle respecting the diamond were that it shone by friction with various bodies, and at the same time displayed electrical development; that it also glowed when warmed by a candle, the fire, a hot iron, or even when placed on the skin. Under the latter circumstances it exhibited no electricity, being unable to attract a hair held near to it. He also found that it would shine under water, various acid or alkaline liquids, or when covered with saliva, and that the glow was increased when the gem was put into hot water.

These results led to the conclusion that though under certain circumstances the light was accompanied by electrical development, as when friction had been used, there was no necessary connection between the two properties. The gem would shine without the least trace of attractive power.

Among substances endowed with this property, one of the best was discovered about a century ago by Canton. Still known as Canton's phosphorus, it is easily made by burning oyster shells in an open fire until they have become white; then, having pulverized them with about a quarter of their weight of flowers of sulphur, they are once more brought to a dull red heat in a crucible. This completes the preparation. A convenient mode of using the substance is to provide a piece of tin plate two or three inches square, brush over one side of it with gum or glue water, then dust upon it from a fine sieve some of the powdered phosphorus. In this manner a uniform white surface is procured, well adapted for experiments.

If on such a surface a key or other opaque object be laid, and it then be exposed for a moment to daylight, on carrying it into a dark room and removing the key, a spectral shadow will be seen, depicted in black, and its contour marked out by the brilliantly glowing phosphorus surrounding it. After continuing to shine for some minutes, the light gradually fades, and finally becomes extinct. If, this having been accomplished, the phosphorized plate be put away in a box or drawer where not a ray of light can reach it, and kept therein for days or even weeks, on exposing it in a dark room, on a plate of warm metal, the phantom shadow will emerge, perhaps even more strongly than at first.

A wonderful experiment, truly. Shadows, then, are not such fleeting, such fugitive things as poets say. They may bury themselves in stony substances, and be made to come forth at our pleasure.

The persistence of such surface phantoms may be strikingly illustrated by a simple experiment in which light is not concerned. If on a cold polished metal, as a new razor,

an object such as a small coin be laid, and the metal be then breathed upon, and when the moisture has had time to disappear, the coin be thrown off, though now the most critical inspection of the polished surface can discover no trace of any form, if we breathe once more upon it a spectral image of the coin comes plainly into view. And this may be done again and again. Nay, more, if the razor be put carefully aside where nothing can deteriorate its surface, and be so kept for many months, on breathing again upon it the shadowy form emerges.

Early in the last century two hypotheses were introduced for the explanation of the various cases of phosphorescence:

1. That phosphorescent bodies act like sponges to light, absorbing it, and retaining it by so feeble a power that very trivial causes suffice for its extrication. This was the view of Lémery, and was published in 1709.

2. That phosphorescence arises from an actual combustion taking place in the sulphureous parts of the glowing body. It is to be remembered that sulphur figured largely in the chemistry of those days. This was the hypothesis of Du Fay.

To this celebrated electrician we owe a very able investigation of the phosphorescence of various bodies, and especially of the diamond. He recognized the fact, overlooked by Boyle, that the gem must first be exposed to the light; and then, when taken into a dark place, it shines for a time, the light gradually fading away. But the glow can be re-established by raising the temperature, and an exposure of a single second to the sun is quite enough to commence the process.

To recognize feeble degrees of luminosity, it is necessary for the observer to remain in the dark until the pupil of the eye is quite dilated, and the impression of light to which the retina has been exposed is worn off. Du Fay gives a singular but very serviceable practical process. He recommends the experimenter to keep one eye bound up or closed for the purpose of observing in the dark, and to use the other in conducting his processes in the light. He remarks the curious fact that the eye which has been shut will not have the delicacy of its indications affected by that which has been exposed to the light.

In this manner Du Fay found that of four hundred yellow diamonds all were phosphorescent; but some that were white, or rose-colored, or blue, or green, were not. Nor was there any external indication by which it could be told whether any given one of these kinds would shine. He discovered, too, that the glow took place under various colored media, as stained glass, water, milk, but not under ink. He also made attempts

to compel the gem to preserve its light by enveloping it in opaque media, such as ink, black wax, etc., under the idea that the light could not get out, and concluded that he had partially succeeded, because in some instances the diamonds would shine after being so shut up for six or twelve hours. He verified Boyle's fact on the effects of hot water and heating generally, and carried his temperatures to far higher degrees, even above a white heat, finding that the stone had lost none of its qualities, for it would take light again when it was cold on a momentary exposure to the sun. He also investigated how far the glow was connected with electrical relations, and showed its perfect independence. He also greatly increased the list of phosphori, asserting that, so far from the quality being a peculiarity of the Bolognian stone, Baldwin's compound, the diamond, all solid substances except the metals, are phosphorescent when properly treated.

There is one point upon which Du Fay dwells that deserves more than a passing remark—the connection between phosphorescence and temperature. He proved that phosphori can not absorb light so well when they are warm as when they are cold, and that a rise of temperature always makes them disengage their light.

It is not my intention to relate in this paper the discoveries made by other experimenters in phosphorescence in the last century, or by Heinrich, the Becquerels, Biot, Poggendorff, Pearsall, and Ozann in this. I shall restrict myself to a narrative of my own contributions to the subject.

Respecting the phosphorescence of diamonds, I have recently had an opportunity of making a curious observation. A lady, a relative of mine, has a pair of ear-rings in which are set two large and beautiful gems, both of which phosphoresce after exposure to an electrical spark; she has also another pair in which both the diamonds in like manner phosphoresce. Judging from these four instances, one might regard this property as very common. Curiously enough, the necklace belonging to this set, containing thirty-eight stones of very fine water, has only one that will phosphoresce. This necklace would, therefore, lead us to reverse the conclusion to which the ear-rings had led us, and to infer that phosphorescing diamonds are comparatively rare.

We may, by making a judicious selection of the bodies which are to serve as our means of experiment, disembarass the inquiry of many of its complications. If we employ the Bolognian stone (barium sulphide) or Canton's phosphorus (calcium sulphide), or, indeed, any other substance liable to undergo chemical changes in the air, we introduce unnecessary phenomena, and can not

distinctly prove whether the shining is due to a direct combustion of the parts or to other causes.

Among selections that might be made, diamond and fluor-spar possess qualities rendering them very eligible for these purposes—unchangeability in the air and under water. Even between these there is a choice, for fluor-spar possesses all the good qualities of diamond. It might be said, considering the chemical relationships of diamond, that when it glows it undergoes a kind of surface combustion; but though direct experiments prove that this is not the case, it is much better to resort to fluor-spar, which is free from such an objection. It is absolutely incombustible. Besides, it can be obtained perfectly transparent or nearly opaque; it occurs of many tints of color; can be easily cut and polished. Its phosphorescent powers are very high; indeed, it yields, when properly treated, to no other substance, not even to Canton's phosphorus.

The specimens of fluor-spar employed by me were derived from many different sources, American and European. The color of the light they emitted was in some cases blue, in some green, in some yellow. Among them was an American variety of chlorophane of a pale flesh-colored aspect, translucent on the edges, and excelling all the others in the splendor of its light. It equaled the best Canton's phosphorus in power, yielding a superb emerald-green light when it received the rays of the sun or of an electric spark.

To what cause are we to attribute phosphorescence? What are the changes taking place in the glowing body?

We have already seen that more than a century ago two different answers had been given to these questions. Lémery supposed that bodies act toward light as they do toward heat, absorbing it, and then giving it out; Du Fay, that all phosphorescences are cases of combustion.

Before we can reach a decision there are evidently many preliminary points to be settled. If chemical changes between the glowing body and the air are disposed of, and the action is recognized to be of a purely physical or molecular kind, it is necessary to determine (1) whether there is any expansion or contraction of the shining body during its glow; (2) whether there is any structural change; (3) whether there is any evolution of heat along with the light; or (4) any development of electricity.

1. *Is there any change of volume in a phosphorescent body during its glow?*

A glass tube about two inches long and three-quarters of an inch in diameter was closed at its upper end by means of a plate of polished quartz, cemented air-tight. Immediately beneath the quartz the phosphor-

escent body was supported. Through a cork which closed the other end of the tube there passed a piece of thermometer tube bent on one side, and to it was affixed a scale. The arrangement was supported on a suitable stand, so that the quartz was uppermost, and at a little distance above it the spark from a Leyden-jar could be passed between a pair of stout iron wires maintained at an invariable distance, and thus produce phosphorescence in the body. It may be remarked that these effects of an electric spark do not take place well through glass, and hence a plate of quartz, which readily transmits them, must be used.

In Fig. 1, *a a* is the glass tube; *b b*, the plate of polished quartz; *c*, the phosphorescent body; *d d*, the cork closing the lower end of the tube; *e e*, the bent tube; *f*, its scale; *g g*, the iron wires connected with a Leyden-jar, and giving a spark. The index drop at *h* refers not to this, but to a subsequent experiment.

The large tube containing the phosphorescent body must be filled quite full of water, free from air, as also must be the thermometer tube to a given mark on its scale.

If an electric spark be now passed between the wires to make the phosphorus shine, it is clear that if there be any expansion or contraction of its volume, there will be a corresponding movement in the water of the thermometer tube.

On making the trial, and using in succession a crystal of violet-colored fluor-spar, a piece of flesh-colored chlorophane, and a mass of Canton's phosphorus, the result in all cases was negative; for, though these different substances glowed very brilliantly as soon as the spark passed, there was not the smallest movement perceptible in the index liquid of the thermometer tube.

With a view of estimating the delicacy of the means thus used for determining any change in the volume of the spar, the solid content of a piece of chlorophane was determined by weighing in water; also the value of each division of the scale was ascertained. The value of each such division was equal to $\frac{1}{1200}$ of the volume of the spar, and a movement equal to one-tenth of that value could have been detected.

It may therefore be concluded that a phosphorescent body, when at its maximum of glow, has not changed its volume perceptibly.

The conclusion thus arrived at is strengthened

by another mode of experiment. If change of volume be connected with this evolution of light, it might reasonably be expected that a sudden, severe, but equable compression, exerted on a piece of spar, the light of which is just fading out, would compel it to regain a portion of its brilliancy. A piece of chlorophane in that condition was placed in water contained in the apparatus known as Oersted's instrument for proving the compressibility of water, and which is described in most of the treatises on physics; but though, by suitably turning the screw, pressures varying from one to four atmospheres were suddenly put on the spar and as suddenly removed, no change whatever was seen in the glowing mass, the light of which continued steadily to die away.

In Fig. 2, Oersted's instrument for proving the compressibility of water, *a a* is the glass cylinder filled with water; *b*, the pressure screw; *c*, the phosphorescent spar or substance.

These experiments have a bearing on L  mery's theory. A mass of iron suddenly compressed grows hot; so, too, does atmospheric air. It would, therefore, not be unreasonable to expect that if a phosphorus acted like a sponge to light, and were thus pressed upon, it would yield up its light. But conceptions derived from the old theories of specific heat are perhaps scarcely applicable here.

When unequal pressure is applied, the result is different. A piece of chlorophane pressed by a forceps glows brightly; if crushed, the fragments sparkle like little fire-works as they fly through the air. If the spar be previously powdered, a shining is still produced, and when the pulverization is conducted in an agate mortar in the dark, bright eddies of light follow the track of the pestle. In these cases, however, the separation of the laminae of the crystal and the heat produced by friction probably determine the result. Canton's phosphorus did not shine when compressed or submitted to friction.

2. Does any structural change accompany the phosphorescence of bodies?

A flat piece of fluor-spar, polished on both sides, was placed in a polariscope, and a pair of blunt iron wires connected with a Leyden-jar were adjusted near the front of it, so that when the spark passed, a brilliant glow arose in the spar, which was at once viewed through the analyzer of the instrument. But though the experiments were made both by daylight and lamp-light, no kind of effect could be detected. Had any molecular change occurred, it could not have escaped notice.

FIG. 1.

FIG. 2.

FIG. 3.

In Fig. 3, *a b* is the polariscope; *c*, the flat piece of fluor-spar; *b*, the analyzer; *d d*, the iron wires conveying the electric spark.

These experiments were first made by using as the analyzer a doubly refracting achromatic prism; they were, however, repeated with a Nicol, in which the eye is not disturbed by a bright image as in the other case. Having fixed the plate of polished fluor in the polariscope, it was readily perceived that it possessed naturally a structural arrangement, for there were cloudy spaces or lines in it which contrasted with the faint white light passing in the adjacent parts. It was also seen that this structural arrangement could be deranged in a transient manner, either by pressure or an unequal warming, as is well known of other bodies; but when a powerful electric discharge was passed near the spar, and a brilliant phosphorescence took place, no impression could be detected. Even when the iron wires rested on the spar, and the explosion passed over its surface, nothing was perceptible except along the line between the ends of the wires, where the surface was roughened or abraded by the force of the discharge.

But though these experiments with polarized light give a negative result, or, at all events, prove that a phosphorus when shining has its molecular condition so little disturbed that the change can not be detected in this way, there can be no doubt that if the means of testing were more delicate, such a change would be discovered, for many years ago Mr. Pearsall found that specimens of fluor, not possessing phosphorescence naturally, might have that quality communicated to them by repeated exposure to many powerful electric discharges, which also gave rise to a change in their natural color. Now there can be no doubt that such an alteration of tint implies an alteration of structure.

Besides the test by polarized light, there is another which may be resorted to for the detection of structural changes when they are merely superficial; it is the mode in which various vapors will condense. I described several such cases in the *Philosoph-*

ical Magazine for September, 1840, some time previously to the publications on the subject that were made by M. Moser. They were brought forward at that time as an illustration of the manner in which mercurial vapors condense on a daguerreotype plate and develop images which it has received. Proceeding on this principle, a large plate of fluor-spar, the surface of which was finely polished, was made to phosphoresce brightly along a given line determined by the ends of two iron wires, which served as a discharger for a Leyden spark, and were placed near to the polished surface. The spar was forthwith suspended in the mercurial box of a daguerreotype apparatus and kept there an hour. The mercury condensed upon it faintly in the manner it would have done on a daguerreotype plate, especially on and in the vicinity of those parts that were more immediately exposed to the spark. This, therefore, seems to prove that there is in these cases a molecular modification of the shining surface.

3. *When a phosphorescent body glows, does it likewise emit heat?*

A very thin bulb, half an inch in diameter, was blown on a piece of thermometer tube, and after being washed over with gum-water, finely powdered chlorophane was dusted on until it was neatly coated all over. A drop of water was then introduced into the tube to serve as an index. Although the instrument was very sensitive to heat, when the chlorophane was made to shine and emit a gorgeous emerald-green light by the passage of a powerful electric spark near it, no movement whatever of the index ensued. From this it would appear that the quantity of heat developed by phosphorescence must be very small.

FIG. 4.

In Fig. 4, *a a* is the glass bulb covered with a coating of powdered chlorophane; *b*, a drop of water serving as an index.

A modification of this experiment, which, appeared to offer several advantages, was tried. The instrument represented in Fig. 1 was emptied of its water, and a single drop, *h*, put into the index tube. It was supposed that when the rays of the electric spark passed through the quartz and made the phosphorus shine, the air contained in the tube, warmed thereby, would expand, and a movement in the index liquid of the thermometer tube take place. But in several trials, in which different bodies—chlorophane, Canton's phosphorus, etc.—were employed, the results were uniformly negative;

for though these different substances glowed splendidly as soon as the spark passed, there was not the slightest rise of temperature perceptible.

A further attempt was made as follows: The disk of quartz being removed and replaced by a cork, through which a pair of iron wires to serve as a discharger passed air-tight, and descended to within a short distance of the phosphorus, sufficient time was allowed in various repetitions for the index liquid to come to rest. It was hoped that this form of experiment would have advantages over the preceding, because the discharging wires could be brought nearer to the phosphorus, and the effect take place without the intervention of the quartz. When the spark was made to pass, there was a great movement in the index tube, as in the instrument known as Kennersley's electrometer, but the liquid immediately returned to within a short distance of its first place; then a slow dilatation occurred, as though the air was gradually warming. Thus in one experiment the liquid stood at 24° , after the explosion it returned to 26° , and then there was a gradual dilatation to 32° .

To eliminate the various disturbing causes in this experiment, it was repeated many times, the spar being alternately introduced into the glass tube, and alternately removed. It was found that whenever the spar was present the gradual dilatation alluded to took place; but when the spar was not in the tube, instead of a dilatation, there was a gradual contraction until the index liquid recovered its original position.

From this it appears that *with the evolution of light there is a feeble extrication of heat.*

The quantities of heat thus liberated are so small, and the causes of error are so numerous, that I endeavored by other methods to obtain more trustworthy results. Thus I attempted to determine the surface temperature of a flat piece of chlorophane while phosphorescing, by means of the thermo-electric multiplier. The thermo-pile was placed in a vertical position, and the spar having been attached to a piece of wood, which served as a handle, intense phosphorescence was communicated by a Leyden spark, and the flat and shining surface instantly put on the upper face of the pile. But there was no movement of the astatic needles.

Then, taking the stone by its handle, it was touched with the tip of the finger for one second, and quickly placed on the pile. A prompt movement of the needles, amounting to four degrees, ensued. These experiments were repeatedly tried, and the results were uniformly the same.

It is to be inferred, therefore, that the quantity of heat set free during phosphorescence is very small, and that the surface of the chlorophane does not change its temperature by one-fourth of a degree; for had

it done so, the multiplier would have instantly detected it.

FIG. 5.

In Fig. 5, *a a* is the thermo-electric pile; *b b*, the plate of chlorophane; *c*, the handle.

4. *Is phosphorescence accompanied with a development of electricity?*

It has been stated already that the experimenters of the last century paid a good deal of attention to this point. Du Fay established the fact that though in many cases of phosphorescence there is a development of electricity, there are many others in which the light seems to be wholly unattended by any disturbance of that kind.

I have repeated some of these experiments, and with the same result, proper care being taken to avoid friction and other obvious causes of electrical excitement. Thus a flat piece of chlorophane, phosphorescing powerfully, was put on the cap of a very delicate gold-leaf electroscope, but no disturbance whatever was perceptible.

A large crystal of fluor-spar was made to phosphoresce brilliantly along a line about half an inch in length by passing the spark of a Leyden-jar between two blunt iron wires, the ends of which were that distance apart, and resting on the face of the crystal. Over this line of blue light, which was pretty sharply marked, and which lasted for several minutes, a fine hair was held. This would have been readily attracted and repelled by the feeblest excitation on sealing-wax, but in this case it wholly failed to yield any indication whatsoever.

In connection with the foregoing experiments, I may mention some miscellaneous facts. Some attempts were made to determine whether phosphorescent bodies in the field of a powerful electro-magnet would exhibit any change of property. Six Grove's

pairs were caused to magnetize a good electro-magnet; the power they could give to it would enable the keeper to support about half a ton. Between its polar pieces chlorophane, Canton's phosphorus, etc., which were made to glow by exposure to a Leyden spark, were placed. But it made no difference in the light whether the magnetism was on or not.

Phosphorescence is not communicable from one body to another. Having provided two polished plates of fluor-spar, one of them was made to glow by an electric spark, and the other was immediately put upon it. No communication of phosphorescence took place; the second piece remained perfectly dark.

Some authors state that fluor-spar does not become phosphorescent by exposure to the sun; but this remark does not apply to all varieties of it. Thus some chlorophane, which had been ignited in a glass tube till it had ceased to shine, was pulverized and again ignited in a platinum crucible. It emitted an emerald light. A slip of wood was now put on it to screen a part of its surface, and it was exposed to the sun for a few minutes. On ignition, it shone again finely, with a green light, the shadow of the wood being beautifully depicted. The same having been repeated a great many times, it appeared that the phosphorescence at last began to decrease, perhaps by frequent ignition causing a change.

A screen of yellow glass intervening between the sun and some powdered chlorophane prevented phosphorescence, but it took place through a plate of polished fluor-spar. When the light of an electric spark was used instead of the sunshine in this experiment, the fluor-spar prevented phosphorescence.

Determination of the absolute Quantity of Light emitted by Phosphori.—The first attempts I made for this purpose were conducted on the principle of comparing the stains formed on a daguerreotype plate by the phosphorus under trial, and by an oil lamp, receiving the rays from each on a concave metallic mirror eight inches in diameter and fifteen in focus. There were set, side by side, a small oil lamp, a piece of white paper illuminated by the lamp, and a fragment of chlorophane, arranging things in such a manner that the chlorophane might be illuminated by rays coming from a contact breaker worked by two Grove's pairs. The contact breaker was kept in action fifteen minutes,

and then, to prove the sensitiveness of the plate, the lamp was moved for one minute to a new position, and the experiment closed.

On developing, it was found that the impressions of the lamp had solarized, both that of fifteen minutes and that of one, proving that such a light in one minute is amply sufficient to change the plate to its maximum. Also the electric spark of the contact breaker was solarized, and the image of the piece of white paper beautifully given of a clear white; but the phosphorescing spar had made no impression, except from one portion where it had reflected the rays of the spark.

This experiment was repeated, using, instead of the contact breaker, a Leyden-jar; the result was the same.

FIG. 6.

In Fig. 6, *a* is the oil lamp; *b*, the white paper; *c*, the chlorophane, cut and polished; *d*, the contact breaker with its wires; *f f*, the concave mirror. Its concavity faces the above-named objects, and reflects their images inverted and reversed on a sensitive plate, *e*. The mirror and sensitive plate are inclosed in a darkened box not shown in the figure.

Estimated, therefore, by the chemical effects they can produce, the light from chlorophane is incomparably less intense than that from a common lamp.

As the foregoing attempt to obtain photographic effects had failed, I varied the experiment as follows: In a Bohemian glass tube a quantity of chlorophane in coarse fragments was placed, sufficient to occupy about three inches in length of the tube. The reflecting camera with its sensitive silver plate was set in a proper position. When every thing was arranged, a spirit-lamp was applied to the chlorophane, which soon emitted a superb emerald light, and continued to do so for about two minutes. An oil lamp was then placed in front of the camera for five seconds. On developing, the image of the lamp flame came out, but no trace whatever of the chlorophane could be detected. Thus it appears that the splendid green light emitted when the spar is heated is at least twenty-four times less intense than the light emitted by a small oil flame.

But as it is known that green light is not very efficient in changing a photographic silver surface, I made trial of the optical method of Bouguery, described in the first of these papers. The particulars of this experiment may be found in the original memoir in the *Philosophical Magazine*, February, 1851. Its result was that *the intrinsic brilliancy of phosphori is very small; a fine specimen of chlorophane, at its maximum of brightness, yields a light three thousand times less intense than the flame of a very small oil lamp.*

How could we, then, expect to measure the heat of phosphorescence? The radiant heat of the little oil lamp here employed at such distances would require a very delicate thermometer to detect it. Is it likely, then, that we could detect that of a source three thousand times less intense?

The Effects of Heat on Phosphorescence.—It has been already observed that the effect of heat in promoting the disengagement of light is an old discovery. Albertus Magnus remarked it in the case of a diamond plunged into hot water.

I found that if a yellow diamond placed upon ice be submitted to the sun, and then brought into a dark room the temperature of which is 60° , for a time there is a glow, but presently the light dies out. If the diamond be now put into water at 100° , it shines again, and again its light dies away. If next it be removed from that water and suffered to cool, and then be re-immersed, it will not shine again; but if the water be heated to 200° , and the diamond be dropped into it, again it glows, and again its light dies away.

The connection between phosphorescence and temperature may be instructively illustrated as follows:

Suppose that three yellow diamonds, *a*, *b*, *c*, have been simultaneously exposed to the sun, *a* being kept at 32° , *b* at 60° , *c* at 100° , and that they are then simultaneously removed to a bath of water at 100° in a dark room; it will be found that *a* emits a bright light, *b* shines more feebly, and *c* scarcely at all. From this it appears that *the quantity of light a substance can retain is inversely as its temperature.*

This principle furnishes the explanation of a multitude of facts. Thus Du Fay discovered that the Bolognian stone shines brighter when exposed to the sky than to the sun. In the latter case the temperature rises, and the quantity of light retained is less. Under violet and other glasses, stained with such colors as impede the warming effect, phosphorescence is even more vivid than when no glass has intervened. On the same principle we have an explanation of Du Fay's apparently successful attempt to prevent the escape of light from diamonds by putting them in ink or covering them

with black wax. When removed from the ink and brought into the air, they became somewhat warmer—perhaps the touch of the finger aided the effect—and a corresponding quantity of light was set free.

But though temperature is a controlling, it is not the only, condition involved. If it were, phosphorescence after insolation should occur only after a rise of temperature. The fundamental fact of the whole inquiry proves to us that a glowing body can retain more light in presence of a lucid surface than it can in the dark.

Is not this fact analogous to what we meet with in the exchanges of heat? A substance can retain more heat in presence of a hot body than a cold one. The brilliancy and quantity of light to which a phosphorus is exposed goes very far to determine the intensity of the subsequent glow. Thus I found that a piece of chlorophane exposed to one spark of a contact breaker shone feebly, but if it had received one hundred sparks, its light was very vivid; and it has long been known that in delicate phosphori a certain degree of luminosity can be communicated by the moonbeams, a more intense one by lamp-light, and one still more brilliant by the sunshine or a Leyden spark. This, therefore, leads to the conclusion that *the quantity of light a phosphorus can receive is directly as the intensity and quantity of light to which it has been exposed.*

With respect to the moonbeams, I have succeeded in obtaining an image of that satellite on Canton's phosphorus, by the aid of a concave metallic mirror.

The various facts herein cited indicate that when a ray of light falls on a surface, it throws the particles thereof into vibration. An examination of the action of the differently colored rays dispersed by a prism shows that in general the greater the frequency of vibration of the impinging ray, the more brilliant is the phosphorescence.

We may, therefore, in the explanation of phosphorescence, abandon expressions derived from the material theory of light, and assume that whenever a radiation falls upon any surface, it throws the particles thereof into a state of vibration, just as in the experiment of Fracaster, in which a stretched string is made to vibrate in sympathy with a distant sound, and yield harmonics, and form nodes. Such a view includes at once the facts of the radiation of heat and the theory of calorific exchanges; it also offers an explanation of the connection of the atomic weights of bodies and their specific heats. It suggests that all cases of decomposition of compound molecules under the influence of a radiation are owing to a want of consentaneousness in the vibrations of the impinging ray and those of the molecular group, which, unable to maintain itself, is broken down under the periodic impulses

it is receiving into other groups, which can vibrate along with the ray.

If a hot body, *a*, be placed in presence of a cold body, *b*, the theory of the exchanges of heat teaches that the temperature of the latter will steadily rise until equilibrium between the two takes place. The molecules of *a* communicate their vibratory movement to the ether, and this in its turn imparts an analogous movement to the molecules of *b*. For, as the ethereal medium is of vastly less density than the vibrating molecules, each of these oscillations will produce in it a determinate wave, which is propagated through it according to the ordinary laws of undulations, in such a way that the ether would be in repose after the wave had passed, were it not for the recurrence of the continuing vibration of the molecules. At each vibration the molecules of *a* lose a part of their *vis viva*, by the quantity they have communicated to the ethereal wave, the intensity or amplitude of the wave becoming less and less as this abstraction of force is going on. But the ether being of uniform density and elasticity throughout, each of its particles communicates the whole *vis viva* it has received to the next adjacent, and would instantly come to rest were it not again disturbed by the vibrations of the material molecules. These elementary considerations show how it is that a wave of sound passes through the air, or of light through the ether, and the particles of those media come instantly to rest; but a hot body or a vibrating string persists in its motions, which only undergo a gradual decline. If the vibrating molecule was in a medium of the same density, it would impart to it all its motion at once, and in the same way that a heavy molecule gradually communicates its motion to the ether, so in its turn does the ether to other systems of molecules.

Upon these principles we may explain the phenomena of phosphorescence. From a shining body undulations are propagated in the ether, and these, impinging on a phosphorescent surface, throw its molecules into a vibratory movement. These in their turn impress on the ether undulations; but by reason of the difference of its density compared with that of the molecules, they do not lose their motion at once; it continues for a time, gradually declining away and ceasing when the *vis viva* of the molecules is exhausted.

When a phosphorescent surface is exposed to the luminous source, it necessarily undergoes a rise of temperature, and the cohesion of its parts is diminished, but after its removal from that source, as the temperature declines and radiation goes on, the cohesion increases, and a restraint is put on those motions.

Now let the phosphorus have its tempera-

ture raised, and the cohesion of its molecules be thereby weakened, and the restraint on their motions abated. At once they resume their oscillations, and continue them to an extent that belongs to the temperature used. When this has passed away, a still higher temperature will release them once more, and the glowing will again be resumed.

What would be the result if we could cause the surface of a mass of water on which circular waves are rising and falling to be instantaneously congealed? It might be kept in that condition for a thousand years, and then, if instantaneously thawed, the waves would resume their ancient motion from the point at which it was arrested, and it would now go on to its completion.

So with these phosphori. Exposed to light of a suitable intensity, their parts begin to vibrate; but the freedom of those motions is interfered with by their cohesion. Amplitude of vibration must always be affected by cohesion, and if the ray be removed and the temperature be permitted to decline, the restraint becomes greater and greater, and they pass into a condition somewhat like that which has just been illustrated. It matters not how long a time may intervene, rise of temperature will enable them to resume their motions.

These principles give an explanation of all the facts we observe. We see how it is that as we advance from one temperature to another the phosphorus will resume its glow, and that there is, as it were, for every degree a certain amount of vibratory movement that can be accomplished, or, to use a different phrase, a certain amount of light that can be set free. It also necessarily follows that different solids will display these motions with different degrees of facility, and hence shine for a longer or shorter time, and with lights of different intensities.

But in liquids and gases, which want that particular condition of cohesion characteristic of the solid state, and the parts of which move freely among each other, phosphorescence can not take place, for it depends on the influence that cohesion has had in restraining the vibratory movements.

Further, the condition of opacity does not permit phosphorescence to be established. The exciting ray can not find access to disturb the interior layers of the mass, and even if it did, and phosphorescence ensued, how could we expect to be able to discover it through the impervious veil of the superficial layers? The light of the most brilliant phosphorus can not be seen through the thinnest gold-leaf. Its intensity is vastly too small. These are the reasons that no one has ever yet succeeded in detecting phosphorescence in metals and black bodies.

It will be gathered from this explanation that I am led to believe that all the facts

of phosphorescence can be fully explained on the principles of the communication of vibratory motion through the ether; that as upon that theory an incandescent body maintained at incandescence would eventually compel a cold body in its presence to come up to its own temperature by making its particles execute movements like those of its own, so the sunshine or the flash of an electric spark compels a vibratory move-

ment in the bodies on which its rays fall; that these vibrations are interfered with by cohesion in the case of solids, but that they are instantly established and almost as instantly cease in the case of liquids and gases; that reducing the cohesion of a solid by raising its temperature permits a resumption of the movement; and that the condition of opacity, whether metallic or otherwise, is a bar to the whole phenomenon.

A WOMAN-HATER.

CHAPTER XXIV.

ZOE was the first to speak, or rather to gasp. "Why do you come here?"

"Because *you* are here."

"And how dare you come where I am?—now your falsehood is found out and flung into my very face!"

"I have never been false to you. At this moment I suffer for my fidelity."

"You suffer? I am glad of it. How?"

"In many ways; but they are all light, compared with my fear of losing your love."

"I will listen to no idle words," said Zoe, sternly. "A lady claimed you before my face; why did you not stand firm like a man, and say, 'You have no claim on me now; I have a right to love another, and I do?' Why did you fly?—because you were guilty."

"No," said he, doggedly. "Surprised and confounded, but not guilty. Fool! idiot! that I was. I lost my head entirely. Yes, it is hopeless. You *must* despise me. You have a right to despise me."

"Don't tell me," said Zoe: "you never lose your head. You are always self-possessed and artful. Would to Heaven I had never seen you!" She was violent.

He gave her time. "Zoe," said he, after a while, "if I had not lost my head, should I have ill-treated a lady and nearly killed her?"

"Ah!" said Zoe, sharply, "that is what you have been suffering from. Remorse. And well you may. You ought to go back to her, and ask her pardon on your knees. Indeed, it is all you have left to do now."

"I know I ought."

"Then do what you ought. Good-by."

"I can not. I hate her."

"What, because you have broken her heart, and nearly killed her?"

"No; but because she has come between me and the only woman I ever really loved, or ever can."

"She would not have done that if you had not given her the right. I see her now; she looked justice, and you looked guilt. Words are idle, when I can see her face before me still. No woman could look like that who was in the wrong. But you—guilt made

you a coward: you were false to her and false to me; and so you ran away from us both. You would have talked either of us over, alone; but we were together: so you ran away. You have found me alone now, so you are brave again; but it is too late. I am undeceived. I decline to rob Mademoiselle Klosking of her lover; so good-by."

And this time she was really going, but he stopped her. "At least don't go with a falsehood on your lips," said he, coldly.

"A falsehood!—Me!"

"Yes, it is a falsehood. How can you pretend I left that lady for you, when you know my connection with her had entirely ceased ten months before I ever saw your face?"

This staggered Zoe a moment; so did the heat and sense of injustice he threw into his voice.

"I forgot that," said she, naïvely. Then, recovering herself, "You may have parted with her; but it does not follow that she consented. Fickle men desert constant women. It is done every day."

"You are mistaken again," said he. "When I first saw you, I had ceased to think of Mademoiselle Klosking; but it was not so when I first left her. I did not desert her. I tore myself from her. I had a great affection for her."

"You dare to tell me that! Well, at all events, it is the truth. Why did you leave her, then?"

"Out of self-respect. I was poor, she was rich and admired. Men sent her bouquets and bracelets, and flattered her behind the scenes, and I was lowered in my own eyes: so I left her. I was unhappy for a time; but I had my pride to support me, and the wound was healed long before I knew what it was to love, really to love."

There was nothing here that Zoe could contradict. She kept silence, and was mystified.

Then she attacked him on another quarter. "Have you written to her since you behaved like a ruffian to her?"

"No. And I never will, come what may. It is wicked of me; but I hate her. I am compelled to esteem her. But I hate her."

Zoe could quite understand that; but in

spite of that she said, "Of course you do. Men always hate those they have used ill. Why did you not write to *me*? Had a mind to be impartial, I suppose?"

"I had reason to believe it would have been intercepted."

"For shame! Vizard is incapable of such a thing."

"Ah, you don't know how he is changed. He looks on me as a mad dog. Consider, Zoe: do, pray, take the real key to it all. He is in love with Mademoiselle Klosking, madly in love with her: and I have been so unfortunate as to injure her—nearly to kill her. I dare say he thinks it is on your account he hates me; but men deceive themselves. It is for *her* he hates me."

"Oh!"

"Ay. Think for a moment, and you will see it is. *You* are not in his confidence. I am sure he has never told *you* that he ordered his keepers to shoot me down if I came about the house at night."

"Oh, no, no!" cried Zoe.

"Do you know he has raised the country against me, and has warrants out against me for forgery, because I was taken in by a rogue who gave me bills with sham names on them, and I got Vizard to cash them? As soon as we found out how I had been tricked, my uncle and I offered at once to pay him back his money. But no! he prefers to keep the bills as a weapon."

Zoe began to be puzzled a little. But she said, "You have been a long time discovering all these grievances. Why have you held no communication all this time?"

"Because you were inaccessible. Does not your own heart tell you that I have been all these weeks trying to communicate, and unable? Why, I came three times under your window at night, and you never, never would look out."

"I did look out ever so often."

"If I had been you, I should have looked ten thousand times. I only left off coming when I heard the keepers were ordered to shoot me down. Not that I should have cared much, for I am desperate. But I had just sense enough left to see that, if my dead body had been brought bleeding into your hall some night, none of you would ever have been happy again. Your eyes would have been opened, all of you. Well, Zoe, you left Vizard Court; that I learned: but it was only this morning I could find out where you were gone: and you see I am here—with a price upon my head. Please read Vizard's advertisements."

She took them and read them. A hot flush mounted to her cheek.

"You see," said he, "I am to be imprisoned if I set my foot in Barfordshire. Well, it will be false imprisonment, and Mademoiselle Klosking's lover will smart for it. At all events, I shall take no orders but from you.

You have been deceived by appearances. I shall do all I can to undeceive you, and if I can not, there will be no need to imprison me for a deceit of which I was the victim, nor to shoot me like a dog for loving *you*. I will take my broken heart quietly away, and leave Barfordshire, and England, and the world, for aught I care."

Then he cried; and that made her cry directly.

"Ah!" she sighed, "we are unfortunate. Appearances are so deceitful. I see I have judged too hastily, and listened too little to my own heart, that always made excuses. But it is too late now."

"Why too late?"

"It is."

"But why?"

"It all looked so ugly, and you were silent. We are unfortunate. My brother would never let us marry; and, besides—Oh, why did you not come before?"

"I might as well say, Why did you not look out of your window? You could have done it without risking your life, as I did. Or why did you not advertise? You might have invited an explanation from 'E. S.,' under cover to so-and-so."

"Ladies never think of such things. You know that very well."

"Oh, I don't complain; but I do say that those who love should not be ready to reproach; they should put a generous construction. You might have known, and you ought to have known, that I was struggling to find you, and torn with anguish at my impotence."

"No, no. I am so young and inexperienced, and all my friends against you. It is they who have parted us."

"How can they part us, if you love me still as I love you?"

"Because for the last fortnight I have not loved you, but hated you, and doubted you, and thought my only chance of happiness was to imitate your indifference: and while I was thinking so, another person has come forward; one whom I have always esteemed: and now, in my pity and despair, I have given him hopes." She hid her burning face in her hands.

"I see; you are false to me, and therefore you have suspected me of being false to you."

At that she raised her head high directly. "Edward, you are unjust. Look in my face and you may see what I have suffered before I could bring myself to condemn you."

"What! your paleness; that dark rim under your lovely eyes—am I the cause?"

"Indeed you are. But I forgive you. You are sadly pale and worn too. Oh, how unfortunate we are!"

"Do not cry, dearest," said he. "Do not despair. Be calm, and let me know the worst. I will not reproach you, though you

have reproached me. I love you as no woman can love. Come, tell me."

"Then the truth is, Lord Uxmoor has renewed his attention to me."

"Ah!"

"He has been here every day."

Severne groaned.

"Aunt Maitland was on his side, and spoke so kindly to me, and he saved my life from a furious bull. He is brave, noble, good, and he loves me. I have committed myself. I can not draw back with honor."

"But from me you can, because I am poor and hated, and have no title. If you are committed to him, you are engaged to me."

"I am; so now I can go neither way. If I had poison, I would take it this moment, and end all."

"For God's sake, don't talk so. I am sure you exaggerate. You can not, in these few days, have pledged your faith to another. Let me see your finger. Ah! there's my ring on it still: bless you, my own darling Zoe—bless you;" and he covered her hand with kisses, and bedewed it with his ever-ready tears.

The girl began to melt, and all power to ooze out of her, mind and body. She sighed deeply, and said, "What can I do—I don't say with honor and credit, but with decency—what *can* I do?"

"Tell me, first, what you have said to him that you consider so compromising."

Zoe, with many sighs, replied: "I believe—I said—I was unhappy. And so I was. And I owned—that I admired—and esteemed him. And so I do. And then of course he wanted more, and I could not give more; and he asked might he try and *make* me love him; and—I said—I am afraid I said—he might, if he could."

"And a very proper answer, too."

"Ah! but I said he might come every day. It is idle to deceive ourselves: I have encouraged his addresses. I can do nothing now with credit but die, or go into a convent."

"When did you say this?"

"This very day."

"Then he has never acted on it."

"No, but he will. He will be here to-morrow for certain."

"Then your course is plain. You must choose to-night between him and me. You must dismiss him by letter, or me upon this spot. I have not much fortune to offer you, and no coronet; but I love you, and you have seen me reject a lovely and accomplished woman, whom I esteem as much as you do this lord. Reject him? Why, you have seen me fling her away from me like a dog sooner than leave you in a moment's doubt of my love: if you can not write a civil note declining an earl for me, your love is not worthy of mine, and I will begone with my love. I will not take it to Mademoiselle

Klosking, though I esteem her as you do this lord; but, at all events, I will take it away from you, and leave you my curse instead, for a false, fickle girl that could not wait one little month, but must fall, with her engaged ring on her finger, into another man's arms. Oh, Zoe! Zoe! who could have believed this of you?"

"Don't reproach me. I won't bear it," she cried, wildly.

"I hope not to have to reproach you," said he, firmly; "I can not conceive your hesitating."

"I am worn out. Love has been too great a torment. Oh, if I could find peace!"

Again her tears flowed.

He put on a sympathizing air. "You shall have peace. Dismiss *him* as I tell you, and he will trouble you no more; shake hands with me, and say you prefer *him*, and I will trouble you no more. But with two lovers, peace is out of the question, and so is self-respect. I know I could not vacillate between you and Mademoiselle Klosking or any other woman."

"Ah, Edward, if I do this, you ought to love me very dearly."

"I shall. Better than ever—if possible."

"And never make me jealous again."

"I never shall, dearest. Our troubles are over."

"Edward, I have been very unhappy. I could not bear these doubts again."

"You shall never be unhappy again."

"I must do what you require, I suppose. That is how it always ends. Oh dear! oh dear!"

"Zoe, it must be done. You know it must."

"I warn you I shall do it as kindly as I can."

"Of course you will. You ought to."

"I must go in now. I feel very cold."

"How soon to-morrow will you meet me here?"

"When you please," said she, languidly.

"At ten o'clock?"

"Yes."

Then there was a tender parting, and Zoe went slowly in. She went to her own room, just to think it all over alone. She caught sight of her face in the glass. Her cheeks had regained color, and her eyes were bright as stars. She stopped and looked at herself. "There now," said she, "and I seem to myself to live again. I was mad to think I could ever love any man but him. He is my darling, my idol."

There was no late dinner at Somerville Villa. Indeed, ladies, left to themselves, seldom dine late. Nature is strong in them, and they are hungriest when the sun is high. At seven o'clock Zoe Vizard was seated at her desk trying to write to Lord Uxmoor. She sighed, she moaned, she began, and

dropped the pen and hid her face. She became almost wild; and in that state she at last dashed off what follows:

"DEAR LORD UXMOOR,—For pity's sake forgive the mad words I said to you to-day. It is impossible. I can do no more than admire and esteem you. My heart is gone from me forever. Pray forgive me, though I do not deserve it; and never see me nor look at me again. I ask pardon for my vacillation. It has been disgraceful; but it has ended, and I was under a great error, which I can not explain to you, when I led you to believe I had a heart to give you. My eyes are opened. Our paths lie asunder. Pray, pray forgive me, if it is possible. I will never forgive myself, nor cease to bless and revere you, whom I have used so ill.

"ZOE VIZARD."

That day Uxmoor dined alone with his mother, for a wonder, and he told her how Miss Vizard had come round; he told her also about the bull, but so vilely that she hardly comprehended he had been in any danger: these encounters are rarely described to the life, except by us who avoid them—except on paper.

Lady Uxmoor was much pleased. She was a proud, politic lady, and this was a judicious union of two powerful houses in the county, and one that would almost command the elections. But, above all, she knew her son's heart was in the match, and she gave him a mother's sympathy.

As she retired, she kissed him, and said, "When you are quite sure of the prize, tell me, and I will call upon her."

Being alone, Lord Uxmoor lighted a cigar and smoked it in measureless content. The servant brought him a note on a salver. It had come by hand. Uxmoor opened it, and read every word straight through, down to "Zoe Vizard;" read it, and sat petrified.

He read it again. He felt a sort of sickness come over him. He swallowed a tumbler of port, a wine he rarely touched; but he felt worse now than after the bull-fight. This done, he rose and stalked like a wounded lion into the drawing-room, which was on the same floor, and laid the letter before his mother.

"You are a woman, too," said he, a little helplessly. "Tell me—what on earth does this mean?"

The dowager read it slowly and keenly, and said, "It means—another man."

"Ah!" said Uxmoor, with a sort of snarl.

"Have you seen any one about her?"

"No; not lately. At Vizard Court there was. But that is all over now, I conclude. It was a Mr. Severne, an adventurer, a fellow that was caught out in a lie before us all. Vizard tells me a lady came and claimed him before Miss Vizard, and he ran away."

"An unworthy attachment, in short?"

"Very unworthy, if it was an attachment at all."

"Was he at Vizard Court when she declined your hand?"

"Yes."

"Did he remain, after you went?"

"I suppose so. Yes, he must have."

"Then the whole thing is clear: that man has come forward again unexpectedly, or written, and she dismisses you. My darling, there is but one thing for you to do. Leave her, and thank her for telling you in time. A less honorable fool would have hidden it, and then we might have had a Countess of Uxmoor in the Divorce Court some day or other."

"I had better go abroad," said Uxmoor, with a groan. "This country is poisoned for me."

"Go, by all means. Let Janneway pack up your things to-morrow."

"I should like to kill that fellow first."

"You will not even waste a thought on him, if you are my son."

"You are right, mother. What am I to say to her?"

"Not a word."

"What, not answer her letter? It is humble enough, I am sure—poor soul! Mother, I am wretched, but I am not bitter, and my rival will revenge me."

"Uxmoor, your going abroad is the only answer she shall have. The wisest man, in these matters, who ever lived has left a rule of conduct to every well-born man—a rule which, believe me, is wisdom itself:

'Le bruit est pour le fat, la plainte est pour le sot; L'honnête homme trompé s'éloigne, et ne dit mot.'

You will make a tour, and not say a word to Miss Vizard, good, bad, nor indifferent. I insist upon that."

"Very well. Thank you, dear mother: you guide me, and don't let me make a fool of myself, for I am terribly cut up. You will be the only Countess of Uxmoor in my day."

Then he kneeled at her feet, and she kissed his head and cried over him; but her tears only made this proud lady stronger.

Next day he started on his travels.

Now, but for Zoe, he would on no account have left England just then; for he was just going to build model cottages in his own village, upon designs of his own, each with a little plot, and a public warehouse or granary, with divisions for their potatoes and apples, etc. However, he turned this over in his mind while he was packing; he placed certain plans and papers in his dispatch-box, and took his ticket to Taddington, instead of going at once to London. From Taddington he drove over to Hillstoke, and asked for Miss Gale. They told him she was fixed at Vizard Court. That vexed him: he

did not want to meet Vizard. He thought it the part of a Jerry Sneak to go and howl to a brother against his sister. Yet, if Vizard questioned him, how could he conceal there was something wrong? However, he went down to Vizard Court; but said to the servant who opened the door, "I am rather in a hurry, Sir: do you think that you could procure me a few minutes with Miss Gale? You need not trouble Mr. Vizard."

"Yes, my laud. Certainly, my laud. Please step in the morning-room, my laud. Mr. Vizard is out."

That was fortunate, and Miss Gale came down to him directly.

Fanny took that opportunity to chatter and tell Mademoiselle Klosking all about Lord Uxmoor and his passion for Zoe. "And he will have her, too," said she, boldly.

Lord Uxmoor told Miss Gale he had called upon business. He was obliged to leave home for a time, and wished to place his projects under the care of a person who could really sympathize with them, and make additions to them, if necessary. "Men," said he, "are always making oversights in matters of domestic comfort: besides, you are full of ideas. I want you to be viceroy with full power, and act just as you would if the village belonged to you."

Rhoda colored high at the compliment.

"Wells, cows, granary, real education—what you like," said he. "I know your mind. Begin abolishing the lower orders in the only way they can be got rid of—by raising them in comfort, cleanliness, decency, and knowledge. Then I shall not be missed. I'm going abroad."

"Going abroad?"

"Yes. Here are my plans: alter them for the better, if you can. All the work to be done by the villagers. Weekly wages. We buy materials. They will be more reconciled to improved dwellings, when they build them themselves. Here are the addresses of the people who will furnish money. It will entail travelling; but my people will always meet you at the station, if you telegraph from Taddington. You accept? A thousand thanks. I am afraid I must be off."

She went into the hall with him, half bewildered, and only at the door found time to ask after Zoe Vizard.

"A little better, I think, than when she came."

"Does she know you are going abroad?"

"No. I don't think she does, yet. It was settled all in a hurry."

He escaped further questioning by hurrying away.

Miss Gale was still looking after him, when Ina Klosking came down, dressed for a walk, and leaning lightly on Miss Dover's arm. This was by previous consent of Miss Gale.

"Well, dear," said Fanny, "what did he say to you?"

"Something that has surprised and puzzled me very much." She then related the whole conversation, with her usual precision.

Ina Klosking observed quietly to Fanny that this did not look like successful wooing.

"I don't know that," said Fanny, stoutly. "Oh, Miss Gale, did you not ask him about her?"

"Certainly I did; and he said she was better than when she first came."

"There!" said Fanny, triumphantly.

Miss Gale gave her a little pinch, and she dropped the subject.

Vizard returned, and found Mademoiselle Klosking walking on his gravel. He offered her his arm, and was a happy man, parading her very slowly, and supporting her steps, and purring his congratulations into her ear. "Suppose I were to invite you to dinner, what would you say?"

"I think I should say, 'To-morrow.'"

"And a very good answer, too. To-morrow shall be a *fête*."

"You spoil me."

"That is impossible."

It was strange to see them together; he so happy, she so apathetic, yet gracious.

Next morning came a bit of human nature—a letter from Zoe to Fanny, almost entirely occupied with praises of Lord Uxmoor. She told the Bull story better than I have—if possible—and, in short, made Uxmoor a hero of romance.

Fanny carried this in triumph to the other ladies, and read it out. "There!" said she. "Didn't I tell you?"

Rhoda read the letter, and owned herself puzzled. "I am not, then," said Fanny: "they are engaged—over the bull; like Europa and—I forget who—and so he is not afraid to go abroad now. That is just like the men. They cool directly the chase is over."

Now the truth was that Zoe was trying to soothe her conscience with eloquent praises of the man she had dismissed, and felt guilty.

Ina Klosking said little. She was puzzled too at first. She asked to see Zoe's handwriting. The letter was handed to her. She studied the characters. "It is a good hand," she said; "nothing mean there." And she gave it back.

But, with a glance, she had read the address, and learned that the post-town was Bagley.

All that day, at intervals, she brought her powerful understanding to bear on the paradox; and though she had not the facts and the clew I have given the reader, she came near the truth in an essential matter. She satisfied herself that Lord Uxmoor was not engaged to Zoe Vizard. Clearly, if so, he would not leave England for months.

She resolved to know more; and just before dinner she wrote a line to Ashmead, and requested him to call on her immediately.

That day she dined with Vizard and the ladies. She sat at Vizard's right hand, and he told her how proud and happy he was to see her there.

She blushed faintly, but made no reply.

She retired soon after dinner.

All next day she expected Ashmead.

He did not come.

She dined with Vizard next day, and retired to the drawing-room. The piano was opened, and she played one or two exquisite things, and afterward tried her voice, but only in scales, and somewhat timidly, for Miss Gale warned her she might lose it or spoil it if she strained the vocal chord while her whole system was weak.

Next day Ashmead came with apologies. He had spent a day in the cathedral town on business. He did not tell her how he had spent that day, going about puffing her as the greatest singer of sacred music in the world, and paving the way to her engagement at the next festival. Yet the single-hearted Joseph had really raised that commercial superstructure upon the sentiments she had uttered on his first visit to Vizard Court.

Ina now held a private conference with him. "I think," said she, "I have heard you say you were once an actor."

"I was, madam, and a very good one, too."

"*Cela va sans dire*. I never knew one that was not. At all events, you can disguise yourself."

"Any thing, madam, from Grandfather Whitehead to a boy in a pinafore. Famous for my makes up."

"I wish you to watch a certain house, and not be recognized by a person who knows you."

"Well, madam, nothing is *infra dig*. if done for you; nothing is distasteful if done for you."

"Thank you, my friend. I have thought it well to put my instructions on paper."

"Ay, that is the best way."

She handed him the instructions. He read them, and his eyes sparkled. "Ah, this is a commission I undertake with pleasure, and I'll execute it with zeal."

He left her, soon after, to carry out these instructions, and that very evening he was in the wardrobe of the little theatre, rummaging out a suitable costume, and also in close conference with the wig-maker.

Next day Vizard had his mother's sables taken out and aired, and drove Mademoiselle Klosking into Taddington in an open carriage. Fanny told her they were his mother's sables, and none to compare with them in the country.

On returning she tried her voice to the

harmonium in her own antechamber, and found it was gaining strength—like herself.

Meantime Zoe Vizard met Severne in the garden, and told him she had written to Lord Uxmoor, and he would never visit her again. But she did not make light of the sacrifice this time. She had sacrificed her own self-respect as well as Uxmoor's, and she was sullen and tearful.

He had to be very wary and patient, or she would have parted with him too, and fled from both of them to her brother.

Uxmoor's wounded pride would have been soothed could he have been present at the first interview of this pair. He would have seen Severne treated with a hauteur and a sort of savageness he himself was safe from, safe in her unshaken esteem.

But the world is made for those who can keep their temper, especially the female part of the world.

Sad, kind, and loving, but never irritable, Severne smoothed down and soothed and comforted the wounded girl; and, seeing her two or three times a day—for she was completely mistress of her time—got her completely into his power again.

Uxmoor did not reply.

She had made her selection. Love beckoned forward. It was useless to look back.

Love was omnipotent. They both began to recover their good looks as if by magic; and as Severne's passion, though wicked, was earnest, no poor bird was ever more completely entangled by bird-lime than Zoe was caught by Edward Severne.

Their usual place of meeting was the shrubbery attached to Somerville Villa. The trees, being young, made all the closer shade, and the gravel-walk meandered, and shut them out from view.

Severne used to enter this shrubbery by a little gate leading from the meadow, and wait under the trees till Zoe came to him. Vizard's advertisements alarmed him, and he used to see the coast clear before he entered the shrubbery, and also before he left it. He was so particular in this that, observing one day an old man doddering about with a basket, he would not go in till he had taken a look at him. He found it was an ancient white-haired villager gathering mushrooms. The old fellow was so stiff, and his hand so trembling, that it took him about a minute to gather a single fungus.

To give a reason for coming up to him, Severne said, "How old are you, old man?"

"I be ninety, measter, next Martinmas-day."

"Only ninety?" said our Adonis, contemptuously; "you look a hundred and ninety."

He would have been less contemptuous had he known that the mushrooms were all toad-stools, and the village centenaire was

Mr. Joseph Ashmead, resuming his original arts, and playing Grandfather Whitehead on the green grass.

CHAPTER XXV.

MADemoiselle KLOSKING told Vizard the time drew near when she must leave his hospitable house.

"Say a month hence," said he.

She shook her head.

"Of course you will not stay to gratify me," said he, half sadly, half bitterly. "But you will have to stay a week or two longer *par ordonnance du médecin*."

"My physician is reconciled to my going. We must all bow to necessity."

This was said too firmly to admit a reply.

"The old house will seem very dark again whenever you do go," said Vizard, plaintively.

"It will soon be brightened by her who is its true and lasting light," was the steady reply.

A day or two passed with nothing to record, except that Vizard hung about Ina Klosking, and became, if possible, more enamored of her and more unwilling to part with her.

Mr. Ashmead arrived one afternoon about three o'clock, and was more than an hour with her. They conversed very earnestly, and when he went, Miss Gale found her agitated.

"This will not do," said she.

"It will pass, my friend," said Ina. "I will sleep."

She laid herself down and slept three hours before dinner.

She arose refreshed, and dined with the little party; and on retiring to the drawing-room, she invited Vizard to join them at his convenience.

He made it his convenience in ten minutes.

Then she opened the piano, played an introduction, and electrified them all by singing the leading song in "Siebel." She did not sing it so powerfully as in the theatre; she would not have done that even if she could; but still she sang it out, and nobly. It seemed a miracle to hear such singing in a room.

Vizard was in raptures.

They cooled suddenly when she reminded him what he had said, that she must stay till she could sing Siebel's song. "I keep to the letter of the contract," said she. "My friends, this is my last night at Vizard Court."

"Please try and shake that resolution," said Vizard, gravely, to Mesdemoiselles Dover and Gale.

"They can not," said Ina. "It is my destiny. And yet," said she, after a pause, "I would not have you remember me by that

flimsy thing. Let me sing you a song your mother loved; let me be remembered in this house, as a singer, by that."

Then she sang Handel's song:

"What though I trace each herb and flower
That decks the morning dew;
Did I not own Jehovah's power,
How vain were all I knew."

She sang it with amazing purity, volume, grandeur, and power; the lustres rang and shook, the hearts were thrilled, and the very souls of the hearers ravished. She herself turned a little pale in singing it, and the tears stood in her eyes.

The song and its interpretation were so far above what passes for music that they all felt compliments would be an impertinence. Their eyes and their long-drawn breath paid the true homage to that great master rightly interpreted—a very rare occurrence.

"Ah!" said she; "that was the hand could brandish Goliath's spear."

"And this is how you reconcile us to losing you," said Vizard. "You might stay, at least, till you had gone through my poor mother's collection."

"Ah! I wish I could. But I can not. I must not. My Fate forbids it."

"'Fate' and 'destiny,'" said Vizard, "stuff and nonsense. We make our own destiny. Mine is to be eternally disappointed, and happiness snatched out of my hands."

He had no sooner made this pretty speech than he was ashamed of it, and stalked out of the room, not to say any more unwise things.

This burst of spleen alarmed Fanny Dover. "There," said she, "now you can not go. He is very angry."

Ina Klosking said she was sorry for that; but he was too just a man to be angry with her long: the day would come when he would approve her conduct. Her lip quivered a little as she said this, and the water stood in her eyes: and this was remembered and understood, long after, both by Miss Dover and Rhoda Gale.

"When does your Royal Highness propose to start?" inquired Rhoda Gale, very obsequiously, and just a little bitterly.

"To-morrow at half past nine o'clock, dear friend," said Ina.

"Then you will not go without me. You will get the better of Mr. Vizard, because he is only a man; but I am a woman, and have a will as well as you. If you make a journey to-morrow, I go with you. Deny me, and you sha'n't go at all." Her eyes flashed defiance.

Ina moved one step, took Rhoda's little defiant head, and kissed her cheek. "Sweet physician and kind friend, of course you shall go with me, if you will, and be a great blessing to me."

This reconciled Miss Gale to the proceed-

ings. She packed up a carpet-bag, and was up early, making provisions of every sort for her patient's journey: air-pillows, soft warm coverings, medicaments, stimulants, etc., in a little bag slung across her shoulders. Thus furnished, and equipped in a uniform suit of gray cloth and wide-awake hat, she cut a very sprightly and commanding figure, but more like Diana than Hebe.

The Klosking came down, a pale Juno, in travelling costume; and a quarter of an hour before the time a pair-horse fly was at the door, and Mr. Ashmead in the hall.

The ladies were both ready.

But Vizard had not appeared.

This caused an uneasy discussion.

"He must be very angry," said Fanny, in a half whisper.

"I can not go while he is," sighed la Klosking. "There is a limit even to my courage."

"Mr. Harris," said Rhoda, "would you mind telling Mr. Vizard?"

"Well, miss," said Harris, softly, "I did step in and tell him. Which he told me to go to the devil, miss—a hobobservation I never knew him to make before."

This was not encouraging. Yet the Klosking quietly inquired where he was.

"In there, ma'am," said Harris. "In his study."

Mademoiselle Klosking, placed between two alternatives, decided with her usual resolution. She walked immediately to the door and tapped at it; then, scarcely waiting for an instant, opened it and walked in with seeming firmness, though her heart was beating rather high.

The people outside looked at one another. "I wonder whether he will tell *her* to go to the devil," said Fanny, who was getting tired of being good.

"No use," said Miss Gale; "she doesn't know the road."

When la Klosking entered the study, Vizard was seated, disconsolate, with two pictures before him. His face was full of pain, and la Klosking's heart smote her. She moved toward him, hanging her head, and said, with inimitable sweetness and tenderness, "Here is a culprit come to try and appease you."

There came a time that he could hardly think of these words and her penitent, submissive manner with dry eyes. But just then his black dog had bitten him, and he said, sullenly, "Oh, never mind me. It was always so. Your sex have always made me smart for— If flying from my house before you are half recovered gives you half the pleasure it gives me pain and mortification, say no more about it."

"Ah! why say it gives me pleasure? My friend, you can not really think so."

"I don't know what to think. You ladies are all riddles."

"Then I must take you into my confidence, and, with some reluctance, I own, let you know why I leave this dear kind roof to-day."

Vizard's generosity took the alarm. "No," he said, "I will not extort your reasons. It is a shame of me. Your bare will ought to be law in this house; and what reasons could reconcile me to losing you so suddenly? You are the joy of our eyes, the delight of our ears, the idol of all our hearts. You will leave us, and there will be darkness and gloom, instead of sunshine and song. Well, go; but you can not soften the blow with reasons."

Mademoiselle Klosking flushed, and her bosom heaved; for this was a strong man, greatly moved. With instinctive tact, she saw the best way to bring him to his senses was to give him a good opening to retreat.

"Ah, monsieur," said she, "you are *trop grand Seigneur*. You entertain a poor wounded singer in a chamber few princes can equal. You place every thing at her disposal; such a physician and nurse as no queen can command; a choir to sing to her; royal sables to keep the wind from her, and ladies to wait on her. And when you have brought her back to life, you say to yourself, She is a woman; she will not be thoroughly content unless you tell her she is adorable. So, out of politeness, you descend to the language of gallantry. This was not needed. I dispense with that kind of comfort. I leave your house because it is my duty, and leave it your grateful servant and true friend to my last hour."

She had opened the door, and Vizard could now escape. His obstinacy and his heart would not let him.

"Do not fence with me," said he. "Leave that to others. It is beneath *you*. If you had been content to stay, I would have been content to show my heart by halves. But when you offer to leave me, you draw from me an avowal I can no longer restrain, and you must and shall listen to it. When I saw you on the stage at Homburg, I admired you and loved you that very night. But I knew from experience how seldom in women outward graces go with the virtues of the soul. I distrusted my judgment. I feared you, and I fled you. But our destiny brought you here, and when I held you, pale and wounded, in my very arms, my heart seemed to go out of my bosom."

"Oh, no more! no more, pray!" cried Mademoiselle Klosking.

But the current of love was not to be stemmed. "Since that terrible hour I have been in heaven, watching your gradual and sure recovery; but you have recovered only to abandon me, and your hurry to leave me drives me to desperation. No, I can not part with you. You must not leave me, either this day or any day. Give me your

hand, and stay here forever, and be the queen of my heart and of my house."

For some time la Klosking had lost her usual composure. Her bosom heaved tumultuously, and her hands trembled. But at this distinct proposal the whole woman changed. She drew herself up, with her pale cheek flushing and her eyes glittering.

"What, Sir?" said she. "Have you read me so ill? Do you not know I would rather be the meanest drudge that goes on her knees and scrubs your floors, than be queen of your house, as you call it? Ah, Jesu, are all men alike, then; that he whom I have so revered, whose mother's songs I have sung to him, makes me a proposal dishonorable to me and to himself?"

"Dishonorable!" cried Vizard. "Why, what can any man offer to any woman more honorable than I offer you? I offer you my heart and my hand, and I say, do not go, my darling. Stay here forever, and be my queen, my goddess, my wife!"

"YOUR WIFE?" She stared wildly at him.

"Your wife? Am I dreaming, or are you?"

"Neither. Do you think I can be content with less than that? Ina, I adore you."

She put her hand to her head. "I know not who is to blame for this," said she, and she trembled visibly.

"I'll take the blame," said he, gayly.

Said Ina, very gravely, "You, who do me the honor to offer me your name, have you asked yourself seriously what has been the nature of my relation with Edward Sevrerne?"

"No!" cried Vizard, violently; "and I do not mean to. I see you despise him now; and I have my eyes and my senses to guide me in choosing a wife. I choose you—if you will have me."

She listened, then turned her moist eyes full upon him, and said to him, "This is the greatest honor ever befell me. I can not take it."

"Not take it?"

"No; but that is my misfortune. Do not be mortified. You have no rival in my esteem. What shall I say, my friend?—at least I may call you that. If I explain now, I shall weep much, and lose my strength. What shall I do? I think—yes, that will be best—you shall go with me to-day."

"To the end of the world!"

"Something tells me you will know all, and forgive me."

"Shall I take my bag?"

"You might take an evening dress and some linen."

"Very well. I won't keep you a moment," said he, and went up stairs with great alacrity.

She went into the hall, with her eyes bent on the ground, and was immediately pinned by Rhoda Gale, whose piercing eye, and inquisitive finger on her pulse, soon discovered

that she had gone through a trying scene. "This is a bad beginning of an imprudent journey," said she: "I have a great mind to countermand the carriage."

"No, no," said Ina; "I will sleep in the railway and recover myself."

The ladies now got into the carriage; Ashmead insisted on going upon the box; and Vizard soon appeared, and took his seat opposite Miss Gale and Mademoiselle Klosking. The latter whispered her doctress: "It would be wise of me not to speak much at present." La Gale communicated this to Vizard, and they drove along in dead silence. But they were naturally curious to know where they were going; so they held some communication with their eyes. They very soon found they were going to Tad-dington Station.

Then came a doubt—were they going up or down?

That was soon resolved.

Mr. Ashmead had hired a saloon carriage for them, with couches and conveniences.

They entered it; and Mademoiselle Klosking said to Miss Gale, "It is necessary that I should sleep."

"You shall," said Miss Gale.

While she was arranging the pillows and things, la Klosking said to Vizard, "We artists learn to sleep when we have work to do. Without it I should not be strong enough this day." She said this in a half-apologetic tone, as one anxious not to give him any shadow of offense.

She was asleep in five minutes; and Miss Gale sat watching her at first, but presently joined Vizard at the other end, and they whispered together. Said she, "What becomes of the theory that women have no strength of will? There is Mademoiselle *Je-le-veux* in person. When she wants to sleep, she sleeps; and look at you and me—do you know where we are going?"

"No."

"No more do I. The motive power is that personification of divine repose there. How beautiful she is with her sweet lips parted, and her white teeth peeping, and her upper and lower lashes wedded; and how graceful!"

"She is a goddess," said Vizard. "I wish I had never seen her. Mark my words, she will give me the sorest heart of all."

"I hope not," said Rhoda, very seriously.

Ina slept sweetly for nearly two hours, and all that time her friends could only guess where they were going.

At last the train stopped, for the sixth time, and Ashmead opened the door.

This worthy, who was entirely in command of the expedition, collected the luggage, including Vizard's bag, and deposited it at the station. He then introduced the party to a pair-horse fly, and mounted the box.

When they stopped at Bagley, Vizard suspected where they were going.

When he saw the direction the carriage took, he knew it, and turned very grave indeed.

He even regretted that he had put himself so blindly under the control of a woman. He cast searching glances at Mademoiselle Klosking to try and discover what on earth she was going to do. But her face was as impenetrable as marble. Still she never looked less likely to do any thing rash or in bad taste. Quietness was the main characteristic of her face, when not rippled over by a ravishing sweetness; but he had never seen her look so great, and lofty, and resolute, as she looked now; a little stern, too, as one who had a great duty to do, and was inflexible as iron. When truly feminine features stiffen into marble like this, beauty is indeed imperial, and worthy of epic song; it rises beyond the wing of prose.

My reader is too intelligent not to divine that she was steeling herself to a terrible interview with Zoe Vizard—terrible mainly on account of the anguish she knew she must inflict.

But we can rarely carry out our plans exactly as we trace them—unexpected circumstances derange them or expand them; and I will so far anticipate as to say that in this case a most unexpected turn of events took la Klosking by surprise.

Whether she proved equal to the occasion, these pages will show very soon.

CHAPTER XXVI.

POIKILUS never left Taddington—only the "Swan." More than once he was within sight of Ashmead unobserved. Once, indeed, that gentleman, who had a great respect for dignitaries, saluted him; for at that moment Poikilus happened to be a sleek dignitary of the Church of England. Poikilus, when quite himself, wore a mustache, and was sallow, and lean as a weasel; but he shaved and stuffed and colored for the dean. Shovel-hat, portly walk, and green spectacles did the rest. Grandfather Whitehead saluted. His reverence chuckled.

Poikilus kept Severne posted by letter and wire as to many things that happened outside Vizard Court; but he could not divine the storm that was brewing inside Ina Klosking's room. Yet Severne defended himself exactly as he would have done had he known all. He and Zoe spent Elysian hours, meeting twice a day in the shrubbery, and making love as if they were the only two creatures in the world; but it was blind Elysium only to one of them—Severne was uneasy and alarmed the whole time. His sagacity showed him it could not last, and there was always a creeping terror on him.

Would not Uxmoor cause inquiries? Would he not be sure to tell Vizard? Would not Vizard come there to look after Zoe, or order her back to Vizard Court? Would not the Klosking get well, and interfere once more? He passed the time between heaven and hell; whenever he was not under the immediate spell of Zoe's presence, a sort of vague terror was always on him. He looked all round him, wherever he went.

This terror, and his passion, which was now as violent as it was wicked, soon drove him to conceive desperate measures. But, by masterly self-government, he kept them two days to his own bosom. He felt it was too soon to raise a fresh and painful discussion with Zoe. He must let her drink unmixed delight, and get a taste for it; and then show her on what conditions alone it could be had forever.

It was on the third day after their reconciliation she found him seated on a bench in the shrubbery, lost in thought, and looking very dejected. She was close to him before he noticed; then he sprang up, stared at her, and began to kiss her hands violently, and even her very dress.

"It is you," said he, "once more."

"Yes, dear," said Zoe, tenderly; "did you think I would not come?"

"I did not know whether you could come. I feel that my happiness can not last long. And, Zoe dear, I have had a dream. I dreamed we were taken prisoners, and carried to Vizard Court, and on the steps stood Vizard and Mademoiselle Klosking arm in arm; I believe they were man and wife. And you were taken out and led, weeping, into the house, and I was left there raging with agony. And then that lady put out her finger in a commanding way, and I was whirled away into utter darkness, and I heard you moan, and I fought, and dashed my head against the carriage, and I felt my heart burst, and my whole body filled with some cold liquid, and I went to sleep, and I heard a voice say, 'It is all over; his trouble is ended.' I was dead."

This narrative, and his deep dejection, set Zoe's tears flowing. "Poor Edward!" she sighed. "I would not survive you. But cheer up, dear; it was only a dream. We are not slaves. I am not dependent on any one. How can we be parted?"

"We shall, unless we use our opportunity, and make it impossible to part us. Zoe, do not slight my alarm and my misgivings; such warnings are prophetic. For Heaven's sake, make one sacrifice more, and let us place our happiness beyond the reach of man."

"Only tell me how."

"There is but one way—marriage."

Zoe blushed high, and panted a little, but said nothing.

"Ah!" said he, piteously, "I ask too much."

"How can you say that?" said Zoe. "Of course I shall marry you, dearest. What! do you think I could do what I *have* done for any body but my husband that is to be?"

"I was mad to think otherwise," said he; "but I am in low spirits, and full of misgivings. Oh, the comfort, the bliss, the peace of mind, the joy, if you would see our hazardous condition, and make all safe by marrying me to-morrow."

"To-morrow! Why, Edward, are you mad? How can we be married, so long as my brother is so prejudiced against you?"

"If we wait his consent, we are parted forever. He would forgive us after it—that is certain. But he would never consent. He is too much under the influence of his—of Mademoiselle Klosking."

"Indeed, I can not hope he will consent beforehand," sighed Zoe; "but I have not the courage to defy him; and if I had, we could not marry all in a moment, like that. We should have to be cried in church."

"That is quite gone out among ladies and gentlemen."

"Not in our family. Besides, even a special license takes time, I suppose. Oh no, I could not be married in a clandestine, discreditable way. I am a Vizard—please remember that. Would you degrade the woman you honor with your choice?"

And her red cheeks and flashing eyes warned him to desist.

"God forbid!" said he. "If that is the alternative, I consent to lose her—and lose her I shall."

He then affected to dismiss the subject, and said, "Let me enjoy the hours that are left me. Much misery or much bliss can be condensed in a few days. I will enjoy the blessed time, and we will wait for the chapter of accidents that is sure to part us." Then he acted reckless happiness, and broke down at last.

She cried, but showed no sign of yielding. Her pride and self-respect were roused and on their defense.

The next day he came to her quietly sad. He seemed languid and listless, and to care for nothing. He was artful enough to tell her, on the information of Poikilus, that Vizard had hired the cathedral choir three times a week to sing to his inamorata; and that he had driven her about Taddington, dressed, like a duchess, in a whole suit of sables.

At that word the girl turned pale.

He observed, and continued: "And it seems these sables are known throughout the county. There were several carriages in the town, and my informant heard a lady say they were Mrs. Vizard's sables, worth five hundred guineas—a Russian princess gave them her."

"It is quite true," said Zoe. "His mother's sables! Is it possible?"

"They all say he is caught at last, and this is to be the next Mrs. Vizard."

"They may well say so, if he parades her in his mother's sables," said Zoe, and could not conceal her jealousy and her indignation. "I never dared so much as ask his permission to wear them," said she.

"And if you had, he would have told you the relics of a saint were not to be played with."

"That is just what he would have said, I do believe." The female heart was stung.

"Ah, well," said Severne, "I am sure I should not grudge him his happiness, if you would see things as he does, and be as brave as he is."

"Thank you," said Zoe. "Women can not defy the world as men do." Then, passionately, "Why do you torment me so? why do you urge me so? a poor girl, all alone, and far from advice. What on earth would you have me do?"

"Secure us against another separation, unite us in bliss forever."

"And so I would if I could; you know I would. But it is impossible."

"No, Zoe; it is easy. There are two ways: we can reach Scotland in eight hours; and there, by a simple writing and declaration before witnesses, we are man and wife."

"A Gretna Green marriage?"

"It is just as much a legal marriage as if a bishop married us at St. Paul's. However, we could follow it up immediately by marriage in a church, either in Scotland or the north of England. But there is another way: we can be married at Bagley, any day, before the registrar."

"Is that a marriage—a real marriage?"

"As real, as legal, as binding, as a wedding in St. Paul's."

"Nobody in this county has ever been married so. I should blush to be seen about after it."

"Our first happy year would not be passed in this country. We should go abroad for six months."

"Ay, fly from shame."

"On our return we should be received with open arms by my own people in Huntingdonshire, until your people came round, as they always do."

He then showed her a letter, in which his pearl of a cousin said they would receive his wife with open arms, and make her as happy as they could. Uncle Tom was coming home from India, with two hundred thousand pounds; he was a confirmed old bachelor, and Edward his favorite, etc.

Zoe faltered a little: so then he pressed her hard with love, and entreaties, and promises, and even hysterical tears; then she began to cry—a sure sign of yielding. "Give me time," she said—"give me time."

He groaned, and said there was no time

to lose. Otherwise he never would have urged her so.

For all that, she could not be drawn to a decision. She must think over such a step.

Next morning, at the usual time, he came to know his fate. But she did not appear. He waited an hour for her. She did not come. He began to rage and storm, and curse his folly for driving her so hard.

At last she came, and found him pale with anxiety, and looking utterly miserable. She told him she had passed a sleepless night, and her head had ached so in the morning she could not move.

"My poor darling!" said he; "and I am the cause. Say no more about it, dear one. I see you do not love me as I love you, and I forgive you."

She smiled sadly at that, for she was surer of her own love than his.

Zoe had passed a night of torment and vacillation; and but for her brother having paraded Mademoiselle Klosking in his mother's sables, she would, I think, have held out. But this turned her a little against her brother; and, as he was the main obstacle to her union with Severne, love and pity conquered. Yet still Honor and Pride had their say. "Edward," said she, "I love you with all my heart, and share your fears that accident may separate us. I will let you decide for both of us. But, before you decide, be warned of one thing. I am a girl no longer, but a woman, who has been distracted with many passions. If any slur rests on my fair name, deeply as I love you now, I shall abhor you then."

He turned pale, for her eye flashed dismay into his craven soul.

He said nothing; and she continued: "If you insist on this hasty, half-clandestine marriage, then I consent to this—I will go with you before the registrar, and I shall come back here directly. Next morning early we will start for Scotland, and be married that other way before witnesses. Then your fears will be at an end, for you believe in these marriages; only, as I do not—for I look on these *legal* marriages merely as solemn betrothals—I shall be Miss Zoe Vizard, and expect you to treat me so, until I have been married in a church, like a lady."

"Of course you shall," said he; and overwhelmed her with expressions of gratitude, respect, and affection.

This soothed her troubled mind, and she let him take her hand and pour his honeyed flatteries into her ear, as he walked her slowly up and down.

She could hardly tear herself away from the soft pressure of his hand and the fascination of his tongue, and she left him, more madly in love with him than ever, and ready to face any thing but dishonor for him. She was to come out at twelve o'clock, and walk into Bagley with him to betroth herself to

him, as she chose to consider it, before the stipendiary magistrate, who married couples in that way. Of the two marriages she had consented to, merely as preliminaries to a real marriage, Zoe despised this the most; for the Scotch marriage was, at all events, ancient, and respectable lovers had been driven to it again and again.

She was behind her time, and Severne thought her courage had failed her after all: but no: at half past twelve she came out, and walked briskly toward Bagley.

He was behind her, and followed her. She took his arm nervously. "Let me feel you all the way," she said, "to give me courage."

So they walked arm in arm; and, as they went, his courage secretly wavered, hers rose at every step.

About half a mile from the town they met a carriage and pair.

At sight of them a gentleman on the box tapped at the glass window, and said, hurriedly, "Here they are *together*."

Mademoiselle Klosking said, "Stop the carriage:" then, pausing a little, "Mr. Vizard—on your word of honor, no violence."

The carriage was drawn up, Ashmead opened the door in a trice, and la Klosking, followed by Vizard, stepped out, and stood like a statue before Edward Severne and Zoe Vizard.

Severne dropped her arm directly, and was panic-stricken.

Zoe uttered a little scream at the sight of Vizard; but the next moment took fire at her rival's audacity, and stepped boldly before her lover, with flashing eyes and expanded nostrils that literally breathed defiance.

A FEAR.

Oh, what is happiness, when fear
Starts like a pale unbidden ghost
That steals across the banquet-hall,
And spills the draught we long for most!

For when I look at her it comes,
The fear that she may leave us soon—
So perfect in the morning light,
How can the blossom last till noon!

The soft and shining baby hair
Seems but a nimbus round the brow;
The sweet amazement of the eye
Asks what they do in heaven now.

I marvel what they do there, too,
Without her in that far still land:
I tremble lest I turn and see
Great angels in the sunbeam stand—

Great angels, whose departing wings
Shall spread a shadow on the air,
Since having earth so bright, I fear
Heaven be not heaven without her there!

GARTH:*

A Nobel.

CHAPTER XXI.

FERMENTATION.

THREE days before Christmas there was again a gathering round the broad kitchen hearth of Urmhurst. Cuthbert sat in the centre of the group, the high dark back of his chair rising above his clear pale face, which became more transparent and spiritual-looking every day. The brightness of his eyes, however, and the indomitable cheerfulness of his bearing did much to counteract the impression which his bodily frailty tended to produce. Elinor sat next to him, and then came Golightley, Mrs. Tenterden, and the parson. The last two had of late contracted a genial partnership with each other, the chief object of which seemed to be to discuss people and events of years long gone by.

On the opposite side of the fire-place sat Madge and Garth, and Nikomis was in her old place, which none but she might occupy. The laboring oar of the conversation was in the hands of the elders of the party; indeed, as Mrs. Tenterden was just observing, the young people, who had every reason to be lively and talkative, were as sedate and laconic as a Quaker meeting, and thereby, she supposed, brought upon herself and others the reproach of garrulity. "However," she added, "I've got something to tell you, daughter, that I expect will set the tongues of all of you a-going. I shall tell you what Christmas present I mean to give you. Or maybe I'll let you all guess—that 'll be better;" and the kind lady chuckled comfortably and folded her statuesque arms.

But the subject appeared to be a so difficult one that, after several unsuccessful attempts had been made, Mrs. Tenterden was fain to lift the veil herself. "Why, how stupid you all are! I'm going to give her the money that is got back from our robbers when they are caught. She would have had it when she was married, at any rate, and maybe I'd as well call it a dowry as a Christmas present; only, as Christmas came before the wedding, and life is so uncertain, I thought I'd better lose no time."

The parson rewarded this sally with his customary stentorian "Haw! haw! haw!" but several members of the company appeared to think it more impressive than amusing. Elinor, however, replied, with a smile and with heightened color,

"I shouldn't have minded waiting, particularly. A Barmecide dowry is as good one time as another, though life is so uncertain."

"What a pity the robbers, or one of them, could not have heard you, Aunt Mildred!" remarked Madge. "I'm sure he would have gone straight off and brought you the money."

"My good fathers!" cried Mrs. Tenterden, with a shudder, and glancing over her shoulder, "I'd

rather never have the money than that the awful creature himself should bring it to me!"

"Even robbers are men, and repentant robbers are not a bad sort of men," said Garth.

"If one of them could have heard you say that, he would have thanked you," was Golightley's observation.

"Since we are discussing such splendid donations," said Cuthbert, "I may as well tell Garth that unless some authenticated claimant puts in an appearance before the allotted period has expired, I shall give him Urmhurst and fifty thousand dollars."

"If we could only manage to prove that the claimant was one of the robbers, and shut him up in prison for life, you might both of you look forward to a fortune," laughed Madge.

"I shouldn't care for the claimant's money, even if he were a convict," Garth answered. "Well, the only Christmas present I have to make is a proposal that we should all go down to the lake on Christmas-eve and skate. We will make a great affair of it. There shall be the biggest bonfire that was ever seen, and all the village, besides ourselves, shall be there to see it. There is a full moon on that night, and if the ice is only in good condition, it ought to be as successful a picnic as any of the parson's."

This suggestion met with general approval. "As to that about the ice, though," said Golightley, leaning forward and stroking his mustache. "Is there good reason to suppose that it is all that it ought to be in view of such an occasion? Any body been down there lately?"

"I don't think there can be any doubt; this snow fell before the lake froze. However, we might go down and see."

"Happy thought, by George!" exclaimed Golightley. He jumped up and looked out of the window. "It's a superb night. What do you say to some of us wrapping up warm and starting down there to-night? Look at that moon!"

"Mercy, Golightley, you'd catch your death!" cried Mrs. Tenterden. But some of the others favored the idea; and finally the four lovers, as Mrs. Tenterden called them, resolved to go. While Madge and Elinor were putting on their cloaks and hoods, Garth went out and harnessed a horse to the double sleigh. There was a weak place, which had never been properly mended, in one of the runners; but he trusted to luck that it would not break down, and so drove round to the door. The three waiting there got in, and they all started off with much noise and festivity. The moon shining upon the snow made the woods as light as day, and the road had been sufficiently trodden to render the sleighing easy. They reached the lake without accident, and when Garth had tested the thickness of the ice, and found it safe, they drove slowly out upon it toward the little islet at the mouth of the cove.

"By George, that ice beats my experience! eh, Garth?" said Golightley. "It's like driving on air. Upon my word, I can see the stones at the bottom—ten feet at least."

"How thick is the ice?" asked Elinor.

* Entered according to Act of Congress, in the year 1875, by JULIAN HAWTHORNE, in the office of the Librarian of Congress, at Washington.

"About nine inches," replied Garth. "I never saw it so smooth and fine as this. It seems to be just as good all over."

"Where shall we have the bonfire?" asked Madge.

"On the nose of the island, so that it can be seen all over the lake, and far down the river besides. We can stable the horses in the shed which I believe is still standing there, and cook and eat our dinner in the midst of warmth and comfort."

They came to the island, and passing round the little promontory, the great panorama of valley, lake, and river lay before them. The river had been dammed lower down, and had overflowed its banks to the breadth of half a mile; and this polished pathway, like a black mirror twenty miles long, glistened in its white setting of snow, lonely and silent, further than the eye could follow it. But further still, Wabeno showed his faint outline against the sky, looking like the mighty ghost of a mountain that had ceased to exist save in tradition.

"I wish I had my skates here!" exclaimed Madge. "It's perfect now; day after to-morrow will not be so fine as to-day."

"Do you know how to skate, Elinor?" asked Garth.

"Hardly at all; but it seems as if I could learn any thing such a night as this."

"And I—since nobody will say it for me—I am the fortunate purveyor of this delectation," observed Golightley. "Remember it in my favor, friends, whenever you have occasion to think ill of me."

"One can not carry a December night about in one's mind *all* the time, Uncle Golightley," retorted Madge, maliciously. "But you do know how to skate, Elinor; at least you have a lovely skating suit, and I have been making one to look exactly like it."

"So that one of you will be mistaken for the other! Ha! I suspect a plot," said Golightley, laughing. "By-the-bye, Garth, what became of your friend Selwyn? Is his business so pressing that he can not postpone it for a treat like this?"

"He may be here; he is mysterious in his movements. Professor Grindle, too, sent me word a day or two ago that he should try and spend Christmas-day with us. But we must be getting home, since we have no better bonfire than the moon to warm us."

He turned the horse as he spoke; but the animal slipped, and in recovering itself, brought its hind-hoof in contact with the infirm sleigh runner, breaking it beyond all present remedy. It therefore became necessary that at least two of the party should walk home, and after some discussion it was arranged that those two should be Elinor and Golightley. The sleigh was drawn under cover of the shed, and when Garth had led the horse to the main-land, he mounted, Madge put her foot on his and sprang up behind him, and they rode away through the glimmering forest.

Elinor took Golightley's arm, and for a little while they walked on in silence; for Golightley was not so imperturbable a wooer as he had once been, and his audacity seemed even less when he was alone with his mistress than in company. This subdued bearing had been very grateful to Elinor;

yet it was not of a kind that might have led her to suspect him of a decline in his affection toward her, but rather the contrary. For though never obtruding himself upon her, or attempting any thing in the way of personal magnetism, as he had not spared to do in the earlier stages of their acquaintance, he had a way of silently watching her when he thought she was unaware of it, of divining and fulfilling her wishes while they were yet in embryo, and of receiving her words with an undemonstrative reverence that was flattering, because so evidently sincere. Nay, he was a trifle too subservient for her taste, for she was not a nature that feels it delightful to condescend, and often she found herself trying to force him into a stronger and more independent attitude toward her than he was himself inclined to assume. She was doing her best to like him, and by dint of resolutely shutting her eyes to all that might tend to discredit him, and magnifying every thing that made in his favor, she could almost anticipate something like success. She would have defended him against any detractor; and when he unwittingly spoke or acted against what seemed to her his best presentment, she was ready to defend him against himself.

At last he broke the silence by saying, with something of a nervous tremor in his voice and laugh, "By-the-bye, Elinor, an odd idea that of Mildred's about your dowry, wasn't it? Ha! ha!"

"The Barmecide dowry? Well, it may turn out a reality."

"What should you say, now—this is only one of my eccentric fancies, you know—but what should you say if some strange chance were to bring you that dowry, and at the same time were to—ha! ha!—were to—"

"Were to what?"

"Well, say, were to leave me a beggar?"

"How do you mean?"

"What if I were a beggar, now—by my voluntary act—and you were the possessor of eighty thousand pounds?"

"Wait a moment," interrupted Elinor, speaking with the perfect distinctness of utterance that always characterized her when excited. "I would rather talk of something else. You have never told me where you were going to take me after we are married."

"I shall not have the right to decide. I shall be your dependent, my dear Elinor, living on your bounty, and even owing my personal liberty to—"

"Golightley, did you hear what I said? I thought if you liked Europe better, I should prefer it on some accounts too. We might come back afterward, you know, if we didn't like it. Don't you think so?"

"Elinor, I—by George, I love you too well—I love you more than any thing! I wouldn't speak of my crime but for that. If you could believe how I repent—if you could forgive me!"

"Is it such a crime to love me?" said Elinor, laughing sharply, and turning her face away from the spectacle of his too manifest agitation. "How can you ask me to forgive you for repenting of that? I wish you would answer my question about Europe. I think my mother would like it better."

"My God! don't make it so hard for a poor devil, Elinor. You'll never forgive me, and that's why you won't hear me. Elinor, the guilt of that robbery—"

"Stop! stop! stop!" She clung to his arm and pressed her forehead against his shoulder. They were both trembling with excitement; but after a few moments Elinor steadied her nerves by main force, and said, in a husky tone, "Will you come home now quietly? Remember we are going to be married. I have not asked for any thing to be told me. But if any thing is said, it could not be unsaid. I'll walk home alone. I think you must have been drinking."

It was an appeal—a final desperate expedient for remaining blind and deaf. But intense as her will to restrain the confession was, Golightley was now too much unmanned to be restrained. What was in him to say must out; and when Elinor heard him laugh hysterically at her impugment of his sobriety, she felt the uselessness of further opposition. She quitted his arm abruptly, and moved onward, haughty and cold.

"If I only could get you to see what my life has been, how one phase has developed into another," said Golightley, walking beside her in his wretchedness. "By George! it has seemed as if destiny had always had a spite against me. I can say truly that I've always meant well. But I believe my very gifts—my peculiar fineness of perception and all that—have helped lead me wrong. If I'd been of such clay as other men, I should have done well enough."

"Don't speak as if I knew any thing, if you please. I know nothing. Tell me what is the matter in as few words as you can, since you've begun. I would not have listened to it from any body else."

But it was hard for him to speak plainly, when it came to the point. The crookedness of a lifetime made itself felt. He must hesitate and temporize on the verge of his gulf, though longing to plunge headlong.

"You know my gift for finance; of course every body knows that; but it was a gift with a curse on it. I could make any body's fortune but my own. Well, then—where was I? Oh! when I got acquainted with poor dear John and all of you, you know what he thought of me, how he believed in me? And, by George! the good that he saw in me was there, though there was bad mixed in with it, of course. Well, I wouldn't take charge of the money, though dear old John asked me to time and again; and though I knew that, it being Mildred's, and Mildred and I brother and sister, even if John had given it me out and out, it would have been in the family all the same."

"Did you—steal—this money?" asked Elinor, slowly, stopping and facing him, but with her eyes downcast.

He glanced round at her with a blanched, wretched look, his hand feeling about the side locks of his hair, and wandering down over his beard. "It seems a terrible thing to say that," muttered he. "But, upon my word, I've never had a moment's peace of mind or self-respect since then. But I haven't told you what—ha! ha!—what the lawyers call the extenuating circumstances. Oh, Elinor, so help me God, there are extenuating circumstances! It was that scoundrel Flint that got me into it."

"You stole your friend's money, who loved you and trusted you! What must I believe next? Ah, dear me!" She still spoke with lagging utterance, and the last words were a heavy sigh. Then, though with manifest effort and shrinking,

she raised her head and made her eyes rest upon him. It was a look even more terrible to give than to sustain. For it seems evident that Golightley did not appreciate the worst aspect of the crime he had committed. He regarded it as an offense against morals, against good taste, and, more deplorable still, against respectability. He was miserable at the loss of his prestige in the eyes of the world and of Elinor; and what most poignantly affected him was the shame involved in the actual process of confession. When that was over he would expect to feel better. But if every thing had turned out comfortably, if his guilt had never been brought to light, and he had been able to play the part of benefactor and philanthropist with the proceeds of his thievery, neither his heart nor his conscience would have been disturbed. And finally, that the knowledge of his degradation might give pain to Elinor deeper than he was himself capable of feeling had never occurred to him.

"I had expected," said he at last—"I had expected, Elinor, that you'd at least give me credit for having spoken out before we were married. If you knew what my love for you has grown to be lately! I didn't know, frankly, what the capacities in me for loving were till within the last month. And yet I risk your loss, by George!"

"What credit did you expect for speaking out?" inquired Elinor, with a sudden kindling of indignation. "You were a coward to speak out. You ought sooner to have died than insult me by confessing your deformity. If you had been true to the evil you had chosen, I might have had a kind of respect for you. But there is no manliness about you. You confessed only because you feared I should find you out in some other way. It was cowardly and dastardly and insulting. I would have listened to no evidence but yours. You thought I was as treacherous as you; but you have thrown away the only trust that any one will ever have in you."

"Destiny is against me, or this would be none of I," said Golightley, with a kind of reckless bravado.

"I ought to thank you, though," Elinor went on, not heeding him in her passionate preoccupation. "I can believe myself now—I was right in detesting you from the first moment I ever saw you. You were as contemptible as you looked. I am glad you are a criminal—I am glad! At least I am free now."

"My God, Elinor, can you never forgive me? Can't you care for me a little still?"

She stopped again, and gazed at him with that strange uneven glance that was yet so direct and disconcerting, and there was a kind of smile hovering about her beautiful lips that compelled Golightley to realize his degradation as no frown could have done. "That doesn't seem reasonable, Mr. Urmson. You are not very lovable. I don't know how to care for a person who has spoiled my life, and taken away my self-respect, and forced me to believe evil good and good evil. Did you think that the better I knew you, the better I should like you? I know that you first asked me to marry you because you were afraid that the thought of your crime might inconvenience you unless you did something to palliate it, and you wanted to use me as the balm to your conscience. After you had stolen your friend's money, you thought you would steal me for your

wife, so that you might say no such great harm had been done after all. Did you never think that only a very bad woman would not be degraded by marrying you? I haven't a very high opinion of myself, but I am worth a better compliment than that."

"If you only knew what you're worth to me! It isn't merely to make me happy, you know, but it would be saving a human soul. Only you can do it; and I'm not too far gone to be saved—by George, I'm not!"

"I have a soul too," returned Elinor, the sarcasm passing from her voice and expression, and a wistful melancholy taking its place. "You have taken away the freshness from it already, and if we lived together, it would lose whatever else it has worth preserving. It could not help you that I should be destroyed, and it is not right I should let myself be destroyed for nothing. Loving me can not save you, nor my loving you—"

"Ah, well, so be it!" interrupted Golightley, shrugging his shoulders, with a short empty laugh. "If it comes to loving the Lord and keeping His commandments, I presume I'm done for. So be it! I'll disappear. You may think less despitefully of me some day, when things come to be known that are not known now. Heigh-ho!"

"Poor creature! who will pity him if I do not?" thought Elinor to herself, compassionately. Fortunately her sense of justice was too keen and true to allow of her being entrapped into yielding too much to the gentler sentiment. But she felt that, somehow, the very fact of her having suffered such indignity at his hands had given him a claim upon her. Providence had ordained that their paths should cross; ought she not to do what she could that the meeting might not have been entirely for evil?

"I will not think despitefully of you," said she, "though I shall never be what I might have been if I had never seen you; and we must always be apart after this. If hoping and caring that you should do well will be of any good to you, I may help you so far. You said you had given back all you had taken?"

"All that the—ha! ha!—the other scoundrel hadn't done away with."

"Is it true that he has proofs against you?"

"He won't have them long. I've bargained with him, and he'll surrender them in consideration of a check for ten thousand pounds."

"How can that be if you have given it all back to us?"

"Well," replied Golightley, "I didn't intend to have troubled you with the details; but the long and short of it is that the check won't be paid when he presents it."

"Do you mean that you are going to cheat even your accomplice?" exclaimed Elinor, with irrepressible disgust.

"Ah, well, you can deliver me up to the majesty of the law, if that'll make you happier. I deserve it, of course. But my being eaten up won't save Mr. Flint."

"You need not misunderstand me so," said Elinor, flushing indignantly. "I wish no harm or punishment to either you or him. But there shall be no more cheating. You have not yet given him the false check?"

"It still lacks my indorsement. When he hands me the letters—"

"If the letters can not be got from him in any

other straightforward way, he must be honestly paid for them. Since the money is mine now, I shall pay him."

"My dear Elinor! my dear Elinor!" exclaimed Golightley. Her proposal seemed to have taken him completely by surprise; it changed his recklessness to an emotion that brought tears to his eyes. "I— No, no; my safety is not worth that sacrifice."

"Money is not what I care most for," returned she, a little coldly. "You asked me to sacrifice myself a few minutes ago. But you must not think I do this only on your account; it is for Mrs. Tenterden and your brother as well. They would not wish to see you—in prison!"

"Oh, Elinor, if you could have said it was partly for your sake too! But no; let it go—no one will care. I will refuse Flint the check, and he may keep the letters and do his worst. I have a grain or two of pride somewhere about me still, by George! I won't accept your noble and generous offer."

"I shall never be likely to ask another favor of you. Please not to refuse this. You have no right to refuse it."

"If you would only say it mattered a snap of the finger to you what became of me!" broke forth Golightley, with real passion. "You are so cold to a poor devil that loves you; you make him know he has affections, only to freeze him when he's at your feet. A drop of warm human charity would give him life to feel your justice."

Elinor began to tremble and catch her breath. "I do not wish to be uncharitable and cold," she said, brokenly. "I am all alone. I have no one to defend me. I must defend myself in the best way I can. God gave me my life, and I try to keep it pure and good. I am afraid to do as I am. It is only because I am so weak that I seem so hard. I would be kind, and help people if I could."

Golightley passed his hand across his face and groaned. "I shall find out all I've lost some day," he muttered. "Be cold again, Elinor. By George, I can't stand your kindness! I'm only flesh and blood."

"You'll let me do that?" she asked, hurriedly and timidly. "Where is he? How can I get to him?"

Golightley considered with himself a while, and then said, "He can't be got at just at present. You never can tell exactly where to find a fellow like that. Selwyn and his detectives are on the look-out for him, and he has to keep close. But I shall have to meet him in about a week, and then we can arrange the affair."

There was something odd and embarrassed in his manner as he made this speech, insomuch that Elinor was not entirely free from misgiving. "You do not promise," she said.

"Ah—well, the truth is, I—ha! ha!—I was afraid you might not—"

"I will believe your promise."

"I thank you," said he; then, clearing his throat, and attempting to recover the jaunty air which he had sometimes affected, "Be the oath recorded. Given life and liberty, your commands shall be obeyed. Of course if I should turn up dead and buried within the next six days, you'd let me off, eh? Ha! ha!"

"I shall believe you," repeated Elinor, gently; "and I thank you too."

They were standing, facing each other, a few paces apart; and now there was a short silence. It was broken by Golightley.

"I sha'n't be able to get away from here till after this affair is settled," said he, clearing his throat again; "but I presume there won't be any more *tête-à-tête* for us, so I'll say 'addio' now. Good-by, Elinor Golightley: may I have been the only pitfall in your path!"

Elinor's sad lips could utter no words; but after a moment's hesitation, she drew her slender hand from her muff and held it out to him. He stepped quickly forward and took it between both his; but, as if resolved to outdo himself on this final occasion, he did not offer to kiss it. In a few seconds he relinquished it, and walking onward, left Elinor alone. But as she followed in the same direction, she caught glimpses of him ever and anon at the turnings of the path beyond, where he waited to see that she did not lose her way. But when the forest became more open he disappeared, and she reached home solitary.

Never before had Elinor so greatly felt the need of some friend to whom she might tell her trouble, who would sympathize with and counsel her, and never had she been so isolated. Mrs. Tenterden, Cuthbert, Garth, Madge, all were alike impracticable: whether any of them suspected the truth about Golightley she knew not; but she must wait until the end came, when and whatever that might be. Meanwhile her thoughts gave her no peace; the night passed almost sleeplessly, and when at length day confronted her, she felt that it was to be endured rather than lived through.

Though she had not loved the man who had so disgracefully failed her, yet he had occupied a lover's place, and whatever gentle emotions had visited her heart, she had felt it in duty bound to train toward him, striving with faithful desire to render her observances so generous that they might in time become spontaneous and sincere. Thus Golightley had represented something real to her, though himself a sham; and when he suddenly ceased to exist (as far as her intents and purposes were concerned), she was as a vine robbed of its support, which, though perhaps but an infirm wooden post, had nevertheless stood in the stead of a column of marble. The delicate tendrils of her nature groped after something which might fill the place of what had been lost. It seems a mistake to suppose that those whose affections have undergone rude treatment are less susceptible to new influences immediately than after some time has elapsed. The forlornness of recent abandonment calls out more urgently for comfort than that which time has injured to its condition. Elinor, possibly, had never been in a mood so accessible to the enterprise of a true and ardent lover as when she walked out to take the medicine of air and exercise on the morning following her interview with Golightley.

The road she took led toward the river, and thence along the bank to the lake. After walking a mile or so, Elinor came in view of a little hut or shed roughly constructed of logs and bark; smoke was issuing from a primitive sort of chimney at one end, and before the door a man was standing with a cigar in his mouth. Upon hearing her step on the snow he turned quickly, and

immediately began to make joyful gestures of greeting. As Elinor got nearer, she perceived that it was Jack Selwyn.

"Good-morning, princess!" exclaimed he. "Permit me to rejoice that you have dispensed with your retinue this morning. You were out in full force on the pond last night. Yes, I was there," he added, smiling at Elinor's look of surprise; "but five is almost as poor company as three, you know."

"Why do you stay here? We thought you were hundreds of miles away."

"I've only been here a few days. Will you come in and take a look at my palace? I have always looked upon you as the princess in the fairy tale, and wanted to be the fairy prince. Come in—it's very jolly."

Elinor followed him in with a brighter expression on her face than had been seen there of late: Selwyn had the happy faculty of raising people's spirits. The tiny interior was odorous of pine resin; a log was burning in the rude fireplace, and Jack, with great ceremony, offered her a seat on the wood-pile. "This is an adaptation of a hut Garth built ever so long ago, when he was making a birch canoe, which he afterward took down the rapids. I find it very comfortable. It's a convenient place to study the formation of ice in."

"Why don't you come to Urmhurst?"

"Well, for reasons. Changes are in the wind. I'll be able to tell you soon."

"I have heard it all. It is I that must tell you some things."

Jack stared. "What do you know?"

"I know who robbed us. Golightley himself told me on the way home from the lake. And he has given back all he had."

"Golightley told you! and given it back, has he?" repeated Jack, catching up his knee and biting his mustache thoughtfully. He glanced sharply at Elinor, as if to see what temper she was in.

"You mustn't feel too much cut up about it," said he. "I didn't know whether I ought to tell you before or not. I did give you a sort of hint once, you know. But do you know quite what a scamp the fellow was? Did he tell you that the thousand pounds he borrowed of John Tenterden were the means which enabled him to commit the robbery? and that—"

"I did not ask him; I had rather not know," interrupted Elinor, coloring.

"Well, I think you owe it to yourself and other people to hear," returned Jack, resolutely. "If you go off with the idea that although he weakly let himself be ensnared to evil, still there's a good deal to be said in his favor, you'll be doing injustice to him, and to us, and to yourself. Now the fact is that never was a meaner and more treacherous theft committed than this. Golightley took advantage of confidential disclosures John had made to him, and of letters John had written, to forge an order on his bankers for the purchase of some half million dollars' worth of South American mining shares. Then he and his partner in business—Mr. Flint by name, and Sam Kineo by nature—contrived very ingeniously to depreciate the stock so far that, what with the thousand pounds Golightley borrowed, and some other odd lendings, they were actually able to buy it all in. Then the false reports were corrected,

and the stock, being really sound; rose like a rocket, and they realized at whatever figure they pleased. Luckily Kineo, by some petty felony, had put himself definitely within reach of the law; and if we can only catch him, and get hold of the proofs of the forgery and conspiracy which he has, we can have them both in State-prison in no time."

Here Jack, who had spoken as fast as possible in order to avoid interruption, paused and twirled his fur cap. "I'm glad that's off my mind, at any rate," he added, as Elinor sat silent. "Many's the time it's made my very bones ache to keep it in."

"I was in no danger of thinking too well of him," observed Elinor. "But they are neither of them to go to State-prison. I am going to get the proofs from Kineo and burn them."

"The deuce you are! I mean, how?"

Elinor explained briefly. Jack listened with the keenest attention.

"You don't really mean to throw away ten thousand pounds on that—trash!" he exclaimed.

"It will not be thrown away."

Jack bit his mustache and frowned. He had his own convictions on this subject, but he was wise enough to take up another topic of conversation instead of trying to make Elinor adopt his views. "Oh, that little villain of a Madge Danver!" murmured he, laughing. "What a wild-goose chase she did send me on!"

"Then Madge did know something about this?" exclaimed Elinor. "I couldn't help thinking she must sometimes."

"Bless your heart, princess, she was an arch-conspirator all the way through. She understood the whole matter long before I did, and took counsel with herself deliberately as to whether Golightley, Kineo, or myself were her most eligible partner. But she quarreled with Golightley, and in me she was disappointed; so I fancy Kineo is to be the happy man. He certainly will be, if you carry out your fell purpose of buying the proofs of him."

"Oh! are you sure that— I don't think I understand."

"Well, I can't myself believe, small as is my reverence for Master Golightley, that her hold upon him was other than threatening him with an exposure," said Jack, hesitating a little, while his cheeks reddened. "There must be a limit to the worst human depravity."

"But I mean," said Elinor, blushing too—"I mean—about Garth?"

"Oh, we're safe in calling that match off, at all events. But her whole affair with Garth has always been a sort of mystery. Mr. Urmson thinks she loves him, after a fashion of her own. I sometimes agree with him, and sometimes not; but however that may be, she has evidently given up all idea of marrying since somewhere."

"Does Garth love her?" asked Elinor, in a low voice.

"He has bullied himself into believing it," returned Jack, with a laugh. "But when she runs away and leaves him, he will soon find himself face to face with the fact that I warned him of years ago, when we were at college—that he is married to his painting, and that any engagement outside of that would be bigamous."

Elinor got up from the wood-pile and stood for a few moments with her hands hanging folded

and her eyes on the fire. Then, with a sigh, she moved toward the door.

"Madge must not do such a thing," she said, turning to Jack with troubled eyes. "It would be too sad, after all that has happened. If she wants to go to Europe, and see beautiful things and great people, she shall go with mother and me. She can be as gay and fashionable as she pleases. I'm sure it's natural she should wish to be, she is so brilliant and beautiful. I will speak to her to-morrow."

"You'll find that a more extravagant charity than the other," ventured Jack, twisting his mustache, and eying her gravely.

"I shall like it the better, then," returned she, with a passing smile. "This money seems to have had a curse upon it so far; I don't need it, and I should be glad enough if I could do a little good with it, after so much harm. I don't want to be rich; I should like to live by my music."

She stepped across the threshold and out into the sparkling snow and sunshine. Jack took his courage in his hands and followed her.

"Princess Elinor," said he, "why should you lavish all your bounty on the rogues, and leave the poor honest men out in the cold?"

"Only the rogues seem to need it," she answered, smiling again.

"No, for then I would be a rogue; and I'm not. I've been a good-for-nothing all my life, but I have always revered good women, and told the truth to every body. Don't you think you could give me something too?"

"I'm afraid I have nothing for you," said Elinor, startled.

"Look here! I don't want ten thousand pounds, nor to be gay and fashionable at your expense; I only want the greatest treasure on earth, and that's you. I love you with all my heart and soul. I always have loved you, and I never loved any other woman. Elinor, say you'll be my wife. I believe I could make you happy. I will make you happy."

"I can not—oh, I can not!" said she, trembling and looking away. "I never can be married. I think I should hate the man I married, even if I had loved him before; marriage has seemed such a sad thing to me since I looked forward to it at all. It seems like going to prison."

"But it shall be coming out of prison to be my wife. And I know it was wrong to ask you so soon after all this fuss. But I won't be impatient; I'll give you forever to think it over in. At least as long as that fellow in the Bible did—seven—months, wasn't it?"

Elinor laughed nervously, digging with the point of her foot in the snow.

"I won't try to persuade you on the grounds of the difference it would make to me," continued Jack, "because that would keep me talking all the seven months. But you should be as much mistress of the world as a man who has seen the world, and worships whatever part of it you stand upon, can make you. By-and-by, even if you didn't find much of any thing to admire in me, you would have associated so many jolly things with me that at last you'd count me in as one of them, almost without meaning to. Do say, at least, that you won't begin by saying no."

It was not easy wholly to resist such pleading, not the words so much as the manner of it. Jack was so immensely in earnest, so heart and soul

in what he was saying, his face and voice expressed so much more than his sentences, and the concentrated energy of his will made itself so strongly felt, that Elinor, though she had been all No when he first opened the subject, could not at once say no when he had ceased. And why should she say no at once? The ardor and utterness of his devotion touched her, coming at the moment of her greatest loneliness. No doubt the marriage would give her a scope and freedom of life which she might not easily attain otherwise; and perhaps, also, it offered opportunities for generosity and unselfishness which a solitary existence would lack. Why say no at all?

Again, she had not been called upon for an immediate positive answer, one way or the other. She was to be allowed time to question and examine the new idea on all sides, and to decide upon it at leisure. All that was asked of her now was not to say no. She had always liked Jack, the impact of whose vigorous and manly nature was an infinite relief after the clamminess of Golightley. And Jack had, unconsciously, used one argument which had sunk more deeply into Elinor's heart than any of his deliberate ones: "Garth is married to his painting." Then what need for Elinor to be oversolicitous about her destiny?

All this time Jack's bright hazel eyes were searching her face, which was turned downward. She lifted it, and their glances met. Jack drew himself up like a soldier before the enemy. The color sprang to his cheeks.

"But you do not know me," said she, faintly.

"I love you! I could not say 'I know you' if we'd been married a century. There would still be a thousand new—lovelinesses to learn."

"You say too much. I have nothing to give you. I do not love you, and I know I never can. It would spoil a true friendship if you try to make it any thing more."

"No, no. Whatever you do, don't think of friendship!" exclaimed Jack, with great earnestness. "There never yet was a true friendship between a man and a woman. But just stand still and let me love you. Don't move."

"I don't know that it's worth while for me to care how I am disposed of; but that's an ungracious thing to say. I like you so much that—I feel sure we were not meant for each other."

"But don't say no; whatever you do, don't say no." He came one entreating step nearer.

"I won't say it, then, now. But," she added, hurriedly, for the passionate delight that leaped into Jack's eyes frightened her, "I'm afraid it will make it harder for you and me if it has to be said hereafter. But you shall at least know something of me, and then, perhaps, you will thank me for not having said yes."

"I am only afraid that one of us will die, for this is too good to be true. Oh, Elinor, Elinor, Elinor! No, don't be frightened. I mean to be as subdued and circumspect as a duenna. But a duenna may kiss your hand just once. Elinor, don't you think seven weeks would be long enough?"

"Oh no, Jack," she said, panting and turning pale, and there was genuine dismay in her eyes and voice. "Remember this is not a promise—not an engagement."

"No, of course not. But it was only by accident that I said seven months. You know those Bible fellows lived hundreds of years."

Elinor could not help laughing, though there were tears on her eyelashes; and so they parted for that time.

Early in the afternoon of this same day Madge came to Urmhurst. Garth had gone out. She went up to the garret without making her presence known to any one below stairs, and did not re-appear for more than an hour. She was pale, but there was extraordinary brilliance in her eyes, and a deliberation and stateliness in her movements, such as might indicate a great bracing up and dilation of the spirit within. On the upper landing she met Golightley, who accompanied her to the lower floor with his customary affability. At the foot of the stairs they paused.

"There is an enterprising air about you this afternoon, Miss Maggie," remarked he. "Are any fresh projects in suspense?"

"None that concern me, Uncle Golightley. But I believe Mr. Kineo would like to see you."

"Ah! I presume he desires to rid himself of those—ah—documents, doesn't he?"

"From what he said, I don't think he means to give them to you until after he is quite sure that they can be of no further use to him."

"H'm! He doesn't expect me to— By-the-bye, it's dismally cold out here, and staircases have ears. What if we step into the kitchen for a few minutes?"

No one was in the kitchen. Madge leaned up against one side of the fire-place, with her foot on the brass andiron; Golightley half leaned, half sat, on the table, and caressed his face thoughtfully.

"If Sam has become so cautious—or has taken such cautious advice, Miss Maggie—as to mistrust my good faith, I fear we can't make a trade. It would be impossible for me to draw ready money myself, because I'm shadowed, and couldn't get away to the city. As to my giving information before he has time to get safe out of reach, or any thing of that sort, if he is ass enough to believe it, he simply cuts his own nose off. And I certainly am not going to let him keep those documents until he has cashed the check and got out of the country."

"Probably he wouldn't expect any thing so unbusiness-like, Uncle Golightley. But might not some compromise be made? What if he were to hand the letters to some one here, who would give them to you on receiving word from him to do so?"

"Ha! ha! an excellent idea; the only objection to it being the difficulty of finding a common friend of both parties—one whom I could trust to hand me the documents when Sam sent him word, and whom Sam could trust to keep them from me until leave was given to surrender them."

"Yes; but I think," said Madge, glancing at her companion out of the corner of her dark eye—"I think Mr. Kineo has found such a person."

Golightley stopped caressing his cheeks, and put both feet to the floor.

"Who is it?"

"It's Garth, I believe."

"You believe it's—*Garth*?" He took a long breath, and retained it for several seconds, his chin thrown up and his brows drawn together. "Well, I don't," he affirmed at last, bringing his hands together with a clap, and walking to the opposite side of the hearth.

"I was afraid you wouldn't," returned Madge, with a light laugh. "You think Garth is so stupid. But you may change your mind some day. At all events, Garth knows all about your affairs and Mr. Kineo's. And he has been to see Mr. Kineo in the wigwam, and has made all arrangements for him. It is on his account that Garth will have the skating party to-morrow. Mr. Kineo will be able to skate down the river in the evening without any body's noticing. And it is Garth who will keep your documents for you, Uncle Golightley."

"When does Mr. Kineo propose to hand them to him?"

"Oh, Garth has had them for several days."

"If that be the case," rejoined Golightley, after a pause to recover himself, "I may take the liberty to keep my money in my pocket. I begin to think it's Mr. Kineo who is stupid."

"Not quite so stupid as that," answered Madge, laughing again. "Garth paid him fifty thousand dollars in bank-notes for the documents; and you will give him the check you would have given Sam, and more too, perhaps."

"H'm! Upon my word, this is interesting. By George, Garth is coming out!"

"You see, Garth found out, among other things, that Sam was the heir to the Eve legacy; so he was able to offer him the money, and Professor Grindle sent it to him. It all came out very nicely, didn't it?"

"Has Garth got the certificates of the heirship?" demanded Golightley, with an eagerness he could not wholly disguise.

Madge smiled and shook her head. "Mr. Kineo wants to feel that he can always prove his right to call you uncle. He is the most affectionate nephew I ever saw; more so than Garth, I'm sure."

"Ah! *belle dame sans merci!* You don't leave me a loop-hole, do you? Not one—not one—not one! H'm! Now I suppose you will forthwith marry Garth and settle down here quietly. He, of course, had no impolite questions to ask as to how you had become so well informed on all these knotty points, and as to your reasons for not confiding in him until now?"

"There was no need to ask such questions, Uncle Golightley," answered Madge, serenely. "He knows that what knowledge I had came to me accidentally through my intimacy with Nikomis, and that I had not told about it because I hoped things might be arranged somehow so that the family name need not be disgraced. Garth trusts me perfectly. Why should he not? I suppose Elinor Golightley trusts you?"

Possibly this last stab had more effect than Madge imagined; it may have determined Golightley in a course of action as to which he had hesitated until then. He made no reply, however, though his face twitched and grew whiter than before. But later in the afternoon, as he walked alone toward the lake, he repeated to himself more than once, "There is one loop-hole, Miss Maggie; just one."

Although Golightley had never actually been checked in his movements, he was well aware that all his goings and comings were observed, and he even had a tolerably accurate idea as to where he might be likely (should he be disposed thereto) to meet the watch-dogs of the law face to face. He

was not, however, aware that Selwyn himself was in the neighborhood; and it was therefore a surprise to both of them when they encountered one another in one of the wood paths between the village and the junction of the mill-stream and lake.

"A cold afternoon, Jack. I think we shall have fine weather to-morrow, though. I'm glad you've returned from your trip in season to join our party on the ice."

"Well, Master Golightley, I hadn't made up my mind whether or not to go."

"I don't think we shall be able to do without you. Have you heard the latest developments of this robbery business?"

Jack looked at him attentively, wondering whether the man could be meditating some evasion even at this stage of affairs. "I'm open to instruction," said he.

"It's a philosophic virtue," observed the other, "to know when you're beaten; and I'm free to admit that I have been, pretty thoroughly. But even philosophers have their weaknesses, and mine is, not to get the kickings that belong to other people in addition to my own. Now our friend Sam Kineo, *alias* Flint, who is (as you are probably aware by this time) on a visit to his grand-mamma in the attic at Urmhurst, proposes to start for foreign parts to-morrow evening, with ten thousand pounds ready money in his trouser pockets."

"Aha! I conceive you, Sir. You gave him this money in exchange for—"

"Well guessed—well guessed!" interrupted Golightley, with his empty little laugh; "but you are out for once. Very likely that's what I intended to do, but I was forestalled. I haven't got the documents, and somebody else—my nephew Garth, namely—gave him the money. The money, of course, is the Eve legacy of which you have heard, and which was the last scrap of Urmson property extant, after my ravages. Garth, being desirous of saving the family honor, and all that sort of thing, dumps it into Kineo's pocket, receives the inconvenient papers, and recommends my fellow-outlaw to be off as fast as his skates can carry him."

"That's news, certainly. Where did you pick it up?"

"From the young lady who, as I take it, is to share the rewards and dangers of Mr. Kineo's future career—unless, indeed, she has contrived a way to outwit him as well as the rest of us. She imparted the information to me, you understand, on the assumption that self-interest weighed a few ounces more in my balance than was actually the case. By-the-bye, I may as well tell you that some few weeks ago I paid in to the account of the lady who was to have been my wife the sum of eighty and odd thousand pounds. It's all I had, except enough to—keep me in gloves and cigarettes for a month or two."

The tone and manner of Golightley's reference to Elinor smote Jack with compassion. In his preceding utterances had been perceptible only the jaunty bravado which strove to disguise, however poorly, the wretched squalor of exposed rascality. But when he mentioned her who, to him as well as to Jack, was the first and dearest of womankind, his voice had become hoarse, and the haggard lines in his face had seemed to deepen. "If he really loved her," thought Jack, "to

have lost her is punishment enough for meaner crimes than his. God knows how far I am from deserving her myself!"

"Look here!" said he, aloud, planting himself face to face with his interlocutor; "I don't see but what you deserve some credit for this hint. Of course it gratifies your spite to block Kineo's little game, and I suppose you rely on Garth not to use the proofs against you. Still, you are risking something, and I've no right to suppose that your chief motive is not to save your brother and Garth their fifty thousand dollars. And I'm sorry for you, anyway! What do you mean to do with yourself if you get out of this scrape?"

"Ah, well—*absit invidia*, my dear Jack, but I may be allowed to remark that that's my own business."

"I know; but I had a reason for asking. Confound it! look here; I've got a lot more money than I know what to do with. What do you say to my shipping you off to Australia—my people have a place of business there—and putting you in the way of making a good living, if you'll work a little for it? You can make a new man of yourself there, in every sense of the word. What do you say?"

"It's kind of you, Jack, by George! But I hardly think I'm up to any thing of that kind now. The fact is, I've done so much of that sort of thing—campaigning about at other fellows' expense, you know—that I'm tired of it. I don't seem to have the stuff in me; talent enough, but it don't seem to work out in the right way. No, I'm afraid I shouldn't do your introduction any credit. I'm pretty well tired out—I'm pretty well tired out."

"Oh, while there's life there's hope," returned Jack. But he could not help acknowledging to himself that Golightley's words were true; every thing about him testified to an exhaustion of moral and mental resources almost beyond hope of remedy.

"Well, think it over," he added, "and we'll speak of it again next week. Probably we'll be able to let Kineo off, with a caution or two, when we've made him hand back the legacy; so he won't stand in your way. I shall like to give you a lift if I can."

Golightley stood silent a little while, staring abstractedly first to one side and then to the other, and settling and resettling his eyeglasses on his nose. Then, appearing suddenly to recollect himself, he lifted his hat to Jack, and said, abruptly,

"Till next week, then. What was it? Ah, yes—kind of you—devilish kind, by George! Next week, then. By-by, Jack. *Auf wiedersehen*, as we said in Germany." And so, waving his hand, he passed on.

Jack continued his walk in the opposite direction, pondering over what had passed. "Poor devil!" murmured he; "there doesn't seem to be much left of him."

"But to think of dear old Garth, my genius, whom nobody ever suspected of awakening from the reveries of imagination and idealism, actually making a practical man of affairs out of himself, and concocting a plot for bringing things right, without saying a word to any body! Well, no doubt he might beat any of us at our own game if he chose to set his mind to it. The plot would have worked, beyond a doubt, but for the incalculable contingency of Golightley's butting against

himself. I shouldn't wonder, too, if Garth punched my head well for interfering with it; but it won't do to let that half-breed pickpocket get clean off with the fifty thousand, even if he did tell some lies about who his mother was.

"Look here! Of course Garth can have no suspicion of Madge's rascalities? No; these geniuses, who can see through stone walls if they only fix their eyes on them, can be blinder than dead men when they choose not to see. She could make him believe what she liked about herself with half a word. And, after all, there's nothing definite against her; nothing to be sworn to—only to be sworn at. Ha! ha! ha! By Jingo! it's a shame for me to be giggling here about these things; but I'm so confoundedly happy on my own account, I should giggle at a funeral! Well, if Miss Madge will only start on an elopement with that scamp, it will at least have the good effect of proving even to the satisfaction of—Hullo! behold him!"

In fact, Garth came suddenly into view, walking rapidly, with his head down, and making cuts at the snow before him with his stick. He was close to Selwyn before becoming aware of him.

"Jack! I thought you were in Canada?" They shook hands.

"Who told you I was in Canada?"

"Madge."

"Did she tell you who sent me up there?"

"Well, it was to keep you out of mischief," said Garth, with a smile.

"That means she has told him some lie," thought Jack, thus accounting for his friend's light treatment of the matter. "Well, probably I might be quoted as a busybody without a monstrous distortion of the truth."—"You wish me back there, then?" he demanded, aloud.

"No; you can save me trouble. Sam Kineo is to escape to-morrow night. You can keep your men out of the way better than I can; so do it."

"Ha! my lord is imperious. Will he deign to remember that I serve not his interests, but those of his betters?"

"I have the means of unloading that wretched uncle of mine to the uttermost farthing. I shall do substantial justice, without the injustice of publicity."

"Listen to the autocrat! Might your slave petition for a guarantee?"

"Take my word, Jack."

"The sublime assurance! I wonder if there's any single thing in the world that Garth Macchiavelli Urmson does not know? Methinks not one."

"I know that you and I are of one mind on this matter, and that I am in a hurry. You'll be on the lake to-morrow?"

"I know that it's lucky for you I happen to be in an extraordinary good humor; and I won't be on the lake to-morrow. If I'm to put my men, as you call them, on a false scent, it's but common decency that I should go with them. And—hold on! I must tell you why I'm in a good humor, lest you should attribute my behavior to poltroonery. Elinor Golightley has half promised, or maybe three-quarters, to do—what do you think?"

"I haven't the least idea."

"We have hit upon the one thing he didn't know! Why, to be my wife. Oh! interested at last, are you?"

The expression of Garth's face and his entire

bearing had, almost in a moment, undergone a great though indescribable change. His lips parted; his eyes seemed to grow smaller; he leaned heavily on his walking-stick. But before Jack could speak again, he said, slowly,

"I never was more surprised. I don't know any thing for which I ought to be more glad." He held out his hand. "I didn't know that she and my uncle were parted yet. Jack, I'm glad for you with—all my heart!"

With the last words he gripped Jack's hand so forcibly that his friend winced and exclaimed, "You've got your muscle back, if not your cordiality. But as for that other affair, you know she never cared for him; and I, happening by good luck to come upon her at the right moment—Oh, Garth, dear old curmudgeon and friend of my youth, I am so happy! *Absit invidia*, as your uncle says, but you'll never be so happy as I am! No man ever will or was. Of course, you know, she hasn't promised, and thinks she never can, and all that; and, mind you, I wouldn't have breathed a syllable to any one except you about the affair; but—oh, do be enthusiastic, can't you? I would for you."

Garth laughed, stretched his arms and shoulders, and yawned. But when he saw a slight shade of disappointment on Jack's handsome face, he said, with that marvelous deep-toned tenderness which he rarely threw into his voice,

"I feel your happiness so much; that's why I don't say more, Jack. You know I was always a dumb beast. But you can not say so much for yourself as I can feel for you."

They parted, each going his way. Jack was appeased.

"Can the same Creator have made that man and his uncle?" he muttered to himself, admiringly.

CHAPTER XXII.

ICE AND FIRE.

THE morning of Christmas-eve was fine and cold; great white clouds drifted across the pale blue sky; indeed, the heavens presented so warm and summery an appearance that it was astonishing to find the earth snow-covered.

Elinor and Golightley were established in the back seat, Garth sitting in front with Madge to drive. The other sleigh held Mrs. Tenterden and the parson, together with a pile of baskets and hampers. "I declare!" exclaimed Mrs. Tenterden, as she bundled into her place; "what a pity Mr. Selwyn isn't here! He'd enjoy it so, and he's so lively."

At this the parson began to chuckle and rumble. "The young man would be lonely, ma'am. All the lasses are taken up, so far as I see, eh?—haw! haw! ho!"

Elinor looked down in painful embarrassment. When changes have been rapid and violent, they seem in the immediate retrospect like a dream. Was Golightley really no longer her betrothed? Was it possible she had listened to Jack, and half yielded to him? Or if so, why must the old forms and appearances, which now contained no life or truth, still be observed? Mrs. Tenterden and the parson represented the conservatism of society, before which all individual emotions and tumults must be still. They saw things according to ap-

pearance, not essence; and for their sakes what was real must be stifled and disguised. In the forms of life, it must always be the most shallow-minded and short-sighted who control.

At length they were ready to start, and as they drove away, Cuthbert stood in the doorway and waved them an adieu, while Nikomis's dark visage appeared in the background. Even Sam Kineo crawled stealthily to the attic window and peeped forth upon them; and when they were out of sight, he returned briskly to the wigwam, and began to prepare for his own part in the day's drama. Sam's star was once more in the ascendant.

Meanwhile the party arrived without accident at the lake, and found all the small boys of Urmsworth and a good part of the elders there before them. Garth sent off the boys in every direction in quest of fire-wood, and within half an hour there was such a bonfire on the nose of the islet as had seldom been seen before. The horses were now stabled in the shed, and Mrs. Tenterden and the parson were provided with an ample furniture of blankets and buffalo-ropes, and a luxurious position on the warmest side of the fire. Garth attended to the fastening on of the young ladies' skates: they were both dressed alike, in silvery gray trimmed with scarlet; and wide as was their divergence in feature and character, one might easily have been mistaken for the other at a hundred yards' distance, or in the dusk. Madge, however, was a highly accomplished skater, while Elinor was only able to perform the simplest evolutions. When Garth was ready, he and Madge skated off together, to the admiration of all beholders, and after making the circuit of the pond, they paused at the river opening to take breath. Presently Madge said,

"Garth, will you take my hand now, and skate down there, away and away, as far as we can see, ever so far beyond Wabeno; and then get on board a ship and sail to Europe—oh, Garth! and live there—will you do that with me?"

"If we had Sam Kineo's fifty thousand dollars, we might."

"What if I did have it here in my pocket!"

Garth was gazing absently at the distant mountain as she spoke, and did not turn to look at her. "Do you know," he said, after a while, "if Kineo had kept away till the 1st of January—a week from now—that money would have reverted to me? and then it might really have been in your pocket, and we might really have gone sweeping down there on our way to Europe!"

"Then I wish he had never come! Garth, it is not too late. You have the proofs. Let the thieves be taken; it would be right; and then we should be free! Will you, Garth Urmsen?" She spoke under such evident excitement that Garth's own heart caught fire. It was not too late, indeed. Public opinion, justice, and the law would bear him out. And he and Madge would be free; they needed freedom. How easy to grasp it!

But Garth had chosen his course when his brain was cool, and despite the intoxicating influence of the woman by his side, he held to his purpose.

"I won't do it, Madge!" he said, harshly and abruptly. But the harshness was not for her, but for his own infirmity.

"You always think of every body but me," she

said, while a shadow fell over her vivid face. "Heigh-ho! Well, let us go back to the fire. You ought to be at work catching your fish."

They skated back to the islet slowly and in silence; and for the next two hours Garth was busy cutting holes in the ice, setting lines, and pulling up perch and pickerel. A big kettle had been provided in which to cook the chowder, and every body had some hand in its preparation. By this time as many as a hundred people were scattered about on various parts of the lake, and a dozen rival cooking establishments had been set up. When the chowder was ready it was handed round in tin cups, to be eaten with iron spoons. Garth took his seat by Elinor, and they chatted together about diverse indifferent matters, until he said,

"I saw Jack Selwyn yesterday. He is the only friend I ever made, and he tells me secrets he would tell no one else. He told me what I was glad to hear, both for your sake and his."

"He did not say that we were—"

"No, no; he didn't magnify his hopes. I hope you'll find it possible to be kinder to him than you think you can be now. He loves you; and when you know him better you can't help loving him."

Here there was an interruption, and Elinor was left to herself. That Garth should have congratulated her on her new relations with Jack, affected her oddly. It was as if some one from whom, by a desperate effort, she had escaped, had suddenly come before her, serene and kind, and given her joy on the success of her attempt. She wondered whether he would have spoken so calmly had he known what others knew about Madge, and was angry to find herself so wondering. Perhaps he did know: evidently he was aware of his uncle's guilt, and if of that, why not of other things? But no—it was impossible. Moreover, had not Elinor herself promised to do all in her power to save Madge from the worst that was feared for her? and if that were accomplished, might not she and Garth be reunited even before they were separated, all be well with them, and Elinor the cause?

Elinor got impulsively to her feet and looked about her. Madge was some way off upon the ice, teaching a small boy the mysteries of the outside edge. Elinor came up to them and said,

"Won't you give me a lesson now?" and took her hand.

Madge looked surprised and on her guard, but offered no objection, and they skated away together. "You see it's very easy," observed Madge; "but I suppose you don't have so many chances to skate in Europe."

"Not many. Would you like to go to Europe?"

It was several moments before Madge answered, "I mean to go—some day."

"But would you like to go soon—with us?"

"Does your future husband approve of that invitation?" asked Madge, after another pause, letting go Elinor's hand, and sliding on with a wavy motion beside her.

"I meant with me and Mrs. Tenterden. I shall not be married. I have not told you that we have recovered most of our fortune."

Madge wheeled about and looked in Elinor's face. "So Jack Selwyn has let out his secret, has he?"

"It was Golightly himself who told me, Madge."

Madge laughed softly. "But what a funny invitation! Is it to part Garth and me? or is Garth to be of the party? or—would not Garth do without me?"

Elinor flushed with indignation, and half resolved to leave Madge to her fate. But her better will still overcame resentment.

"I thought you might like to see the world before you were married. We could introduce you to all the things and people that would give you most pleasure. You should go where your beauty and talent would be most acknowledged. It would be better than for you to go in—in almost any other way."

"But why do you ask me?" repeated Madge, coldly.

"Because you are a woman, and I am a woman. And no other woman knows what I know about you—what I found out by chance. I want to be a sister to you, if you will let me. I have felt what it is to be alone and in trouble—and in temptation. I longed for some one who would speak to me and be kind to me; and though I can do so little for you, Madge, still, if you can believe that I speak from no selfish motive, you may help me to do something."

Madge's expression abated something of its hardness and incredulity as she met Elinor's eyes. "You have never seemed friendly to me before," she said.

"I know it; I was always thinking of my own troubles; and you never seemed to need a friend before. I do wish to be your friend now."

Madge cast down her eyes and was silent. Suddenly she asked, without looking up, "Ought I to marry Garth?"

Elinor hesitated. She felt that Madge was testing her sincerity. But she could not prevaricate, even to gain her end. "Not unless you love him," said she.

"Let us skate on," said Madge, holding out her hand again. After a while she continued: "You do seem honest; and if you are honest, you are very kind. But you must not think I would do any thing foolish—put myself in any one's power. Perhaps I don't mean to marry Garth; but then I know now what I did not know a month ago—that he does not care for me. He would marry me from a sense of duty—which I hate. I don't expect to die of a broken heart about it; and yet I don't believe there's another man in the world as well worth loving as Garth Urmson. Don't forget I said that, Elinor. But I'm not fit for him. He is all that I admire in a man, but he is so much more besides that my part is crowded out of sight. So I should be happier with a lesser man, one more like Jack Selwyn, perhaps; only Jack happens to hate me—maybe he has reason to—and to be in love with somebody else. Can you guess with whom?"

She smiled as she put the question, and continued immediately: "But don't have him. Elinor, I thank you for having wanted to do me a kindness, and, in return, I'll tell you a most precious secret. Garth Urmson loves you, and has loved you ever since he first saw you. You must do the rest."

With the last words Madge curved gracefully aside on a smooth arc, and was gone.

The sun had set amidst a splendid wilderness of gold and crimson, scarlet and green; and as

the moon rose, dusk came on apace. The great bonfire was soon the centre of illumination; its red light flooded the ice, and the shadows of those who stood near it stretched out in dark rays until they were blended with the outer gloom. To those who sat around it and looked forth, the skaters who glided past and away again seemed like strange spirits come from another world to be visible for a moment in the light of this, and then to vanish for evermore. And as the night deepened, the unseen world grew vaster and more mysterious to the imagination, until the great roaring bonfire seemed none too great or too brilliant, since it was the only source of life and warmth left to mankind.

At length a request was made that Elinor should sing; so she stood beside the fire, with her hands folded in her muff, and sang one of those sweet, pathetic ballads that delight uncultivated ears as well as those which know true music. As she sang, a circle of auditors collected in a semicircle on the ice before her, leaving a wide open space between her and them, and every sound except the singer's voice was hushed.

Suddenly, in the momentary pause which followed the last verse, a new and strange figure swept upon the scene, as wild in his attire and motions as any night goblin of fairy lore. In figure he was tall, symmetrical, and graceful, and his lithe proportions were well set off by the close-fitting, fur-trimmed suit he wore. Round his waist was wound a long scarlet scarf, whose fringed ends waved out as he moved, and there was a bunch of scarlet feathers in his black fur cap. His black hair hung below his ears; his face was swarthy, and appeared, in the uncertain light, to possess a sombre and saturnine kind of beauty. Such an apparition had never been seen on that lake before; and the semicircle of auditors, now spectators, with one accord, widened out, so as to leave him ample space in which to cut his strange fantastic capers.

And certainly it can seldom fall to the lot of human eyes to behold such unearthly gambols as were here displayed. The mysterious skater seemed to be superior to the ordinary laws of gravitation. Freedom and boldness were scarcely terms to describe the graceful recklessness with which he tossed himself to and fro, in and out, now backward, now forward, weaving inextricable patterns, and wheeling out swift circles, all with such inimitable poise, ease, and finish as if he could lean upon the air and be supported by it. Meanwhile the red fire-light and the black shadow played over him so bewilderingly as to render any deliberate scrutiny of him impossible. He was a half-supernatural presence to many who saw him; to the questions whence he came or wherefore, there was none to return a reply.

"Good mercy! what is it?" exclaimed Mrs. Tenterden.

"The champion skater of the world," replied Garth, who had been watching the exhibition with an expression between a smile and a frown. "Would you like me to present him to you?"

"Good gracious alive!" cried the lady, folding her arms over her breast with a shudder of dismay; "it would scare me out of my life. Why, I would as soon think of being introduced to a mountebank in a circus."

While this short conversation was going on, Elinor, who had remained standing precisely

where she had first taken up her position, saw Madge press through the outer ring of on-lookers, and beckon to her with head and hand. Fearful of she knew not what, she quietly slipped aside, and skirting along the outside of the groups, came at length to the point at which Madge had appeared. But Madge was no longer there. At the same time she noticed that the unknown skater had brought his evolutions to an end, and had vanished as suddenly as he appeared.

At last, not without a certain pressure of anxiety in her heart, she returned to the fireside, after nearly a quarter of an hour's absence. The parson was telling some vastly humorous story, to which Mrs. Tenterden was listening with chuckling good nature; Garth had gone to the shed to give the horses a feed of hay, and Golightley was sitting with his toes to the blaze, apparently half asleep. An air of comfort and security dwelt upon the scene, entirely inconsistent with any apprehension of danger; and Elinor allowed the parson to bring his story to a conclusion, and to bellow forth more than one peal of Homeric laughter at it, before she alluded to her misgivings.

"I've been looking every where for Madge," she said to Mrs. Tenterden. "Have you seen her lately?"

"Madge? Why, yes, to be sure I have," replied the good lady. "I saw her out there not five minutes ago; and she's been in sight, off and on, ever since that horrid black creature went away."

Greatly relieved, Elinor sat down on a buffalo-robe, and realized for the first time how tired she was. Ten more minutes passed away. All at once a thought flashed into her mind that brought her to her feet as lightly as though fatigue were a thing unknown. Garth had just left the horses and was coming toward her. She beckoned to him, and led him out a little way on the ice.

"Have you seen Madge lately?" she asked.

"I saw her just before I went to feed the horses," he answered.

"Who was that—who was skating here?"

"Oh, the champion skater of the world," he said, smiling.

"Tell me if it was Sam Kineo?"

Startled by the vehemence of her manner, Garth admitted that it was. "But it is to be a secret," he added. "It must have been his foolhardy vanity that made him show himself in that way. The understanding was that he was to slip off as privately as possible."

"I'm afraid something has happened," said Elinor, with an irrepressible trembling. "You know Madge's dress and mine are alike; I'm afraid you mistook me for her. I looked every where for her and could not find her. I'm afraid—"

"Well, I guessed you couldn't be Miss Danver this time," said a voice close beside her. "I guess even she couldn't skate quick enough to be back here 'fore I was."

"Have you seen Miss Danver?" asked Garth, with a singular gentleness in his tone.

"Yes, but she's 'way off by this time, I guess," replied the small boy, sticking his hands in his pockets and tucking his chin inside the fold of his tippet. "I see her and that skater chap with the red feathers in his cap; they was goin' it, I tell you, 'way down there along the river."

He scrambled away, and the eyes of Garth and Elinor met. "Shall you take any one with you?" she asked.

"No; if I can't do it alone, no one need help. Say nothing. Better get the people to go home. I sha'n't be back for two hours—perhaps more. Good-by, Elinor."

"Good-by. God help you, Garth!"

She stood listening to the ring of his flying skates until the sound died away; then she returned to the fire, faint and sick at heart.

The sky was overcast with great clouds, between the rifts of which the moon looked forth at intervals, and flooded the valley with cold radiance. Garth, as he went skimming with long sweeps toward the south, peered with intense gaze into the gray night ahead, but the alternations of light and shadow rendered it especially difficult to distinguish objects at a distance. It was unlikely that he would see those whom he pursued until he was close upon them, and the overflow of the river having broadened it to nearly half a mile, he had to guard against the chance of passing them.

As he sped onward, his mind busied itself with a review of his relations with Madge from their first beginning. If, as seemed certain, she was a willing companion of Kineo's flight, the plot must have been arranged, in some form or other, long ago. They must have been in communication not only since the half-breed had been concealed at Urmhurst, but during the years of his absence abroad; and if so, then their intimacy even in childish days must have been far closer than Garth had ever imagined it to be. In that fight of his with Kineo—could it be that Kineo, and not he, had been in the right? Recalling each one of Madge's well-remembered looks and words on that occasion, they now appeared under a new aspect. Had she been false even then? Had he been made a fool and a laughing-stock all his life long? The blood burned in his cheeks at the thought, and his eyes sought fiercely through the gloom. The hour of reckoning had come. He flew onward like the very spirit of retribution, and the hollow ice resounded beneath his steel-shod feet.

Until now he had not considered how he would deal with them when overtaken. Would Madge, having taken this step, return at his command? Would Kineo easily relinquish her? Garth clinched his hands and his teeth, and all the imperious, relentless temper of the hot-hearted Urmsons throbbed within him. Vengeance was his—he would repay; or if God's, then was he God's chosen instrument. There should be no parley nor pity now; there had been too much already. Kineo had gone to the end of his tether; his punishment should be quick and final. Madge had tempted mercy until there was no mercy left; she should not die, but he would hold her up to the shame and scorn which were her due. As Garth swept forward with heightened speed, he cursed the icy miles that hindered his revenge. He felt in his belt, where hung the small sharp ice-hatchet with which he had that morning cut holes for fishing. It was his only weapon, but it was enough. His purpose was deadly enough without a weapon. Any other man than Garth would have said, "Either I or my enemy must perish;" but Garth did not admit the alternative. The might of his anger

made him invulnerable and irresistible. He could not perish until he had worked his will. Had not his forefathers, one and all, defied fate, as he defied it now, and conquered?

But what had they conquered, and what had the conquest gained them? Had not Garth's own father warned him? In their victories they were cursed! Had all his boyish struggles and self-discipline brought him only to this? Were his mother's love and trust to be thus justified? Had he dreamed that night beside the spring to no better purpose than now to cast aside the sad and fatal lesson of the Urmson generations, and stain himself, likewise, the last of his race, with blood? Should that old murderous demon triumph over him as it had triumphed over the rest, and make the blot which had thus far marred their name eternal? As he cleft his way onward through the cold still air, two spirits seemed to move beside him, on the right hand and on the left. One wore the mien and features of that old Puritan ancestor whose hands had laid the granite threshold of Urmhurst above the sachem's grave; his chin seemed bloody from a recent wound, and the black frown that lowered over his eyes rendered more sinister the grin which twisted back his lips. The other spirit showed the lineaments of Garth's mother.

How, then, did he know that Madge had been always and altogether false to him? Had she, at least, never striven to be true? And if so, had he been always blameless for her ill success? That very afternoon she had urged him, with a vehemence which now he could understand, to take her hand, and accompany her on that same journey which to-night she was beginning with a different escort. Beyond a doubt she had hesitated in her purpose even so lately as this, and had needed only sympathy and encouragement to draw back. But he had answered her curtly and ungraciously. And if he had been unsympathetic then, how many times had he been so before? Those years of his in Europe—were they guiltless of what was happening now? And those long months of dullness and delay since his return, in which he pattered between action and inaction, right and wrong—during that time how many golden opportunities to woo and win her had slipped away! Could he not have been man enough to be at once all that she desired and all that he desired for himself? If not, was it wonderful that Madge, vivid and restless, should have fled from one so paltry, selfish, and one-sided? He had worn her out and driven her away even while hugging himself for his virtue in keeping faith with her when his heart called him elsewhere. Did he well, then, to be angry because the cup himself had filled was held to his lips?

Onward still he swept, and the pace must have quickened, for the grim spirit of the old Puritan was now outstripped. Blessed be the miles of barren ice that had hindered his revenge! Nor were they barren, since they had brought forth this fair fruit in him. He loosened the hatchet from his belt, and swinging it from right to left, sent it whizzing and spinning far across the glassy surface. "I'll succeed, if God pleases," he muttered, aloud. "Let the devil's part go." It was better to save than to avenge; but Providence knows many ways of saving, and that which seems the speediest is not always so where wayward human souls are concerned.

Nearly an hour had now gone by, and the moon, looking down through a cloud rift upon the long-drawn icy surface, saw three figures hastening along it, two in advance, and one pursuing, and the space between pursuer and pursued grew constantly less and less. At length the latter, being within about a quarter of a mile of an old wooden bridge, came to a stand-still, and the man knelt to repair the buckle of his skate strap, which had just given way. The woman, after watching him impatiently a while, threw herself down on the ice near by, and looked back toward the place whence she came. Suddenly she crouched low, laying her ear against the frozen surface; then she started to her feet, with a low exclamation. She had heard the ring of steel approaching fast. The man, too, arose, with a fierce curse, crippled, one skate in his hand.

"Give me the money—quick!" said he; "it's you they're after."

There was not time. The pursuer was upon them. As he emerged out of the gray indistinctness, he struck the heel of his skate into the ice with a harsh grinding sound, and halted between them, breathing deep, his forehead beaded with sweat.

"I'm come for you, Madge."

She stood silent, mechanically clasping and unclasping her hands. Her companion, after glancing up the river to see whether no one else were following, took his stand in front of her.

"It's man to man here," said he. "We'll settle it now, Garth, once 'nd for all; and she'll stick to the winner."

Garth moved round him without answering. "Come, Madge," he repeated. She only shrank a little backward, still silent.

"Just you let her alone," said Kineo. "It's me you've to do with. She's always been my girl: only 'mused herself with you till I was ready for her."

"Be off!" growled Garth, suddenly turning his face upon him. "You liar!"

"He tells the truth, Garth," Madge said. "He kissed me that day at the picnic, years ago, though I denied it. And that night you ran the rapids I was going with him, only seeing you changed my mind. But I sha'n't change any more; I shall not come back. You needn't be anxious about me, nor regret me. I'm glad you know me for what I am at last. I liked deceiving you at first, but I'm tired of it now. I'm going where I can be my real self."

There was no passion in the girl's tone, but a fatal apathy, as of one with whom all moral struggle was definitely over. She did not avoid Garth's look, but rather sought it with a kind of listless directness that was appalling. The truth that she had spoken, ugly though it was, had the power inherent in all truth. Madge had never been stronger than at this moment of frank degradation.

Garth had no argument to offer; he could only put forth his will, of the strange force of which he himself was, perhaps, but partially aware. "You must come," he said to her, with the quietness of intense resolve; and though she still shrank away, he glided forward and put one hand upon her wrist.

As soon as she felt his touch all strength seemed to ebb away from her; she sank down on the ice, and bowed forward, relaxed and nerveless. Her very eyelids drooped, as though heavy

with drowsiness. Vigorous as she had been to escape, she was powerless to move one step in return. Garth could stop her flight, but his will could not compel active obedience. It could deaden, but not vivify.

He knelt beside her and strove to rouse her, but she only murmured indifferently, turning away her face. Then Kineo, who had watched the scene with an interest sufficient to restrain him from taking part in it, laughed jeeringly.

"You let that woman alone now, Garth Urmsen," said he, "and get up 'nd defend yourself like a man, or, by the devil, I'll brain you where you are!"

"I told you once to be off!" returned Garth, looking up at him grimly.

There was a ring of menace in his tone, yet he had made no threatening gesture. But with a sudden snarl of rage, the half-breed raised the skate which he had been holding in his hand, and dashed it in Garth's face. The sharp edge of the steel struck his chin and cut a deep gash there. He leaped up and closed with his antagonist. Then Madge sent forth a wild scream, and started to her feet likewise.

In a moment the men reeled and fell, Garth uppermost. Kineo groped savagely for his knife; Madge saw and snatched it, and put it into Garth's hand. He poised it over Kineo's throat for an instant, but then tossed it away. There were shouts, and a resounding of the ice from the direction of the bridge. Madge held her breath to listen: it was Selwyn's voice; and yonder they came—three of them. Quick as thought she turned to Garth, who was still holding down his half-stunned and breathless enemy.

"Don't let me be shamed before them," she said, hurriedly. "Let me go back alone, and be there before you. Then no one need know. Garth, may I?"

The men were approaching; there was no leisure to deliberate. "Yes."

She lingered yet a moment. "Say you forgive me!"

He looked at her without speaking; his face was ghastly, smeared with blood, but she fancied she saw what she asked for in his eyes. She had asked for it; yet in that very petition had lurked the deepest and last deceit of all.

When Selwyn came up, Garth and Kineo were alone. The former rose and looked at Jack angrily. "Is this what you promised?" demanded he.

"I took pains not to promise. But—is this the whole convoy?" He indicated Kineo with his foot.

"This is all."

"Why, then," exclaimed Jack, cheerfully, though not until after a moment's pause for consideration, "so much the better. Truss him up, boys."

"Let him go," said Garth. "I am responsible."

"I'm not going," said the half-breed, with sullen malignity. "You've put up this job between you. You meant to let me off after the woman 'd cleared out with the money. I'm not going. I'll let 'em hear who I am, 'nd what I know. You've got me, 'nd now you'll keep me."

"Oh, any thing to oblige you, if you're sensitive about it," returned Jack, with a laugh; and the prisoner was secured accordingly.

Madge had skated northward a quarter of a

mile; then she swerved to the left, and in a few hundred yards reached some low clumps of bushes on the verge of the ice. Behind these she crouched down and waited. By-and-by the little group came past, Garth in the rear of all, moving heavily and wearily. She watched him with wide-open, straining eyes, until he had faded into the shadow of night and out of her sight forever. Then she arose, and skimmed swiftly back toward Wabeno, and toward the great world, which she loved so well, beyond.

CHAPTER XXIII.

BROTHERS.

SHORTLY after Garth's unnoticed departure from the lake, Golightley had roused himself from his semi-stupor before the fire, and without speaking to any one of his intention, had set out for Urmhurst. There was a kind of solemn alertness in his bearing, very different from his general manner during the past few weeks. He seemed to take pains not to let any of the wintry beauties of the night escape him: several times he paused to watch the clouds drift across the moon, or to mark the black tracery of the branches against the sky. Once he picked up some snow, and having made it into a snow-ball, aimed it at the trunk of a pine-tree, repeating his efforts until he hit the mark. He took off his hat, and let the night air blow upon his forehead, and at two or three points of his route he stopped to look around him, as one might do who wished to impress upon his memory a scene he expected not to see again.

Two of the Urmhurst windows were alight—that of Cuthbert's study and of the kitchen. Peeping through the latter, Golightley saw an oil-lamp burning on the table, but the room was empty. He passed round to the back of the house, and entering noiselessly, took a candle from the dresser, lighted it, and descended into the cellar. Picking his way amidst the barrels and rubbish which encumbered the floor, he came to the wall at the southern end, and was about to loosen some bricks, when the sound of steps overhead made him pause. The next moment he had concealed himself behind some empty barrels, and put out his candle. Nikomis was coming down the cellar steps.

The old Indian came hobbling along, lamp in hand, and stopped at a place about ten feet from where Golightley was hidden. Mumbling to herself, she took up some boards from the floor, and groped beneath them, her breath showing mistily on the frosty air as she stooped and muttered. Having laid hands on what she wanted—a bundle of papers, apparently—she replaced the boards, and hobbled away again. Golightley waited until he had heard her steps cross the kitchen and pass out of it, and then he relighted his candle, lifted the boards, and saw, in the hollow underneath, the old pewter warming-dish which he had concealed in the sachem's grave more than twenty-five years before. He opened it eagerly, and there was the triangular parchment, with its seven broken seals. Nikomis had discovered it in its former hiding-place years ago, and had transferred it to this *cache* of her own, where it would have been forever lost to Golightley had he not happened to be a witness to the Indian's opportune revelation.

He put the parchment in his pocket and crept back to the kitchen, and thence to the upper floor. Nikomis and Cuthbert were conversing in the study; Golightley stood still on the landing for a minute or two, debating with himself whether or not to enter and bid his brother good-night. He finally decided against it, and went into his own room—Eve's old chamber—on the other side of the passage.

A cheerful fire was burning on the hearth, evidence of Cuthbert's kindly forethought. Golightley stood before it, and taking out the parchment, held it toward the blaze. Just as the flame reached it, however, he snatched it back again. This performance he repeated several times, apparently daring himself to burn it outright; but his daring not being at the sticking-point, he finally abandoned the idea, and laid the parchment on the table. He then threw off his clothes, bathed himself from head to foot, and arrayed himself again in elaborate evening costume, finishing by scenting his handkerchief and drawing on his neatest pair of patent-leather boots. This done, he sat down at his table, took out writing materials, and wrote rapidly for more than an hour.

Cuthbert had spent the afternoon in his study, looking over and arranging the manuscript pages of his history. The work, the labor of a lifetime, was still incomplete, and no one who had beheld its author's emaciated figure could have doubted that it must, so far as he was concerned, remain so.

"It's been a failure in the same way my life has been," he murmured to himself. "There are good passages in it, and the plan of it was not altogether amiss; but Heaven hasn't thought it worth while to furnish me with such odds and ends as alone could have rendered it an effective and intelligible whole. As it is, it had better perish—the manuscript, I mean. Ah me! why didn't I concentrate all my wisdom in some *Æsopian* fable about mice or chimney-swallows, which children might have learned by heart, and sages have quoted three thousand years from now! That had been a worthier fruit of sixty years, methinks, than a handful or two of ashes. Well—here goes!"

With these words, he took the thick pile of manuscript from the table and placed it, not without a certain half-playful reverence, amidst the burning logs of the fire-place. Then, with his cheek upon his hand, and an occasional smile stirring the corners of his mouth, he sat watching until the busy flame had mastered every page of the famous history. "That was easily done," he said at last. "If all mistakes and shortcomings could but be so comfortably rectified! If free murder and suicide were not immoral, what a blessing they would be!"

"And now I should be having my business interview with Nikomis," he continued, after a long interval of still meditation. "She must receive new evidences of my claims to witchcraft, though she could hardly expect me to be more than formally unconscious of her precious grandson's presence here, and of the cause of it. But it's amusing how all these good people walk on tiptoe and lay their fingers on their lips when I appear, in order to spare me the pain and shock of knowing secrets which I divined long before they did. And I solemnly accept my *rôle* of deaf, dumb, and blind! But I must declare myself now, since a

week hence Master Kineo, though he were the most deserving young man alive, would be too late for his legacy. I trust the old lady has been provident enough to keep the marriage and baptismal certificate, and that she'll be reasonable enough to see that an inconvertible annuity is the only chance of preventing my unlucky nephew's wealth from plunging him into worse mire than he wallows in now—if there be worse! But I must make Garth promise to take him in charge, and put in a guiding, helping, or restraining hand as chance and opportunity may require.

"My beloved old Hottentot! I think I see a possible way out of the woods for him. He shall not marry naughty Madge; indeed, I think she herself is neither quite naughty nor quite unselfish enough to let him. But when I have let out the vials of my anger and exhortation upon the head of that most shameful and unhappy brother of mine, then Elinor will be free; and if Garth can not manage the rest, he is more faint of heart than I take him to be.

"But poor, vain, feeble, pathetic Golightley! what shall become of him? If my life could be of any service to him, he were most welcome. But that is absurd. Yet what a pity it seems that, since the only thing I can hope successfully to achieve in this world is a speedy getting out of it, I should be unable to benefit any one thereby! I have no fortune to bequeath, no forlorn hope to head; I'm not even in any body's way, except my own. Well, well, I won't grumble; I'll be my brother's friend until this flesh has melted, for I fear he won't find many to take his part after I am gone.

"Ah me! now comes my pain again. What a thorny path is this that brings me to thee, my own gentle Cotton Martha!"

While Cuthbert was passing his dark hour of physical anguish, Kineo was having his final interview with Nikomis, in the course of which he made use of every argument, threat, and persuasion that he was master of to induce her to reveal to him the hiding-place of his certificates, but in vain. At length, time being of value and physical coercion impracticable, he was fain to give up the attempt for the time, promising himself to renew it at some more favorable occasion; and, after all, he had the money, which was something. When, therefore, Cuthbert and Nikomis spoke with one another, a few hours later, it was to issues somewhat different from what the former had anticipated. They did not hear Golightley come in; but the new aspect of affairs made Cuthbert so anxious to see him at once that at length, by way of beguiling his suspense, he crossed the passage and opened the door of Eve's chamber. Nikomis had followed him.

Golightley was standing in the middle of the room, with his back to the door. He was clad in full evening dress. On the table beside him were some written papers, neatly arranged, and an open parchment. In his hands he held some object. Cuthbert could not at first see what it was, but instinctively he glanced up at the wall above the fire-place. Captain Neil's old pistol was missing from its accustomed place.

Golightley raised the weapon, his left hand grasping the barrel, while his right was on the lock. The muzzle was aimed at his breast.

"Brother!" cried Cuthbert, and hurried desperately forward.

With a great start, as of one whose nerves had been wrought up almost to the pitch of madness, Golightley turned partly round, and at the same moment his thumb tightened convulsively on the trigger. The pistol exploded; the ball grazed his own shoulder and buried itself in Cuthbert's heart. And Cuthbert, with only a sigh as of a tired child dropping asleep, fell forward on his face, never to suffer pain of mind or body any more.

Elinor, Mrs. Tenterden, and the parson had driven home from the lake in the latter's sleigh, and he, after wishing them both a merry Christmas and a happy New-Year, had left them at the door of the Danvers' cottage. But Elinor could not rest; and after Mrs. Tenterden had recalled and found amusing every incident which had come under her observation during the day, and had then gone comfortably and peacefully to bed, Elinor put on her jacket and hood, left the house, and walked swiftly along the white woodland path to Urmhurst.

Garth, on arriving with Selwyn and others at the lake, had found it deserted; so on the supposition that Madge must have accompanied Mrs. Tenterden and Elinor home, he separated from the party, who were bound for the village, and struck off through the woods alone. Thus it happened that he reached the porch of Urmhurst almost at the same moment with Elinor. They stood hand in hand an instant; then both asked the same question:

"Where is she?"

Garth's fingers relaxed their hold, and his arm dropped to his side. He saw the truth instantaneously. "Oh, Madge!" he muttered, in a dull tone, "I trusted you—for you asked my forgiveness!"

Before Elinor could speak or entirely comprehend, a sharp, violent noise from within the house smote upon their ears. Garth raised his head slowly. "Who is in this house?" said he.

"Your father and Nikomis, and—perhaps Golightley," replied Elinor, trembling.

"Take my hand. Will you come?"

She could reply only by a tightening of her slender clasp. Garth threw open the heavy door with a kind of fierceness, and they went in. "It may be nothing," said he. But when they reached the foot of the stairs, an invisible warning met them—the faint odor of burned powder. Garth halted a moment, and Elinor heard him take his breath between his teeth; then they went up together and stood on the threshold of Eve's chamber.

Nikomis was sitting on the floor, with Cuthbert's head on her knee, and parted back the gray hair from his forehead with her dark knotty fingers. His eyes were half closed; Elinor and Garth knew at once that he was dead. Golightley, in his evening dress, leaned against the table. He held the pistol by the barrel in his left hand; with his right he was tremulously adjusting his eyeglasses. His expression was of stupid annoyance—nothing more. On the quiet air still hung a thin veil of smoke.

Garth relinquished Elinor's hand and came forward, fetching his breath with a slight gasp at each respiration. He stood facing Golightley for what seemed a long time without a word or gesture. At length he extended one arm, and waved the open hand toward his uncle, as if mutely to attract his attention.

Golightley stared at him blankly at first. Then he moved himself uneasily, and said, in a voice that had no substance in it, and yet was not a whisper,

"The clumsiest thing! I should have oiled the lock. I was very nervous, and his coming in and speaking suddenly made me jump. I missed myself, by George, and—"

His glance, wandering restlessly about as he spoke, lighted at this point upon the solemn whiteness of the dead face, and became fixed there. The pistol slipped from his hand and dropped heavily to the floor. He stood upright, and seemed like a man awakening. Suddenly he tossed up his hands, and quavered out, piteously, "I killed him! Oh, my brother! He's dead. The only man that would have forgiven me! I shall never be forgiven now!" He knelt down by the table and laid his head upon it, sobbing.

Garth had not yet moved from his position, or spoken. But Elinor, having brought a cushion and put it beneath Cuthbert's head, and drawn Nikomis and Golightley silently from the room, came and stood before him, with such a look of divine sympathy and compassion as Garth never saw on any human face but hers. "Your father would have forgiven him; and you will forgive him—soon!" said she.

"Thank you," he answered, replying to the spirit rather than to the words. Her eyes brightened through the tears that stood in them; and thus she left him, alone.

On New-Year's Eve there were three friends of Garth's sitting round the kitchen fire, and discussing the events which had lately taken place. It was morning; breakfast had just been taken, and Garth had gone up stairs to make his final preparations for a journey.

"I'm not likely to tell him so," observed Jack Selwyn, taking up his knee between his clasped hands, "but I don't mind telling you, professor, that I'm entirely against the whole idea. In the first place, he won't find her; then, if he does, she won't come back with him; and finally, if she does come back with him, it will only make them both worse off than they are now."

"I think he is right to go, whatever happens," said Elinor. "He could never rest until he knew there was no more hope. And if he should succeed, Jack, you would not say then that it was the worse for them."

"Ay, ay, Miss Elinor, I'm of your mind," said Professor Grindle, folding his arms, and nodding his thick eyebrows at her approvingly. "It's well each man and woman of us should do our best and utmost before leaving any thing to our Creator. That's what my dear friend Urmson's plan was through life; and he was the worthiest man I ever knew."

"I think Garth will be up with him, though, before he's done," remarked Jack. He looked at Elinor as he said it, and she rewarded him with a smile. But the smile, after he had meditated upon it for a while, cost him a sigh.

"What about that scamp Kineo?" inquired the professor, after a pause. "There was not evidence to convict him on that charge, I understood."

"Not on that charge—no; for Garth, having paid ten thousand pounds for the proofs, seems to have thought himself entitled to burn them;

and it's my opinion he lit the bonfire on the lake with them. But the devil does sometimes attend to his own; for Mr. Kineo, having been locked up on a three months' sentence in Haverhill jail for a petty felony committed a year ago, undertook to make his escape, and being forcibly remonstrated with by one of the jailers, he so mauled the poor man that he died yesterday morning; and that will be manslaughter, and fifteen years, at the very easiest. I can't help being rather pleased, by-the-way, at Miss Madge's having got off so neatly with that legacy of his; it must have inflicted a bitter pang upon his manly heart; and since Garth wouldn't have condescended to touch the lucre under any circumstances, there's no great harm done so far as that goes."

"But the other—Golightley—is going to Australia, I'm told."

"Something of that sort, I believe," said Jack, indifferently. Elinor looked up and smiled again, and this time Jack blushed.

"'Tis a strange thing, if it be true; but I believe," continued the professor, musingly, "that if any thing can redeem that poor wretch's soul, it will be his having slain his brother at the moment when he sought his own life. And Cuthbert, I'm well assured, would willingly have laid down his life for such an end. Indeed, it was a blessed release to him in any case. With that disease he had, he could have held out but a few months more, and died in lingering pain at last. But, as it was—just one heart throb, and then—rest." The professor's throat swelled, and his eyeglasses became misty.

"But I shall never forgive that—" began Jack, but checked himself at a grave look from Elinor, and the next moment Garth came in. He held a fold of papers in his hand, and wore a long top-coat, with a cape to it. Standing by the fireplace, facing them all, his square, impressive visage and figure filled the eye of the beholder and satisfied it, as a portrait by Rembrandt might do, only that Garth was no portrait, but a reality.

"Before I go," said he, "I want to tell you what I found in this letter, which my uncle wrote in his chamber on Christmas-eve. I read it for the first time this morning. You remember, Elinor, that ghost story he told us here the first night he came? It was a veiled confession, characteristic of him. The parchment he really found and hid as he described then. It was the marriage lines of Maud Golightley and Brian Urmson, dated at Jamestown, in 1781. Their marriage was a secret one. You know what followed, and how each heard of the other's death, and each married again; but the second marriages were no marriages, and the children of them—my father and Mrs. Tenterden—were illegitimate."

"Ay, that explains what I never comprehended till now," interposed Grindle, throwing one knee across the other: "why Maud should have left her home and her people, after so many years, to seek out a man who had caught her maiden fancy, and whom she'd never seen or heard of since. But her being actually his wife—ay, that's another tale. But proceed, Sir; let's have the rest of it."

"It's worth telling only as it bears on my uncle. Maud, when she came North, left her fortune to her illegitimate daughter Mildred; and

my grandfather Brian, when he made his first will, bequeathed his property to my father. Maud had always kept her first marriage lines; but she and Captain Urmson agreed never to speak of that which would discredit their innocent children. However, Maud died somewhat suddenly, and the marriage lines were lost and forgotten, until my uncle found them, and learned, as he writes here, that the inheritance of Urmhurst belonged by right to him, and not to my father.

"And then, instead of either confronting the captain with the record or burning it up, he hid it, not intending to make any use of it, so far as he knew, but enjoying the secret sense of power it gave him. Probably he hadn't the courage to challenge his father face to face; besides, his intentions were always good; but if ever a man paved hell with such things, he did. He lived brooding over his secret, and growing more and more sly and deceitful and hypocritical every day, and he lost all habit of frank speech and thought. It's piteous to think of."

"His Doppelganger. Poor Golightley!" murmured Elinor.

"Yes; poor fellow! Well, then, when the captain read his will to him and Cuthbert, giving him but ten thousand dollars, he said to himself, 'If I had my rights, it would all be mine.' But even then he did not speak out, but went off with his money to England, never meaning, as he writes here, to ask for more. But when he got into difficulties abroad, he thought, 'If I write to my father that I know his secret, he would send me money rather than Cuthbert should know. I'll do it this once.' It was that letter which put Captain Brian in such a rage; but the money was sent; and so it went on year after year, my uncle deteriorating more and more, because he had, as he puts it here, found an honest way to be dishonest.

"Now you can see how it would be, Elinor, when he and Mr. and Mrs. Tenterden met. 'All this fortune rightly belongs to me,' he thought, 'for I am my mother's only legitimate son; she defrauded me in giving it to Mildred.' Of course property can be bequeathed as the testator chooses; but there was just enough fanciful justice in his claim to make a scoundrel of him. He dallied with the thought, and afterward (when it came to that) with the temptation, until—well, you know how it ended. But I think the man ought to be deeply pitied, not condemned. There's no spectacle more pathetic than that of a poor wretch busily smearing his soul with such sophistries all his life long, and finding out at last that what he fancied was an elixir against harm was the most fatal of poisons."

"I think there must have been times when he partly realized that himself," observed Elinor. "You know he said of himself, in his story, that his sin was so subtle as to vanish beneath a direct look, or put on the appearance of a virtue; the only thing that betrayed the cloven hoof was the doubt—which he never could quite get rid of; and that the Doppelganger, while ostensibly his best friend, was really vitiating his soul all the while, and would at last destroy him."

"Well, there may be a white spot left somewhere on his moral carcass yet—I hope there is, with all my heart!" exclaimed Jack. "I should have liked him better, though, if he had burned up those marriage lines, when he made up his

mind to try another world, and never said any thing about them."

"He could not bear to die without having put his poor excuse before the world, so that it might do him such poor justice as he could claim. And he writes here that he did try to burn it that night, but his heart failed him. Well, I didn't mean to make so long an address; but you know what I mean."

With these words, Garth thrust the folded papers into his pocket, meeting the eyes of each of his three friends in turn, and in all he read the silent acknowledgment of his appeal. "Now I'm going," he said, after a pause.

He shook hands with the professor and with Jack, who, after the manner of men, tried to make the heartiness of their gripe compensate for the barrenness of their parting words. But Elinor said, "God help you, Garth!" as she had said it in the fire-light on the frozen lake a week before.

As he stood under the porch a few minutes afterward, the jingling of sleigh-bells was heard, and the venerable parson drove up. He had officiated at the funeral the day before, and was come this morning on purpose to see Garth off. He had, however, entirely forgotten both these circumstances during his drive through the cold sunny air.

"What, Garth lad! where are you off so early!" he bellowed forth, in his most jovial thunders. "Going courting, I suppose, eh? ho! ho! ho! Well, you'll find her at the cottage, I suppose; though, now I think of it, I've not seen Maggie for the last day or two. Well, good luck to ye, dear lad, and a happy New-Year! Oh, ay! you young folks think all your New-Years will be happy ones; but I guess you'll be none the worse off for an old man's blessing, whether or no, eh? haw! haw! haw!"

And with that mighty laugh and Godspeed in his ears, Garth started on his quest.

CHAPTER XXIV.

THE WAY OF THE WORLD.

NINE months later Garth was packing his trunk in his hotel room in Paris, when a card was brought up, and the person whose name it bore was but a few steps behind.

"Garth, dear old boy!"

"Jack!"

"What are you doing there?"

"I'm starting for Vienna. How long have you been over here?"

"Not long. Why to Vienna?"

"I've not found her here, but—"

"I know you haven't."

Garth looked up.

"Because I found her myself yesterday," added Jack. "I say, don't look at a fellow that way, old man. I've done you no harm."

"Does she know I am here?"

"Yes. She's been playing hide-and-seek with you, Garth. You'll never meet her. She won't see you—that's the long and short of it."

"Where is she?"

"I don't know where she is now; and I wouldn't tell you if I did!"

Garth's face slowly darkened; but Jack, with

tears springing to his eyes, came and sat on his knee, and threw one arm across his shoulders.

"Just listen to what I've got to say, will you? and don't break my heart by sticking that cursed obstinacy of yours in the face of God's providence! I tell you there are some things no man can do, and this is one of them. Look here! the—confounded woman's married!"

"Is that the truth?"

"I shall tell you no lies, Garth Urmson. Of course she's married, man! She's not such a fool as— As to who her husband is, that's of devilish small consequence; some infernal Dutch baron or other. She's living a life you'd as well not inquire into; but it might have been worse. She has what she bargained for; if she don't like it, it's a pity. She's the finest woman on the Continent, past the ghost of a doubt; but—well, she wishes you to leave her in peace. You can't do any thing—you simply *can not*!"

Garth sat long, gazing straight before him, his hand clutching amidst the hair that clustered on his head, as Selwyn had so often seen him do, when deep in thought, at college. At length he said, scarcely audibly,

"Well!"

"I'll step out on the balcony and smoke a cigar while you're—unpacking that trunk again. Then I've something else to tell you."

"No, I don't need to be alone to tear myself for rage and disappointment," said Garth, holding him back with a smile. "I've done my best; now I give it up, and there's an end of it. May God bless her!"

"Amen! though she is the devil!" muttered Jack.

"I can guess what your other news is, my dear fellow," continued Garth, pleasantly. "You're going to be, or perhaps are already—"

"Let me tell my own news, will you? I'm engaged!"

"Is that your idea of news?"

"It is news. I'm engaged—not to Elinor Golightley, mind you."

"Selwyn—"

"Let's look at him. Is he most shocked or pleased? Shocked, of course. Well, the name of the new young lady is Bellona, Goddess of War! You've heard of her; we used to read poetry about her in college."

"Jack, tell me what you mean."

"Well, I don't know that it's much to my credit," said Jack, with rather a sad laugh; "but it's this way. Elinor Golightley is beyond me. She strikes notes I can never reach, tiptoe as I will; and if the love I've felt for her can't make me reach them, why, nothing will. I give it up, as you say. She said to me nine months ago, 'You don't know me; you shall have the chance to know me, and then—' I should be a selfish brute, and a fool too, if I married her. I'm not generally given to running myself down, but she's beyond me—and beyond any man I know—except one."

Garth covered his eyes with his hand. Jack continued:

"I was a blind donkey not to have seen it from the beginning. But for the Golightley muddle I think I should have seen it. She loves you, and has always loved you. You love her, and have always loved her. You were born and grown for each other. Bless you, my children! This is ir-

regular and premature, of course, and, as Aunt Mildred would say, I'm perfectly scandalized, my good fathers, I do think in my heart—well, did you ever, now! Garth, shake hands."

All this gay rattle could not blind Garth to the brave reality beneath it. He knew that his friend was making for him the dearest sacrifice that friends can make; and though he had discovered on that night of death at Urmhurst that a sympathy and mutual comprehension existed between him and Elinor, such as can exist only between those whose spirits are tuned to the same great pitch of love, yet he blenched at the thought of taking the bread of life from the mouth of this too generous recusant.

"I'm too deep in debt already, Jack," said he, shaking his head. "I can't take such a gift even from you."

"That will do very nicely in the way of graceful embarrassment and deprecation. Now go in and win! Take her from Mrs. Tenterden, if you're so delicate about your old friend. Or, if you do really prefer to go back to your stuffy old studio without leaving a card at the Grand Hotel, number one hundred and twelve, why, of course, you must please yourself. As for me, I'm going to buy a red shirt and be off to my general in Italy forthwith. A hero's death or victory!"

So one day Garth found himself in a large room, all mirrors, gilding, and French furniture, waiting for some one to appear.

She entered at last, with that wide throwing open of the door that had always characterized her, and was somehow not incompatible with a nature in so many ways reserved and shy. They shook hands. Some commonplaces passed. Elinor's hand had felt cold when he touched it, and her face wore that distant and almost haughty expression which he knew so well, and loved because he knew it.

"Is Mrs. Tenterden well?"

"Yes; she'll be down in a minute."

She had taken her seat on one of those comfortable little gilded French chairs, and was pressing her slender hands one upon another on her lap. But a hero is not to be defeated by a French chair. Garth walked across the polished floor and stood in front of her. She glanced up in fear—in that sweetest of all fears that no pen can ever describe. He said:

"Then I have only a minute to tell you that I love you. I want to tell you so with my whole life."

It was as awkward as most impromptu love speeches. Elinor drooped and hung her head. Garth bent and kissed her cheek, which flamed pink as the kiss came. Then she put her hand in his, and rose and looked him in the eyes. What were French chairs or the world to them!

Mrs. Tenterden did not come down for at least a quarter of an hour. That must have been a long time, for it was enough to make Elinor and Garth all over new in; and yet a short time, for they had not seen to the bottom of one another's eyes. Elinor's first words were (just before Mrs. Tenterden entered),

"Dear Jack! I love him, Garth!"

Garth, strange to tell, kissed her for those words. But such is friendship, and such is love!

THE END.

Editor's Easy Chair.

ON a late beautiful spring afternoon the Easy Chair rolled itself into the suburbs for a stroll. There were every where the signs of the advance of a great city and the pathetic forlornness of the municipal frontier. Pleasant country-houses, spacious, rambling, with broad piazzas and gardens and lawns, had been apparently suddenly overtaken by streets and stone sidewalks and lamps. There were the rattle and shriek of the incessant railway trains near by. Tall factory chimneys smoked and machinery hummed and steam-whistles blew all around the quiet old houses. The contrast gave them a kind of conscious life. They seemed to be aware of the incongruity of their character with the new neighborhood. They had a helpless air, as if nothing remained but submission to division into regular building lots and the absolute extinction of rural seclusion and charm. There was the impression of a faint and futile struggle between city and country, in which, indeed, for a moment the excellence of each was lost, but the result of which was not doubtful. As the Easy Chair pushed on, it saw in fancy the old pastoral peace and retirement of the places when they were indeed in the country. It recalled the noted men of that older day who sought here relaxation and repose. There was the placid river, on which no restless steamer foamed, but only silent sloops drifted or careened. Yonder were the leafy coves under the wooded and rocky banks, from which the Indian had but recently paddled his canoe. No railroad harmed the virgin shyness of the shore. It was El Dorado, Arcadia, the land of Goshen. It was the home of peace, of plenty, of content.

Such a poet, such a painter, is idealizing memory on a spring afternoon in the suburbs. It seemed so gross a wrong that sidewalks and gas lamps and factory chimneys and steam-whistles should invade and devastate the tranquil fields that indignant imagination filled them as fact with all the fancies that tranquil fields suggest. Doubtless in the closets of those quiet houses there were the bones of plenty of old skeletons. Those spacious, sunny rooms were the scenes of the familiar domestic tragedies against which not the most romantic of country-houses can shut the door. Up those steps have swayed and hesitated the doubtful feet of the oldest son, heir of precious hopes and child of fervent prayers, hesitating and lingering at hours long past midnight, watched for and waited for by the mother's heart that breaks but does not falter. In that broad hall, on the brightest of May mornings, the daughter of the house has stood, radiant as the day, and crowned with orange blossoms. There have met the hopes and joys of youth, the tears and blessings and farewells of older years. The pretty pageant filled the house, and faded slowly and utterly away. The old house has known, too, the solemn shadow that falls on every house. It seems to regretful memory the abode of unchanging delight. But from that door the slow procession moved, and those whose hospitable smile and word had hallowed every room returned no more. They are gone, the bride, the parent, the friend; "they are all gone, the old familiar faces," the age, the society, the politics, the interests. They are all gone. Why should not the house go too?

It was early spring, and the Easy Chair, looking up, saw half a dozen kites flying in the air. A little further, and laughing girls were skipping rope. Boys were spinning peg-tops and playing marbles and driving hoops. The boys and girls who lived in the quiet old country-house did the same a hundred years ago. They flew kites and drove hoops, and that little bride skipped rope and carried dolls. The age, the society, the politics, the interests, were very different. They are, indeed, all changed. But tops are changeless, marbles are immortal, and so are boys and girls. They know nothing of the old house over which the Easy Chair becomes pensive. They belong to the new time, which demands its demolition.

It is some years since a noted man said to the Easy Chair, "Remember, the one thing that all people want to hear about is, other people." The constant stream of personal memoirs that pours from the press, and the singular interest which each excites, seem to justify the remark. The noted man himself believed what he said. He practiced what he preached, and wrote and printed all kinds of personal gossip, until it appeared that nothing else seemed to him very important. The exaggerated interest attached to the details of a disappearance like that of a late Mayor of New York illustrates the same taste. Of course if a conspicuous citizen mysteriously vanishes from among men, the press most properly raises the alarm. But when he is found, the press knows very well that the public would like to know all the reasons and the circumstances, and the probabilities of the future. Is the secret of this universal interest in personal memoirs and descriptions and details merely the sympathy of men with men? Is it that nothing human is foreign to us, or that history and biography are distrusted as flattered or incorrect portraits? Or is it that we like gossip "pure and simple," as children like candy and cookies?

It is certain that the conversation of morning calls and reading clubs and dinner and tea tables tends to personal criticism and narration; and no books are more entertaining and popular than diaries and autobiographies, provided they are not philosophical, but abound in descriptions of persons and personal relations. It would be unfair to condemn this as altogether trivial. The interest with which the mask of Shakespeare is regarded is the sign of the earnest desire to know the truth of Shakespeare's personal appearance. A photograph of Milton or Chaucer would be invaluable. For it is the prerogative of genius to hallow every thing which is personal to it with the subtlest charm. We can not have a mask of Chaucer nor a photograph of Spenser; but could they have had a Boswell, we should all be grateful. That delightful book is still as fresh and captivating as a novel. But it is the book of a gossip. It is the most charming of personal memoirs; and if it is beneath the dignity of history, so much the worse for history.

There is always a question, however, when an autobiography is published, whether the unreserved and possibly unjust personal criticisms of other people should be made public, or whether they should be restrained by a person who is still

responsible to other persons and to public opinion. This is a question of the judgment and good sense of living persons; for a man might write an autobiography so plainly unjust to himself, as well as to others, that even his express injunction for its publication after his death should be disregarded. The same discretion must determine the decision when the reasons are similar, if not precisely the same. When A and B are dead, but when their families survive, why should the private opinion of A, formed forty or fifty years previously, that B was a scoundrel, be published? What possible result can there be but pain to worthy people? The answer to this question must be the same that the Easy Chair gave in considering the hard words of contemporaries in the diary of John Quincy Adams. To omit invective and sarcasm and extravagance would be to omit Mr. Adams. The question in such a case is not of softening the words, but of printing them precisely as they were written. If nothing more than the gratification of a gossiping curiosity is to be gained by publishing, in his own words, John Quincy Adams's opinion of Daniel Webster, then it should not be published to the pain of his kindred and friends. But very much more is to be gained. We have the opinion of one illustrious contemporary of another whom he had the capacity and opportunity to study, and such opinions are indispensable to a correct judgment of men and the consequent conduct of life.

When a man's life becomes public, that is, when he becomes distinguished and conspicuous, there is a public interest in him which has its rights no less than private affection. Public morality then demands that the truth about him should be known. If, for instance, he has worn a mask, and a cold and selfish Catiline has assumed the patriotism of Arnold Von Winkelried, the witness who knows, or who thinks he knows, should be heard. For it is more important to the general welfare that the character of such a man should be disclosed than that the feelings of his descendants should be spared. Nor will this principle tend to the writing of autobiographies overflowing with vitriol upon fair and sweet fames. For every person whose opinion would have any influence upon reputation or renown knows that he is himself upon trial in his own diary. The one thing sure to be seen and known is the character of the author, and the instance would be very exceptional in which he would destroy his own name in order to stain that of another. The diary of John Quincy Adams, for instance, confirms the general impression of himself which his whole career and all testimony had established, and in nothing more than in the tone in which he describes other public men.

Here, then, is a key to the deep and universal interest in personal memoirs, letters, and diaries, that they are the sincere testimonies to the actual character and significance of famous people. Readers who wish to be deceived will avoid them. Those who prefer pleasing and traditional fancies to facts will dislike them. But if Washington had a hot temper, and swore at Monmouth, and was severely punctilious, and had not fully mastered the spelling-book, who would not know it, and who would reverence him less? If Franklin was canny beyond the Yankee, and conformed to the morals if not to the costume of the gay

French capital, who would not know it? Who would wish to respect Gambrinus as a saint or Pan as an ascetic? Who deliberately loves a lie? We certainly do not wish to have heroes and saints under false pretenses.

In reading the diaries and letters and memoirs, it is easy to see how indispensable their information is to an accurate and just estimate even of persons supposed to be known. If any man of recent times lived in the public eye, it was Macaulay. He wrote in the reviews; he was a member of Parliament; he was at all the breakfasts and dinners. If a lucky loiterer in London breakfasted with "old Rogers," he met Macaulay; if he dined at Holland House, he met Macaulay. People had "made up their minds" about him and his character. But the delightful memoir by his nephew, with the letters, has given us in some very important respects a new Macaulay. This omnivorous reader and brilliant historian never read Carlyle's *French Revolution*; and the heart of this supposed cold and worldly old bachelor was an exhaustless fountain of sweet domestic affection, of rollicking love of children, and of a simple and humane humor. The book, upon the most conclusive evidence, revises the general judgment. How invaluable, also, as side lights upon a necessarily conspicuous person, are the glimpses of King William the Fourth of England in the Greville *Memoirs*, or those of the household of Metternich in the Ticknor *Memoirs*. Bagehot says—and says, without doubt, truly—in his interesting book on the English Constitution, that there is really profound loyalty in England, and that there is a very general popular conviction that the Queen is the ruler of the realm. This feeling is the relic of the mystery that doth hedge a king. But it does hedge him. It is the sentiment by which royalty is strong. It is that feeling, and not a politico-philosophical dogma of a permanent executive, that keeps the king on his throne. But how the glamour of the mystery fades and dissolves before the photograph of Greville! His diary becomes an element of political history.

The fair question about a diary left by a noted person or by any person, with or without instructions, is simply whether it shall be published or suppressed; not whether its opinions and descriptions of others shall be touched and toned and modified and cut out to suit supposed sensibilities or to save the reputation of the author. It is a wholesome moral police that people should be taught the responsibility of distinction. They should know that when they become objects of attention and interest and description they are to be peculiarly circumspect in manner and conduct, and as their portraits will constantly be drawn unconsciously to themselves, their position and action must be those of which they will not be ashamed. This will cultivate personal consciousness in no other way than it is fostered by all self-discipline, and it will restrain the vanity and self-indulgence which distinction sometimes produces. The "chiel amang ye takin' notes" is a very useful personage, if we only have faith that he will "prent" them.

A WORTHY gentleman, who lives out of town, was amazed the other day by being suddenly asked, "Who runs your village?"

All the pride of a suburban citizen, who hears

birds in the morning instead of milk-men, flashed in his eye as he replied, "Nobody."

"Ah! then you don't have Philharmonic concerts."

"No, Sir," was the lofty reply; "and no other rural community has Philharmonic concerts."

"There's where you're mistaken," was the lively answer; "and it comes of living in a village that is not properly 'run.'"

When the other gentleman asked if "running" was indispensable to Philharmonic concerts, he was answered that in every little community there must be some leader in every direction of activity or interest, or nothing would be done. There is a certain amount of "running" power latent in every rural neighborhood. This may "run" away with the neighborhood into all kinds of follies and abuses, or it may stimulate and lead it to the most desirable and delightful results. But the "running" power must be more or less highly developed in some few persons, or, good lack! quoth the earnest gentleman, you'll not only not run, but you'll stagnate.

The earnest gentleman, whose name was Rusticus, proceeded to say that his neighborhood had suffered a good deal from some of the more familiar and unpleasant results of this spirit of "enterprise," as it is called. It was perpetually designing boulevards and spacious avenues, and bent upon enhancing the value of every body's property by making it a corner lot by an infinite multiplication of streets. It was always striving to "attract capital" to the neighborhood, to "stimulate activity," and to draw population. It planned to dispose of quagmires and bleak hill-tops under salvos of Champagne corks and the hospitality of free lunches and bands of music. Mysterious allusions to the charms of that vicinity, to its ease of access, and to its freedom from all the heats, mosquitoes, and chills and fevers that usually infest suburban communities, appeared from time to time in the columns of city newspapers. Meanwhile this form of the "running" power ran the neighborhood into debt, and left it toiling through deep and direful mud in the spring, and was responsible for such swearing as has not been heard since the army was in Flanders. There were jobs of every kind on all sides, and the public welfare was maintained only by a constant fight with the spirit that was trying to "run" the village.

Now, said Rusticus, behold the obverse of the medal. Behold the advantage of the same spirit directed to the most delightful results. It is true that in all communities and enterprises some one must lead the way. Sam Adams directs the Boston Mohawks to the tea ships. John Adams is the Colossus of Independence. Columbus sticks fast to his new route to India, and reveals a continent. If, now, in your village, continued Rusticus, addressing his friend, there were some generous and intelligent musical enthusiast, for instance, who had such faith in his own faculty that he scorned enterprises that "do not pay," who saw around him plenty of people willing to enjoy if the way could but be opened, but no one of whom would open it; some one who had energy, resolution, and organizing power—why, you would have Philharmonic concerts in your sleepy old village, and you and your friends would all be on the committee, and you yourself would be selling tickets, and turning out in the evening in a white cravat, and putting on white gloves, and

handing beautiful *prime donne* up to the platform, and clapping and encoring vociferously, and pitying the unenterprising villages that have no Philharmonic concerts.

The listener beamed approvingly, as if the picture pleased his mental eye.

Then, Sir, you would have the most exquisite chamber music, duets, quartets, quintets, sextets, septets, octets; you would have the music of Beethoven, Handel, Haydn, Bach, Mozart, Weber, Mendelssohn, Wagner, Schubert, Chopin, Meyerbeer—the old masters of the orchestra and the new virtuosi upon the piano, the violin, and the violoncello. Instead of making a journey to the city and passing the night, and putting yourself to such trouble and expense that the prospect would dismay and deter you, you would merely take a pleasant walk after your domestic dinner, and with your neighbors and friends hear the most delightful music, and return quietly to your own fireside.

A man who "runs a village" in this way is a public benefactor. He is an invaluable citizen in his community. For he sees that all the conditions of success in enjoyment are present in it except the cardinal one of impulse, and he supplies the impulse. The particles are all ready to crystallize if there were only the necessary motion, and he gives it. And it is by no means a mere sentimental service that he renders, if by that word be meant something unreal and incalculable. The other type of the man who "runs" a village supposes himself to be especially "practical" because he opens new roads where the old are impassable from neglect. When the village has not money enough to keep itself in order, he increases the area to be kept in order, without supplying the money to pay the expense. His excuse is that "improvements" enhance the value of real estate, and that a man who does not wish to multiply corner lots and increase the value of real estate is an aristocratic nuisance. But measured by this real-estate standard, the promoter of good music and of pleasant public assemblies in a neighborhood is one of the most practical of men. The value of suburban property depends in a degree upon the character of the neighborhood, its advantages and conveniences. Surely, then, the citizen of a village who furnishes occasions of delightful neighborly meetings, who supplies to the villagers those pleasures the want of which prevents a great many people from becoming villagers, attracts them into the country. He is a magician, a Pied Piper of Hamelin who plays his wondrous pipe, and willing converts dance enchanted after him. A man who provides Philharmonic concerts for a suburban village no less improves the value of its property than he who at the public cost devastates secluded pastures with boulevards and makes roads where nobody wishes to travel.

Rusticus avers that he knows a village not a thousand miles from New York which is properly "run," because it has the enthusiasm, the energy, and the taste to procure and enjoy such music. He declares that he has heard as charming chamber music as any citizen could have heard in the city during the last winter. He does not deny that he and his friends should not have had the rare enjoyment except for the devotion of one man. "But you see," he says, with great complacency, "that is the very superiority of our vil-

lage. We have the man who knows how to run it. And luckily for you, my friend, there are two or three houses in the village still to let."

THE great disaster at St. Louis, the burning of the Southern Hotel, with the frightful loss of life, undoubtedly confirms a very general conviction that our hotels are very insecure. No one but the most hardened guest can ascend flight after flight of stairs in a hotel, or mount by the elevator to the upper stories, without a sinking of the heart and a vague terror. As he surveys the long and blind passages, and the narrow staircases, and thinks of them filled with suffocating smoke, the gropings in darkness and confusion—all the circumstances, indeed, which the St. Louis fire presented—his first impulse upon reaching his room is to see how he can escape. Every thing is inflammable. There is nothing really fire-proof in the building. It is peculiarly exposed to fire, and there is no provision of adequate means of escape. This is probably true of most of the great hotels in the country. They are considered dangerous risks by the insurance companies, and the catastrophe at St. Louis will probably direct attention to them, as the awful burning of the Brooklyn Theatre aroused general anxiety in regard to halls and play-houses.

It must not be forgotten that while these great hotels are, in regard to their structure, very much what they used to be, all the modern improvements and inventions which make them much more "magnificent" make them also very much more insecure. The largest group of hotels in the country—those at Saratoga—are less dangerous only because they are occupied in the summer, when there are no fires but in the kitchens, because the nights are very short, and because, from the nature of life at a watering-place, there are constant wakefulness and observation. But if those huge caravansaries were winter houses, and in the long winter night, when every room was crowded, a fire should break out, the consequences would be appalling. The general structure of the houses, as of all other houses, is very much what it was fifty years ago. But as they have increased in extent and height, the modern inventions of matches, furnaces, gas, elevators, have been developing, and each one of them is a fresh exposure. The matches are strewn every where through the rooms, and a careless step, a thoughtless dropping, may fire the train. The furnace flues pervade the house, and are necessarily beyond observation, although the proved sources of danger. The gas is every where close to the match, and often near to the window drapery. And, more recently, the shaft of the elevator is found to be a flue through which fire and smoke can fill every floor.

But while the risks of hotels have been thus constantly multiplying, the defenses have not increased accordingly. The Southern Hotel at St. Louis was one of the large and finely appointed houses of the country. Doubtless it was "magnificent," and amply furnished with all "improvements"—except that of means of escape and safety in the event of a peril that is always menacing. But if a small part of the money that had been spent in magnificence had been devoted to security, the catastrophe would have been averted. There is no especial blame to be urged in this instance. There are hundreds of hotels in the country at this moment exposed to the same dan-

ger, and they all, doubtless, have the same general provisions for safety—provisions which have been shown to be absolutely insufficient. There is always risk, indeed, in every ordinary dwelling-house. But the general conditions make the difference between the hotel and the ordinary house. Now fire was very probable in the Southern Hotel, as it is in every other hotel. If fire broke out in the middle of the night, at the very hour when this fire occurred, what means of escape were provided for those who slept under the roof or on the higher floors? The same general means, unquestionably, that are provided in all great hotels. But are they adequate? The terrible result at St. Louis is the answer.

The remedy is obvious. Whether public opinion will require it to be applied is not so clear. Yet the law requires sufficient fire-escapes on every tenement-house in the city. Is human life less precious in a hotel? Why should not the law require of every hotel means of escape from every floor so ample and simple as virtually to render such disasters impossible? The public right of self-protection, which justifies the laws in regard to safety in erecting buildings, and those that affect theatres and steamboats and railroads, would authorize the most stringent measures in regard to hotels and the methods of building. The height of such structures, the materials for stairways and walls, the details of escapes, are as properly subjects of legal direction as the inspection of steamboat boilers or the strength of the walls of houses. The law properly supervises the safety of public conveyances. It should, with the same reason, take charge of the safety of public houses.

This would require a public determination upon which no man can surely count. Undoubtedly the same money that now erects splendid hotels could build safe hotels. But the splendor would be sacrificed. If any community, however, should be willing to do this, it is ours, which is, in truth, a travelling public. The traveller seeks rest and comfort at his inn. But the vital element of comfort is security; for if there be a lurking sense of danger, the utmost ease is but an appearance, not a fact. Damask sofas and Turkey carpets and Champagne and salmon and spring beds do not produce comfort if there be peril in the air. If the American traveller prefers to take the risk as inevitable, the St. Louis catastrophe will be occasionally repeated. If, on the other hand, he chooses to be secure, he can make himself so.

WHEN Oliver Goldsmith died, the poor old women whom he had befriended sat upon the staircase outside of the little room in the Temple in which he lay, lamenting a friend whom they should see no more. He had always little money to give. His alms were kind words and sympathy and encouragement, and now and then doubtless a "cheering glass." He died destitute and miserable. "Your pulse," said his doctor, "is in greater disorder than it should be from the degree of fever which you have. Is your mind at ease?" "No, it is not," replied Goldsmith. He owed money. "Sir Joshua is of opinion that he owed not less than two thousand pounds," said Dr. Johnson. Johnson loved him, and spoke of him for years with tender sadness. Burke loved him, and burst into tears when he heard of his death. Reynolds loved him, and when the news was

brought to him, he laid his palette aside. "The Club," of the most famous men in England, lamented him. But there, on the staircase of Brick Court, sat "women without a home, without domesticity of any kind, with no friend but him whom they had come to weep for—outcasts of that great, solitary, wicked city, to whom he had never forgotten to be kind and charitable."

There is no incident in his pathetic and, as seen in the light of his "Traveller," his picturesque life which is more touching than this. The great men knew his genius and his wit and his heart, but these poor women knew his heart alone. Can there be any truer test of character than that which the little story conveys? The man who loves children and whom children love is sure to be a man of sweet and lovely nature. We should really know more of men if we were able to try them by such tests. Nothing more truly revealed the essential quality of the character of the late Joseph Wesley Harper than the incident mentioned when he died, that at a time of great apparent misfortune the domestics in his household came weeping lest they must go, and asking to remain at whatever wages. A man might face heavy blows of disaster or vast good fortune with unblenching eyes, but he might well be unmanned by such a tribute. It is his home and his neighborhood that measure the man. He can not play a part to them. In public, before the world, he is on parade. Two make conversation possible, but three are an audience. What every man would like to know of his hero is his impression upon those who intimately know him, and those from whom he can receive no favors. Do his children love him? Do those whom he employs trust him? When he dies, will his poor neighbors grieve, and his neighborhood feel that it has lost, not a large tax-payer, but a friend?

The influence of men who are so lamented is most subtle and pervasive. There are men whose commanding and brilliant powers arrest the attention of mankind. They blaze and glitter before the astonished world like the girandola at St. Peter's, or the cold and remote splendor of the northern lights. There are men who entertain and amuse, whose death eclipses the gayety of nations. There are others who pierce and disclose the secrets of nature most jealously guarded, who change the current of human thought and reverse old creeds and standards. These men amaze and delight. They are renowned and hon-

ored. They remain in histories and in their own writings, and are a permanent possession of the race. But the men of whom we speak, and whose influence is so fine and wide, affect human character and elevate human life by revealing the sweetness and the worth of human nature. They make us all more charitable, more patient, more trusting. They are often the most retiring of men, and known only to a very small circle; but they are not less benefactors than the most renowned.

Such a man was the late George W. Jewett, who was killed by the terrible explosion in Burling Slip in New York. His occupation was that of a manufacturer and merchant, and he was very successful in his business. He lived quietly upon Staten Island, and took no part in public affairs except those of his village. To his neighbors he was simply a modest, unobtrusive, kindly citizen. But their feeling when he died was the test of the man in his general neighborly relations. Those who knew him somewhat more closely felt the charm of that essential kindness which brought the homeless women weeping to the chamber of Goldsmith when he was dead. Unconsciously, contact with a gentle and generous nature deepens and confirms confidence in all men, and corrects that cynical distrust which constantly produces the evil that it suspects. No man knows or measures his real influence. And the wise old saying that no man must be called happy until his death has a richer meaning than that he can not tell until then all that may befall him. Death openeth the gate to good fame, says Bacon; and to such men as we are considering, no happiness could be greater or purer than the general affection for them which death discloses, and which is the measure of the quality of their influence.

On the bright, gusty day in early spring that Mr. Jewett was buried, the rich and the poor stood together in and around his house, and their mingled and sincere regard and sorrow were the earnest in him of that quality of manhood which is more than genius and fame and learning and riches and authority. There was no sermon, as there were no flowers. Any kind of ostentation, any word of the affectionate and natural praise of such a moment, would have seemed an invasion of the manly modesty in which his life had been wrapped. But if a sermon had been seemly, its text should have been, "Out of the heart are the issues of life."

Editor's Literary Record.

Russia (Henry Holt and Co.), by D. MACKENZIE WALLACE, is not a book of travels. Mr. Wallace went to Russia in March, 1870; he remained there until December, 1875, nearly six years. He spent the winter months in St. Petersburg, Moscow, and Yaroslavl, the summer months in journeying. This period of residence was followed by a still further accumulation of materials by correspondence after his return to England. Thus his work affords not the impressions of a traveller, who gets glimpses, and gives external pictures; it embodies the conclusions of a student who has taken the time to give the labor to a real and genuine study of the life which the tourist merely sees, but does

not and can not thoroughly comprehend. A single illustration may suffice, by giving the reader a notion of his method, to give also a notion of the thoroughness of his work. Mr. Wallace desired to acquire the Russian language, and for this purpose to put himself beyond the reach of French and German; he therefore exiled himself from St. Petersburg, took up his abode in one of the provinces, made the acquaintance and friendship of a priest, was taken ill, sent for a Russian "feldsher," and thus made a threefold study of Russian language, Russian religion, and Russian science. His studies in this province of Novgorod alone occupied several months. We know of no

author, not excepting Hepworth Dixon, who has made so thorough a study of Russian life and character as Mr. Wallace, or whose work is so well worthy the careful study of any one who desires to know the character of this curious people, who are apparently about to exercise so important an influence on the destiny certainly of Europe, and perhaps of Asia, and who in the impending conflict between Christianity and Mohammedanism are put forward by the course of events in the forefront of the battle. Mr. Wallace does not follow a chronological order, but he uses his own experiences to illustrate the various phases of Russian life, and while his book is not in form a diary, it possesses the personal interest of personal experience.

We have heretofore, in the body of the Magazine, given our readers some idea of Lieutenant CAMERON'S *Across Africa* (Harper and Brothers). He started from the eastern coast, traversed the continent from east to west, meeting the body of Livingstone while on his journey. An excellent map accompanies the volume, which is also fully illustrated from sketches taken *en route*. The author's style is severely simple. His book is chronological in order, and is little more than a report of what he saw and experienced. He attempts no fine descriptions, and stops for no philosophizing. In truth, his work appears to be in large measure a transcript of his notes made while travelling. It is a valuable addition to the library of African travel, which has already grown into such considerable proportions.—There is nothing to indicate the date of the present American edition of Lord DUFFERIN'S *Letters from High Latitudes* (Lovell, Adam, Wesson, and Co.). The trip which he describes was taken in 1856. Lord Dufferin is unmistakably a sailor by nature. Yachting is to him a very different recreation from that of the pleasure sailors in Long Island Sound. He left the coast of Great Britain the 1st of June; he returned the middle of September. In the mean time he had visited Iceland, Jan-Mayen, Northern Norway, and Spitzbergen. He had worked his way in and out among floating floes of ice, which, with an adverse wind, might at any moment have crushed his little boat. He had sailed through storm and fog, and made his way without a pilot into the uninhabited harbor at Jan-Mayen, and the almost equally dangerous harbor at Hammerfest. He had danced with the Icelandic ladies, camped among the Geysers, and called on the Lapps. The hazard of his adventures apparently added as much to his enjoyment of them as it has added zest to his book. His descriptions are particularly good, especially his coloring, which is brilliant. The volume is a capital one for summer reading.—There is no danger of too many books on Palestine, for each new tourist gives us, if not new information, at least a new aspect of a land which is as many-sided as the sacred life that makes the most bare and barren of countries the most beautiful and interesting to Christian hearts. Rev. ALBERT ZABRISKIE GRAY'S *Land and the Life* (A. D. F. Randolph and Co.) consists of nine chapters, not so much descriptive of the land and its sites, as meditations upon them and suggested by them. The author's purpose is neither historical, geographical, nor theological; it is rather meditative. But the meditations are those of a modern American preacher, not of an ancient recluse—genu-

ine, not imitative. It is valuable rather as a book of Sunday reading for the home circle than as an addition to our positive stock of knowledge concerning a land which has been explored and studied by others much more thoroughly than Mr. Gray had the opportunity, or perhaps even the desire, to explore.—Mr. J. D. B. STILLMAN'S *Seeking the Golden Fleece* (A. Roman and Co.) carries the reader back twenty-five years ago; and that is a long way back. The voyage to California was made round Cape Horn. California itself was a wild country, whither the gold magnet was just beginning to draw the population that have since made it what it is. Among the early Argonauts was Mr. Stillman. His book is the record of his voyages thither and back, and of his pioneer life while there. One is impressed with the fact that it is a collection of valuable material, but that the author has either been careless or unskillful in the use of it. The book is in the form of a diary, and apparently is little more than a transcript of the notes of travel made at the time from day to day. Only about seventy pages are devoted to California life; the rest are occupied with the journeys. The incidents of pioneer life are suggested rather than described. To the Argonauts of California, to whom it is dedicated, the book will be a pleasurable reminiscence. To other readers it will be somewhat tantalizing from its fragmentary character.

The second volume of VAN LAUN'S *History of French Literature* (G. P. Putnam's Sons) carries on the history from the classical Renaissance, in the beginning of the sixteenth century, to the end of the reign of Louis XIV., in the beginning of the eighteenth. Among the prominent authors treated are Ronsard, Malherbe, Corneille, Pascal, Richelieu, Descartes, Molière, La Fontaine, Boileau, Racine, Bossuet, Fénelon, Massillon, and Bayle. Some idea of the author's range may be gathered from this simple list of names. It includes the stage at the one extreme, the pulpit at the other, and all ranks and classes of literature between the two. The author's work is remarkably colorless—perhaps too much so. His apparent intensity of purpose to present an impartial history prevents him from giving vividness to his character portraits. He tells us something of the lives of the great writers, something of their work, and quotes a few illustrative passages from their writings. But we miss that brilliant drawing by which M. Taine, in his *History of English Literature*, makes of every author a grand portrait, possibly not always true, but certainly always striking. Nevertheless, Van Laun's work is probably to be the history of French literature for the English student of the future.

He Will Come, by STEPHEN H. TYNG, Jun., D.D. (Mucklow and Simon), is correctly described on the title-page as "meditations upon the return of the Lord Jesus Christ to reign over the earth." The author holds the same views respecting the second coming of Christ as are entertained by the evangelist Mr. Moody; his book is largely composed of a skillful marshaling of Scriptural testimony; he enters into no critical discussion, but assumes the literal and natural meaning of the words; his pages are infused with that peculiar charm which belongs to genuine spiritual experience; and while his treatise will not be at all conclusive to those who are accustomed to interpret the prophecies of a future coming spiritually, it will give even to them a respect for a doctrine

which possesses apparently so much power to inspire Christian life and Christian hope.

Princeton has been so long a synonym for every thing that is conservative in theology, that novelty coming from that town is novel indeed. No man will deny the merit of novelty to the curious speculations in the treatise of Rev. JOHN MILLER, entitled *Questions Awakened by the Bible* (J. B. Lippincott and Co.). These questions are the following: Are souls immortal? Was Christ in Adam? Is God a Trinity? Mr. Miller's answer to each of these questions is not that of the orthodox churches generally. He believes that the soul is not immortal, that it dies with the body, but that after a period of sleep both body and soul will rise again to live forever. He believes that Christ was in Adam, in the same sense in which the whole human race was in Adam; that accordingly He was under "original sin," whatever that may be; that accordingly He needed a ransom, and was ransomed through His own sufferings. He disbelieves in the church doctrine of the Trinity, holds to the perfect divinity of Christ as God manifest in the flesh, but repudiates the doctrine of three persons in one God as unscriptural and unphilosophical. He writes with great frankness, and while his theology will not in this age make any great excitement outside of his own denomination, it can hardly fail to provoke a keen discussion among his own co-presbyters. Apart from the ecclesiastical aspects of the treatise, it is curious and interesting as an indication of the general break-up of the old-time forms of thought, and the increasing independence of mental action in the church on all questions, even the most fundamental. It is only right to add that Mr. Miller writes in a thoroughly Christian spirit, without bitterness, sarcasm, or dogmatism.

The Apologies of Justin Martyr, with an Introduction and Notes, by Professor B. L. GILDERSLEEVE, of the Johns Hopkins University (Harper and Brothers), is a piece of thorough work that deserves cordial recognition not only from professed theologians, but from all students of classical philology. To the theologian, who seeks to trace at first-hand the historic development of the Christian church, Justin is indispensable, for it was given to him to grapple with the subtlest heresiarchs of the early days—with Marcion and Valentinus—while about him revolve some of the most momentous problems of Christian tradition. Chief among these may be mentioned the doctrine of the Trinity, the nature of the sacraments, the order of the Christian church, and the "burning question" as to the establishment of the canonical Gospels; for on Justin's acquaintance with the fourth Gospel hinges the fierce controversy which has brought into being a great historical school. So nice is his testimony on all these points that he is confidently quoted by partisans the most irreconcilable, each disputant allowing the genuineness of the Apologies, and all according due meed of reverence to the utterances of an honest and courageous spirit that quailed not in the presence of imperial dignities, but spake the truth with noble frankness, and finally sealed his devotion to his Master with his blood. Thus it is that Irenæus and Tertullian did not hesitate to borrow largely from his writings, that the more polished fathers of the fourth century did not disdain to imitate passage after passage from the rugged

apologist of the second, while to-day he is triumphantly brought forward as a conclusive witness by Keim on the one hand, by the author of *Supernatural Religion* on the other.

All this and much more to the purpose has been brought out with rare literary skill and tact by Professor Gildersleeve in his "Introduction," which is well worth the perusal of the general reader, who may have neither time nor inclination to go seriously into Justin's tenets or stylistic peculiarities.

It is to these last that Dr. Gildersleeve mainly addresses himself, adopting Thirlby's motto, *Nobis semel constitutum est controversias theologicas non attingere*, and thus, very properly in a text-book, subordinates questions theological to questions historical and grammatical.

Few critics, save Winer and Bunsen, have had aught but unmeasured censure for the style of the Apologies. They have sneered at its negligences of syntax, its bewildering parentheses, and sighed with erudite sorrow over the decadence of the Greek language of the time. In the present volume the peculiarities of Justin's language have been brought to the test of classic usage, and Dr. Gildersleeve, with a wealth of parallel which evidences clearly enough his thorough German training, shows conclusively that much of this criticism is traditional, false, and superficial.

Time and again, strong in his scholarship, he delivers ugly blows at English and Continental scholars, who have sought to "emend a corrupt text by impossible forms and unheard-of syntax," and in so doing has found opportunity to expound with great force and clearness the leading principles of model Greek syntax. Especially noteworthy is his masterly discussion of negative and hypothetical sentences, wherein he lays down more than one compact canon not to be found in the grammars; while every student of Greek, who knows somewhat of the difficulty of the subject, will thank him for the nice discrimination displayed in the matter of synonyms. To the Apologies Dr. Gildersleeve has added the famous "Epistle to Diognetus," which can not be Justin's, yet is commonly included in his works, and which Bunsen declared to be "indisputably, after Scripture, the finest monument we know of sound Christian feeling, noble courage, and manly eloquence."

The book is marked by notable typographical accuracy, and American teachers may be congratulated on possessing a patristic text-book which, so far from working injury to the classical training of their pupils, is eminently fitted, by placing in juxtaposition the divergences of later Greek from the Attic model, to give additional delicacy and grasp to their scholarship.

Dr. M. L. HOLBROOK's little treatise on *Liver Complaint, Dyspepsia, Headache*, is decidedly useful for its purpose. He who attempts to doctor himself, it is true, is likely to have a fool for a patient, but it is also true that in instructing the laity how diseases may be avoided, the physician is performing a duty equal if not paramount to the exercise of his healing art in curing existing maladies. The object of Dr. Holbrook is rather prevention than cure. His declaration that for sick headaches all pills and powders are useless is too sweeping, and some of his statements concerning the liver and its derangements, as being the fountain-head of ills, require qualification, but,

barring these blemishes, the book is a very useful one, and affords many hints as to the conduct of the body, which, if obeyed, would certainly reduce the particular ills which, in the interest of humanity, he seeks to abate.—“Harper's Half-hour Series” is a novelty in book-making. It is a series of small books in paper binding, printed in a clear, readable type, easily carried in the pocket, and in a form convenient for reading in the cars, the station, or the hotel. The themes are both grave and gay. Among the volumes already published are *Tales from Shakspeare*, by CHARLES and MARY LAMB, a well-known classic, and a capital introduction to the study of Shakspeare; ANTHONY TROLLOPE'S *Christmas at Thompson Hall*, a very amusing brochure, a light comedietta, quite unlike Trollope in conception, but very like him in execution; *When the Ship comes Home*, by the authors of *The Golden Butterfly*, a story of the sensational, or rather of the intensely dramatic, school, but so short that the sensationalism has no tendency to pall upon the taste in reading; and *The Turks in Europe*, by E. A. FREEMAN, quite the best and clearest presentation of the Turkish question that we have seen, answering with a cogent simplicity the three questions, who and what are the Turks? what have the Turks done? and what is to be done with the Turks?—We hope that the “Art at Home Series” (Porter and Coates) is an indication not only of an awakened interest in home decoration, but of the beginning of a general taste and culture. The books are small, inexpensive, simple in style, and easily mastered. They will not make the reader an artist, but they may at least be expected to give him the conception of the truth that there is such a thing as art. They will not endow with good taste a native barbarian, but they may at least afford to him a hint that there is possible unity in a room, or even in a house, and prevent him from leaving his wall-paper to one man, his frescoing to a second, his mantel to a third, and his furniture to as many minds as there are articles. The first volume, *A Plea for Art in the House*, by W. J. LOFTY, is chiefly devoted to furniture and furnishing. The second volume, *Suggestions for House Decoration*, by RHODA and AGNES GARRETT, is chiefly occupied with hints respecting decoration proper, that is, papering, painting, and draperies. It is a book only of suggestions, and its discussion of the all-important question, “What will it cost?” is not sufficiently specific to be altogether satisfactory.

We are heartily glad to see another of Mr. ROLFE'S plays of Shakspeare—*Macbeth* (Harper and Brothers). We hope that its appearance indicates that he intends to complete this edition of Shakspeare, or at least publish in succession all the most important plays. Having had some experience of the value of this edition for parlor readings, this Literary Recorder feels an unusual degree of confidence in recommending it as by far the best edition for use in the school-room or the social circle.—*The Cooking Manual* (Dodd, Mead, and Co.), by JULIET CORSON, is a book of small pretensions and considerable value. It is a little volume of 150 pages, intended to give certain very simple directions for furnishing healthful and palatable meals within the reach of all housekeepers. It is designed rather for the cook in the kitchen than for the mistress in the parlor. Some excellent general directions on different table subjects are

given, such as soup, fish, *entrées*, etc., accompanied with special and generally simple and inexpensive receipts. The motto on the title-page gives an idea of the spirit and purpose of the book: “How well can we live if we are moderately poor!” Miss Corson is the head of the New York Cooking School, and is fitted both by study and practice to answer this important question.—Porter and Coates re-issue an edition of HARRIET MARTINEAU'S *History of England from the Beginning of the Nineteenth Century to the Crimean War*. We see no indications of any revisions or alterations since the edition of 1863. It is comprised in four volumes, and it covers a period of English history not covered, we believe, by any other analogous work.

The Sun-Maid (Harper and Brothers), by the author of *Artiste*, is a pleasant story, and is properly characterized by the author as a “romance.” The course of the story carries us into three countries—England, Spain, Russia. The differences of character and temperament are, however, more strongly marked than the differences of race. Though the course of true love does not run smooth, it comes to a placid and happy conclusion; and though the chance that brings Sir Gilbert to the death-bed of Zophée's husband is one of a kind that rarely or never occurs outside of romances, its improbability is not intruded upon the attention of the reader. The author displays very marked power in description, as, for example, in his picture of the coming storm of snow on a Russian steppe.—*Lorley and Reinhard* (Henry Holt and Co.) is one of AUERBACH'S novels, and, like all Auerbach's, the vehicle for the expression of some philosophy in very suggestive poetic forms. These little gems that glitter in every chapter, and that might almost be taken from their connection and brought together in a column of wise sayings without losing their significance or their beauty, form a chief charm of the book. The story is throughout sorrowful: a tragedy almost unrelieved by healthful, happy love or hope; a story of love, of estrangement, of death. The curtain falls on the sentence: “Carnation and rosemary bloom on the grave of Lorley and Reinhard.”—*Pine Needles* (Robert Carter and Brothers), by the author of the *Wide, Wide World*, is a benevolent false pretense. You take it up expecting to get a story. You find what amounts to a translation of Pastor Harm's stories of mission work, with interpolations, questionings, and explanations in the circle in which it is read. Its object is to afford a little historical and a considerable religious instruction in an attractive form, and in so far as this endeavor ever is or can be successful, it succeeds. To those readers who relish instruction in guise of a story we heartily recommend *Pine Needles*.

MARK TWAIN'S *Scrap-Book* (Slote, Woodman, and Co.) is what Burnand would call a “happy thought.” It saves sticky fingers and ruffled pictures or scraps. It is simply the application to a scrap-book of the principle long in vogue in the self-sealing envelopes. The pages are prepared with gum, and are prevented from adhering by tissue-paper between the sheets. As the scrap-book is used, the tissue-paper is taken out, the page has simply to be moistened, and the scrap or picture pressed on. Neither paste nor gum-arabic is required by the user. It is a capital invention, especially for children, to whom the ordinary scrap-book is a never-ending source of delight.

Editor's Scientific Record.

SUMMARY OF SCIENTIFIC PROGRESS.

Astronomy.—On March 2, Palisa, of Pola, discovered an asteroid, which may be *Camilla*, or it may be 173. In the English journals 172 is credited to Borelly, of Marseilles, on February 5. If this is correct, 171, by Perrotin, January 10, was neither *Frigga* nor *Medusa*.

The directorship of the *Sonnenwarte*, at Berlin, has been offered to Kirchhoff. He has declined it, and it will for the present be under the charge of a committee of direction, whose members are Kirchhoff, Förster, and Auwers.

Professor Young has accepted the chair of astronomy at Princeton. He will have a large telescope at his disposal.

Dr. Konkoly, of the O'Gyalla Observatory, in Hungary, has recently communicated the result of his observations on the spectra of 160 fixed stars to the Hungarian Academy of Sciences. The bright bands in the spectrum of *Beta Lyrae*, found by Vogel in 1871, and previously by Secchi, are now wanting.

Hind publishes in the *Monthly Notices, R. A. S.*, a corrected orbit of *Alpha Centauri*, including Lord Lindsay's recent measures among the data; and Marth gives, in the same journal, means of computing an ephemeris of the satellites of Uranus.

The same number contains further speculations by Brett on the "specular reflection" of Venus, the main idea of which is that Venus reflects the sunlight from a vitreous envelope, much as a thermometer bulb would do. Mr. Brett suggests to observers of the next transit of Venus the propriety of looking in the globe of Venus for a reflected image of the earth, which will appear as a "minute nebulous speck of light." Mr. Brett has probably not considered that this "nebulous speck" would be less than one-fiftieth of a second of arc in diameter. Considering the difficulty of seeing Venus herself when very close to the sun, the hope of carrying out the provisions of this plan is rather a forlorn one, particularly as the light of this "speck" is diminished by reflection, and is to be seen close to a bright background.

Lassell also contributes a note on the relative space-penetrating powers of his telescopes and the Pulkova refractor.

The Strasburg meridian circle (by Repsold) is completely finished, and will be used for at least a portion of the coming opposition of Mars.

The Durchmusterung of the stars in the path of Mars, undertaken by Schönfeld, is not yet completed, on account of the extremely bad weather which has prevailed. Winnecke will publish a list of stars for observation, however, similar to that just given by the Astronomer Royal.

The eighteen-inch refractor for Strasburg has had several objectives made for it by Merz, among which a choice must yet be made, and until then work on the mounting is stopped.

A new observatory has been founded at Lyons, France, of which André has been named director.

The observatory at Kiel is now in its new building, and has lately received a new refractor, by Steinheil, of eight inches aperture. Its meridian circle is engaged in a Durchmusterung of stars less than 10° N. P. D.

The reductions of the transit of Venus observations are going on vigorously at Greenwich. All

the local time observations are completed, and the altitude and azimuths of the moon for longitude also—an immense task.

Lord Lindsay has printed Vol. I. of the publications of the Dun Echt Observatory. It is *A Summary or Index of Struve's Double-Stars*.

No. 3 of the publications of the Cincinnati Observatory has just been published by Professor Stone, the director. It contains the measures of 166 double-stars.

In the *Popular Science Review* for January, 1877, Mr. Proctor has an article on the condition of the larger planets, in which he maintains the great heat of these bodies, in opposition to the views expressed by Vogel in his memoir on the spectra of the planets, which obtained the prize of the Copenhagen Academy.

Peters, of Clinton, notes a striking similarity between the orbits of *Gerda* (122) and *Urda* (167), their elements being alike except in one point. They move in one orbit about the sun, in the same periodic time, but are about 180° apart.

Secchi publishes a list of 444 colored stars from Schjellerup's list and his own observations, with notes on their spectra, etc. It is noteworthy (and little known) that Sir William Herschel recognized the essential differences of the first three types of Secchi so early as 1798. (See *Phil. Trans.*, 1814.)

Nyrén, of Pulkova, has published an important paper on the position of the equinox for 1865.0, derived from observations of the sun made with the Pulkova transit instrument (Wagner) and vertical circle (Döllen and Gylden). The deduced position of the equinox differs by $+0.064''$ from that assigned by Greenwich observations, by $+0.055''$ from Pulkova (1845), by $+0.011''$ from Paris, and $-0.002''$ from Washington.

Houzeau, of Brussels, has presented to the Belgian Academy a Uranometry of nearly 6000 naked-eye stars, which was constructed by him during a residence of thirteen months in the West Indies. It is presumed that this work will shortly be published, when a more detailed notice of it will be given.

Barraud, of London, has contrived a new control for clocks, to be used with the Greenwich hourly signals, by means of which a clock having any *hourly* rate less than ± 2 m. can be kept right.

Mr. S. C. Chandler, of New York, gives in the *Astronomische Nachrichten*, No. 2119, the results of his observations in 1875 on twenty-five variable stars. Anomalies have been detected in the light curve of *R. Sagittae* which point out the necessity of further examination. This series is noteworthy as being the only one made in the United States (we believe) since Masterman's, published in Gould's *Astronomical Journal*.

From the Cordoba Observatory we learn that the reductions of the zones are in a forward state. All observations are reduced to the middle of the field in both co-ordinates in duplicate. The reduction to 1875.0 is completed for 700 zones out of the 754; Δt , c , and n are computed for all the zones, and two-thirds of the refractions are completed. In February the work of printing the first meteorological volume commenced. The plates for the Uranometry are two-thirds done, and in

general the depression of business in the Argentine Republic has not affected the work of the observatory so seriously as was feared by its friends.

Lord Rosse has a note on the *Merope* nebula in *Nature*, No. 384. The same number has an abstract of a lecture on navigation by Sir William Thompson. A historical account of Tycho Brahe (with a portrait) appears in the same number.

Dr. Koch, of the Leipsic Observatory, has published a micrometric investigation of the cluster G. C. 1712 for his inaugural dissertation. It contains an interesting *résumé* of previous work of this kind.

Block, of Odessa, publishes auxiliary tables for the azimuth of *Polaris*, for use with Döllén's method of time determinations.

The luminous spot on Saturn by which Hall, of Washington, determined the rotation time of the ball, was seen by Monckhoven, of Gand, December 6, at 22 h. 15 m., sidereal time, to be about central.

Ertborn, of Antwerp, publishes in the Bulletin of the Belgian Academy a series of observations on spots on Venus.

The Navy Department is printing an important paper on the rates of chronometers as affected by temperature, by Lieutenant-Commander C. H. Davis, U.S.N.

Meteorology.—The meteorology of the Libyan Desert forms the subject of the second volume of Rohlf's expedition. The editor, Dr. Jordan, finds that the diurnal barometric range is unusually large. The daily range of temperature is 24° ; the mean relative humidity at 2 P.M. is 17 per cent. Half an inch of rain fell in February—a matter of rare occurrence.

Mr. Buchan has received from the Royal Society of Edinburgh the Macdougall-Brisbane gold medal for his paper on the diurnal oscillations of the barometer.

An early copy of the report of the Treasury committee at London upon the working of the British Meteorological Office has been received during March. It recommends that ocean meteorology be transferred to the Admiralty, that the annual grant be increased, and that some aid be given to scientific investigations, as also to the Scottish Meteorological Society; also that the Council in future assume more entirely the control of the office. The report makes a Blue-book of 216 pages, the whole thoroughly indexed, and forming a valuable *résumé* of the present state of practical meteorology in England. The very voluminous evidence published by the committee shows that unfortunately none of those whom they consulted entertain any enlarged or advanced views of meteorology as a dynamical or physical study. In this respect, possibly, the evidence of Professor Airy is most interesting. He testifies that, in his opinion, meteorology can not be called a science, because as yet we have scarcely taken a step from causes to effects; that, in order to develop the science proper, there are needed more observations from more numerous stations throughout the world, by means of which to construct daily weather maps. He also points out the necessity of studying the viscosity of the air, the diffusion of vapor, the radiation of heat, and other physical properties which require experimental investigations; that, in short, what we want is a theory to apply to what we observe in the atmosphere. He is evidently loath to accord

to meteorologists that privilege of accumulating observations which astronomers have so freely enjoyed during the past five thousand years. Had the Treasury committee called to their councils some other witnesses than those they did, they could easily have been furnished with those well-established theories that have already been recognized as the basis of the true deductive science. We have ourselves for some years past urged the establishment among our American colleges of special schools and physical laboratories devoted to meteorology. These should, on the one hand, train up the experts needed as advisers to large business interests and in the army Signal-office, and, on the other, should contribute to the development of that deductive science concerning which so little seems to be known by the witnesses who testified before the Treasury committee, but which is none the less recognized by most of those who actually make the official weather predictions in Europe and America.

Dr. Buff, of Giessen, describes a method by which he attempts to make the thermo-electric pile an important meteorological instrument. He claims that it enables us to measure the greater part of that portion of the sun's rays which has not yet been converted into sensible heat. Dr. Buff's method of operating consists in exposing both ends of the pile to the temperature of the air when the needle assumes its zero position. The upper end is then exposed to any portion of the sky, when, of course, the needle indicates heat or cold, according to the position of the sun and condition of the sky. If now a plate of glass is held as a screen to this exposed end, it cuts off all rays of low refrangibility, and the needle returns partially, but never during the daytime entirely, to its zero. With a perfectly clear sky, and without the glass screen, the radiation of the exposed end caused, for instance, an indication of -50° , but protected by the glass screen, an indication of $+10^{\circ}$. On another day the blue heavens gave -30° , the glass screen $+20^{\circ}$, and the clouds $+50^{\circ}$. The ends of the pile are covered with lamp-black, whose radiation is nearly the same as that of the green leaves, and the instrument, therefore, gives a just idea of the range of temperatures to which leaves are subject. It is a most important instrument to those engaged in investigations bearing on the growth and distribution of plants, as well as to the physical meteorologist.

In *Physics*, we note this month several valuable papers. Romilly has communicated to the French Physical Society the results of his experiments on the use of a jet for aspirating and condensing gases. He finds, 1st, that the jet should be placed at a distance from the receiving tube equal to about four times the diameter of this latter tube; and 2d, that the conical opening of 6° given by Venturi for water is the best angle for air also. The first point is proved by finding that a gasometer is filled in two minutes forty seconds when the jet is placed in the interior of the receiving cone, in eight seconds when it is withdrawn a little from this cone, and in three seconds when it is removed four times the diameter of the cone. If a cone of 8° be substituted for the Venturi cone of 6° in the above experiment, sixteen seconds is required; and twenty-four seconds is necessary if only an opening in the thin walls of the vessel is used. Moreover, Romilly

finds that the maximum effect is not obtained when the jet is central. The point of maximum effect varies with the distance between the jet and cone, the locus of these points constituting an ellipse.

Frankland has presented to the Royal Society a paper on the transport of solid and liquid particles in sewer gases—a subject of great hygienic importance in reference to the zymotic and other germs whose presence is necessary to the development of epidemic diseases. In one experiment Frankland placed a solution of lithium chloride in a shallow basin, acidulated it with hydrochloric acid, and dropped in fragments of white marble. The effervescence carried off the lithium particles, and colored strongly the flame of a Bunsen burner held at the upper end of a paper tube five inches in diameter and five feet long, held vertically above the basin. A tin tube three inches wide and twelve feet long was placed above this, and the burner held over it, with the same result. The paper tube was then lengthened to nine and a half feet, and the amount of lithium present in the current seemed to be quite as great as before. The author concludes, 1st, that fresh sewage, through a properly constructed sewer, is not likely to be attended by the suspension of zymotic matters in the air of the sewer; 2d, that if the sewage be allowed to stagnate, the evolution of gas results, and the breaking of gas bubbles on the surface projects liquid particles into the air, and is a potent cause of the suspension of zymotic particles in the air of the sewer; and 3d, that it is of the greatest importance that foul liquids should pass freely and quickly through sewers and drain pipes.

Lootens has studied the phenomenon of air motion in organ pipes. By means of little pith propellers he has shown the existence in the pipe of cyclonic currents rising on one side of the pipe and falling on the other, the air producing them being that portion of the current which enters the pipe. If the pipe does not speak, this portion mixes with the other portion of the air by which the pipe is blown; but if it does speak, this cyclonic current does not mix with the other one, but takes a direction on issuing notably more inclined. These results being directly connected with the vibration of the walls of the pipe, the author concludes that this intermittent current, whose vibrations are determined by the walls of the pipe, acts the part of the perforated plate of a siren.

Ridout has described a simple burner for obtaining a very sensitive flame at feeble gas pressures. A tube five inches long and five-eighths inch wide is closed at one end by a perforated cork, through which slides a piece of tube one-eighth inch wide and six inches long, having the inner end drawn to a jet one-sixteenth inch wide. The inner tube is pushed up, the gas issuing from it lighted, and the tube slowly drawn down. A long steady flame is obtained which is quite sensitive. By arranging two such jets, and connecting the gas tubes with a horizontal tube in which is a drop of water, any difference of pressure is readily shown; lighting one jet causes motion toward the other side, as also does shortening the flame by noise.

Stoney and Moss have experimented to determine the relation of the force which moves the radiometer—and which they call "Crookes's force"

—to the tension of the residual gas, and the influence of variations in the distance between the reacting surfaces. They find that with a residual tension of five millimeters there is a reaction through a space of at least ten millimeters; that at distances of twenty to eighty millimeters the force seemed to vary inversely as the tension; and that it appeared to be nearly independent of the distance when the tension exceeded twenty millimeters. They observed, moreover, sensible deviation from the law of inverse squares at most of the tensions.

Wilson has proposed a simple mode of showing convection currents in liquids. A glass cell with flat sides has a brass tube in a depression in the bottom, which communicates with a steam supply. The tube is surrounded with a jelly containing aniline red, which is insoluble in cold water. On filling the cell with water, and blowing steam through the tube, the jelly dissolves, and colored currents stream up from below.

Guthrie has observed the curious fact that while a crystal of alum or a saturated solution of salt, when introduced into the Torricellian vacuum, depresses the mercurial column to a less extent than water, a solution of size, gum-arabic, or of any colloid depresses it to precisely the same extent. Hence water has different vapor densities in its different states of combination, which the author is now engaged in measuring.

Govi has suggested a mode of varying the focus of a microscope without touching the instrument or the object, and without altering the direction of the line of vision. This is effected by interposing between the object and the objective a glass tank with plane parallel top and bottom, in which some liquid is placed. The height of the surface is varied by means of a suitable plunger.

Thalen has published the results of a joint investigation made by Angström and himself (but not published till after the former's death) upon the spectra of the metalloids, an excellent abstract of which by Schuster appears in *Nature*. They believe it extremely improbable that any lines present in a spectrum at a lower can disappear at a higher temperature. The electric spark and the actions it may cause are carefully studied, and applied to elucidate the carbon spectrum.

Boisbaudran has given, in a plate illustrating an extended paper on gallium, an excellent representation of the spectrum of this metal, together with all the other elemental lines which are found in the same vicinity.

Becquerel has examined carefully the ultra-red portions of the spectrum, using the principle of phosphorescence for the observation of this region.

Duboseq has contrived some simple and novel optical projection experiments. By means of a lens, the image of a small round hole is thrown on a screen; between the lens and the screen an Amici direct-vision prism is placed, capable of rotation about its axis. On rotating, the spectrum is circular, red within, violet without. Using polarized light and a double-image rotating prism, the extraordinary image describes around the ordinary as a centre a luminous ring, crossed by a black line parallel to the plane of polarization. The experiment may be varied by interposing a plate of quartz.

In *Chemistry*, Hermann has made an extended investigation on the tantalum group of metals, has established the existence of ilmenium as a

distinct element, and has discovered a new metal in this group, which he calls *Neptunium*, and which has an atomic weight of 118. The mineral in which the metal was detected was columbite, from Haddam, Connecticut.

Berthelot has examined experimentally the assertion of Schönbein that, in presence of alkalis, the nitrogen of the air is oxidized to nitrous compounds by ozone. Both oxidation of phosphorus and the silent electric spark were used to produce the ozone. But while he confirmed Schönbein's statement that nitrous compounds are formed in presence of oxidizing phosphorus, the author could not obtain evidence of the oxidation of the nitrogen by the ozone.

Wright has made a careful study of the alkaloids contained in the aconite family of plants. He finds in the roots of *A. napellus* the well-crystallized aconitine; though sometimes roots purchased for those of this species yield a bitter inert base, which he calls piraconitine. An uncrystallizable base is probably also present. The alkaloid of *A. ferox* is quite unlike aconitine, and is called pseudaconitine by Wright. He suggests that the numerous uncrystallizable products said to have been obtained from aconite were produced in the processes of extraction used.

Microscopy.—Signori Lauri and Terrigi have been conducting a series of experiments upon the so-called Campagna marsh poison. They find in the endochrome of algæ growing on the Campagna and Pontine marshes minute dark granules, belonging to the group of pigmented *sphærobacteria* of Cohn (*Bacterium brunneum* of Schröter), and yielding *Monila pencillata* of Fries on cultivation, and which appear to be identical with the "pigment granules" present in the liver, spleen, and blood of persons who have suffered from malarial diseases; and by cultivating such granules from a human liver Lauri obtained a *Zoogloea*. On the basis of these observations, the prevalence of malaria at certain seasons is explained by the immense numbers of *sphærobacteria* in the air, rising from the dead and decaying algæ as the waters sink in the marshy pools, and which, swept hither and thither by the wind, excite malarial diseases when they penetrate into the human body.

The *Bacteria* of Denmark have recently been studied by Dr. Eugene Warming, and an abstract of his paper upon them is given in the *Journal of Botany*, December, 1876. [All along the Danish coast there is found, during calm weather, a red coloration of the water close to the shore, chiefly due to *Bacterium sulphuratum*, under which name are united a number of forms, appearing, 1, as spheres (*Monas vinosa*, E.); 2, as roundish bodies with constriction and granules at the ends (*Monas warmingii*, Cohn); 3, like *Monas vinosa*, but crowded with sulphur grains (*Monas erubescens*, E.); 4, long, narrow, cylindrical, and filled with sulphur grains (*Rhabdomonas rosea*, Cohn); finally, the series is closed by a spiral form. Besides these, many other species are pretty fully described.

Dr. Bessels, of the *Polaris* expedition, has given the name *Protobathybius* to a form which is considered as allied to the simple *Monera*, being drop-like masses of protoplasm, even without a nucleus, and discovered in Smith Sound; it is extremely doubtful whether this is an organism; possibly it may be only a portion of the jelly-like secretion which is produced so abundantly in the deep-water growths of the diatomaceæ.

In some researches on *Filaria hematica*, made by MM. Gatch and Pourquier, and published in *Comptes Rendus*, December 27, 1876, they found these worms in the blood of the fetus of a bitch whose heart was filled with them, but they do not explain how they traversed the double walls of the placenta in order to pass from parent to offspring.

Dr. Wallich, in the *Annals of Natural History* for February, states that certain of the so-called diatoms found by the *Challenger* expedition, and described and figured in the Proceedings of the Royal Society under the name of *Pyrocystis*, do not bear the slightest affinity to diatoms, or any thing else than true oceanic *Noctiluca*.

The anniversary address of H. C. Sorby, president of the Royal Microscopical Society, delivered February 7, is mainly devoted to the application of the microscope to geology. The object-glasses used must be of comparatively small angle, *e. g.*, a one-eighth of 75° ; large angles are positively detrimental, not only causing the object to be almost if not quite invisible, from the absence of any dark outline, but the focal point of such lenses is so near their front surface that it is quite impossible to penetrate sufficiently deep down to see the minute fluid cavities in the centre of grains of sand, or to reach the fine particles lying on the surface of the glass slip below the thickness of balsam necessitated by the presence of large grains of sand.

Anthropology.—An ethnographical museum has been opened in Helsingfors, in Finland, an anthropological society has been founded in St. Petersburg, and the fourth congress of Russian archæologists will be opened August 12 at Kazan.

Professor Flower commenced on March 9 a course of public lectures before the Royal College of Surgeons, on the "Comparative Anatomy of Man." The lectures are with reference to the anthropological bearings of the subject.

The January number of the *Journal of the Anthropological Institute* contains papers on skulls from Mallicollo and Vanikoro; on the Nicobar Islands; on D'Alberti's expedition to New Guinea; on the South-sea Islanders; on the name Mediterranean as applied to the Aryan races; and on the physical features of the Laplanders.

Matériaux for January has communications on explorations in Vézère, Certosa, Herlufsholm (Denmark), a review of Swedish antiquities, and a rich collection of news and correspondence.

M. Quatrefages has published, in Paris, a new work on anthropology, entitled *L'Espèce Humaine*.

Zoology.—The coloring matters of various animals, and especially of deep-sea forms dredged by the *Challenger*, are described by Mr. Moseley in the *Quarterly Journal of Microscopical Science*. During the voyage of the *Challenger* he made a continued series of observations with the spectroscope on the coloring matters of various invertebrate animals. The colors were examined spectroscopically in almost all cases in which an animal presented marked coloration, but usually further attention was only paid in those instances in which a spectrum presenting isolated bands was obtained, such coloring matters being of most immediate interest, because they are able to be readily identified.

Mr. Moseley's remarks, in the same paper, on phosphorescent animals are interesting. Very little if any light can penetrate from the surface

of the sea to depths such as 1000 or 2000 fathoms. Nevertheless, several facts show that at these depths light of some kind exists. Some deep-sea animals are entirely destitute of the eyes possessed by their shallow-water congeners, and appear, like the blind cave animals, to rely on touch alone, being provided with specially long antennal hairs or fine rays for the purpose of feeling. Professor Wyville Thompson and Dr. Carpenter have suggested that phosphorescent animals form the source of light in the deep sea. Mr. Moseley seems to adopt this rather absurd view, and he adds that "it seems certain that the deep sea must be lighted here and there by greater or smaller patches of luminous Alcyonarians, with wide intervals probably of total darkness intervening. Very possibly the animals with eyes congregate around these sources of light."

The fresh-water rhizopods, a favorite subject of inquiry, have been studied with great care by Hertwig, Lesser, and Bütschli. An abstract of their works has been given by Mr. Archer in the *Quarterly Journal of Microscopical Science*, the third part appearing in the January number.

It appears that tape-worms may occur abundantly in the intestines of rabbits, as stated by Mr. G. J. Romanes in *Nature*. This is an unexpected fact, since the rabbit is purely a herbivorous animal. The fact is explained by Mr. R. D. Turner in a letter to *Nature* (February 15), who says: "I would suggest that the tape-worm referred to by Mr. G. J. Romanes is like the *Bothriocephalus* of man, perhaps a species of the same genus. This is not supposed to have a cystic state, but to be developed from a ciliated embryo taken into the system in raw or badly cooked vegetables which have been watered by sewage from cess-pools, in which the eggs will remain alive for months. In the same way the eggs of the rabbit's tape-worm probably remain in the animal's droppings till set free in rain as ciliated embryos. As the rabbit feeds on the vegetation watered by such rain, there is no difficulty in understanding how the embryos would reach his alimentary canal."

Mr. H. N. Moseley, naturalist on board the *Challenger* during her three years' cruise, has given an account of two new and remarkable species of deep-sea Ascidians. One of them, *Hybythius calycodes*, was brought up from the North Pacific from a depth of 2900 fathoms. It is stalked and cup-shaped, and is believed to be allied to *Boltenia*. It differs from that genus, however, in possessing a series of cartilaginous plates symmetrically developed in the soft test. The second species, *Octanemus bythius*, was brought up from a depth of 1070 fathoms. It is star-shaped, with eight rays. The gill sac is nearly absent in it, and the usual gill net-work entirely so. Muscular prolongations of the tunic run into the curious conical protuberances of the test. The nucleus is contracted and small, like that of *Salpa*. This singular species is believed to be without living allies.

Professor Semper has published an interesting volume upon the supposed homologies in the structure of articulated animals and vertebrates. With how much success his thesis has been sustained remains to be seen.

A notable essay on median and paired fins, by James K. Thatcher, with many illustrations, appears in the Transactions of the Connecticut Academy.

Professor D. S. Jordan and H. E. Copeland's check list of the fishes of the fresh waters of North America has been completed, and is published in the Bulletin of the Buffalo Society of Natural Sciences.

Mr. Frank Buckland has stated that "a salmon [*Salmo salar*?] does not breed every year, but every three years." He has not brought forward any facts in support of this view, but this is his impression. An anonymous writer in *Nature* for March 1 considers, as the only unsolved problem in connection with the habits of the salmon, whether the same fish spawns annually, once in two years, or once in three years.

Eleven new species of birds from Duke of York Island and adjoining parts of New Ireland and New Britain have been described by Mr. P. L. Selater.

Botany.—We have to record in botany the appearance of the twenty-seventh and twenty-eighth reports of the botanist of the State of New York, Mr. Charles H. Peck, containing several plates of fungi; a paper on the "Tree in Winter," by Frederick Brendel, M.D., and one on "Parasitic Fungi," by T. J. Burrill, in the Bulletin of the Illinois Museum of Natural History; and a paper on the flora of Ann Arbor and vicinity, in the Proceedings of the Ann Arbor Scientific Association.

In *Hedwigia* are mycological papers by Niessl and Körnicke, and in *Flora* Dr. J. Müller describes some Mexican lichens.

The *Annales des Sciences Naturelles* contains papers of unusual interest. Bescherel'e gives an account of the bryology of the French Antilles. Durin has an article on the "Transformation of Crystallizable Sugar into Cellulose Products," and on the office of sugar in vegetation. He finds that there are ferments which have the property of converting crystallizable sugar into cellulose and glucose, and he regards the cellulose of plants as the product of the decomposition of sugar. He also shows the important part which calcic carbonate plays in the cellulose fermentation, and its uses in vegetation. Dehérain and Vesque publish their researches on the respiration of roots. They arrive at the following results: first, that it is not only necessary that the leaves of living plants should have access to air, but that the roots themselves should find free oxygen in the soil; secondly, that the absorption of oxygen by the root is accompanied by only a feeble evolution of carbonic acid; thirdly, that this evolution of carbonic acid is a phenomenon attending the circulation of gas in the plant, not a product of decomposition of any organ. Vesque, in an article reviewing a paper by Geleznov on the "Water in the Stems of Ligneous Plants," finds that in plants where the wood is drier than the bark, what he calls the transpiratory reserve does not exceed a fixed limit; where the wood is moister than the bark, the transpiratory reserve is inexhaustible. There are some trees in which at some seasons the bark is moister than the wood, and at other seasons just the reverse. Bureau and Poisson examined the soil from a cave in Mauritius, and although it was of a yellow color, it was found to consist not of sulphur, but of fern spores, probably of some of the *Cyatheæ*.

Professor P. Van Tieghem, of the École Normale, has been elected a member of the French Academy, in the place of the late Professor Bronghniart.

Botanical science has met with a great loss in the deaths of Professor William Hofmeister, of Tübingen, and Professor Joseph De Notaris, who died at Rome. The former will be remembered as the author of a classic work on the develop-

ment of the higher cryptogams, and of a work on the structure of the vegetable cell. He is to be succeeded by Professor Schwendener, of Bale. Professor De Notaris was a fertile writer on bryological and mycological subjects.

Editor's Historical Record.

POLITICAL.

OUR Record is closed on the 24th of April.—President Hayes's Southern policy has been carried into effect. On the 22d of March a cabinet meeting was held, and it was determined to invite Governors Hampton and Chamberlain to come to Washington in order that the views of each might be fully considered. The invitation was accepted. On the 2d of April an order was issued by the President for the evacuation of the South Carolina State-house by the United States troops, the withdrawal to take place on the 10th. In the mean time a Commission was appointed, consisting of Judge Charles B. Lawrence, of Illinois, ex-Governor J. C. Brown, of Tennessee, General Joseph R. Hawley, of Connecticut, General John M. Harlan, of Kentucky, and Wayne M'Veagh, of Pennsylvania, to visit Louisiana and to consider and report to the President what were "the real impediments to regular legal and peaceful proceedings under the laws and Constitution of the State of Louisiana, by which the anomalies in government there presented may be put in course of settlement without involving the element of military power as either an agent or make-weight in such solution." The instructions to the Commission contemplated also effort on their part—if the obstacles to any other solution should prove insuperable—to "accomplish the recognition of a single Legislature as the depository of the representative will of the people of Louisiana." This latter object was accomplished, and on the 19th of April the Commission was able to inform the President of the existence in Louisiana of a valid Legislature with an undisputed quorum. On the 20th, the President issued an order for the withdrawal of the United States troops from the Orleans Hotel, in the vicinity of the building used by Governor Packard as a State-house. This order was carried into effect on the 24th. The withdrawal of Federal troops in South Carolina and Louisiana involves the overthrow of the governments in those States which were supported by the Republican party. The Louisiana Legislature, April 24, almost unanimously elected Judge H. M. Spofford United States Senator.

The State election in Rhode Island, April 4, resulted in the success of the Republican State ticket.

President Hayes has authorized the expenditure of \$904,000, under the direction of the Chief of Engineers, for the improvement of rivers and harbors.

By direction of the President an order was issued, April 10, for the removal of the United States troops from the Territory of Alaska.

A bill prohibiting pool-selling on horse-races was passed by the New York Senate, April 24.

John D. Lee was shot, March 23, at Mountain Meadows, as a punishment for the massacre perpetrated at that place twenty years ago.

The depression of trade in Germany has assumed serious proportions.

Prince Bismarck has received a few months' leave of absence from his official duties. He consents to remain in office, being represented during his absence by Herr Hofmann, in the Department of Home Affairs, by Herr Von Bülow in the Department of Foreign Affairs, and by Herr Camphausen in the Prussian cabinet.

General Von Moltke, in the German Parliament, April 24, stated that the French military budget exceeded the German by 150,000,000 francs a year, exclusive of extraordinary grants. He declared that, much as he desired peace, he did not believe in it.

The Russian invasion of Turkey has been determined upon. The protocol—inviting the Porte to consolidate pacification by replacing its armies on a peace footing, and by putting in hand, with the least possible delay, the reforms necessary for the tranquillity and well-being of the provinces—was signed at London by the great powers on the 31st of March. The Porte's reply to the protocol was delivered April 10, defiantly rejecting foreign interference in the internal affairs of Turkey. Since that date both Turkey and Russia have been energetically preparing for war. It is reported that a secret alliance exists between Russia and Persia. Russian troops crossed the Pruth April 23, and occupied Jassy and Bucharest. War was declared by Russia on the 24th. On that day the Czar's manifesto and Prince Gortchakoff's circular were published, both throwing the responsibility for war upon Turkey. Seventeen thousand Russians entered Roumania on the night of the 23d.

DISASTERS.

March 27.—The Staffordville reservoir, on the east branch of the Willimantic River, in the north-east part of Connecticut, gave way, causing great destruction of property.

April 11.—Burning of the Southern Hotel, in St. Louis, Missouri. Fifteen lives lost.

April 13.—Burning of the steam-ship *Leo*, from Savannah for Nassau. Three passengers and eighteen of the crew supposed to be lost.

OBITUARY.

April 3.—In New York city, Captain Frederick Lahrbush, of the British army, supposed to be one hundred and eleven years of age.

April 8.—In New York city, the Rev. William A. Muhlenberg, D.D., aged eighty years.

April 11.—In Baltimore, Maryland, Ross Winans, the distinguished machinist and inventor, aged eighty years.

March 26.—A cable dispatch announces the death, in England, of Walter Bagehot, author of *Lombard Street* and other financial and political works.

Editor's Drawer.

A N Episcopal clergyman in Connecticut relates a couple of incidents aptly illustrating the embarrassments under which gentlemen of the cloth are often placed, provided they are gifted with a keen appreciation of the humorous. Every one has felt a tendency on occasions of solemnity to laugh at the slightest incident calculated to provoke mirth, and the worthy rector of — parish shares this feeling in common with his lay brethren. From his elevated position of course every movement among his hearers is noticeable, and he confesses that it often requires an effort to preserve a sedate countenance when witnessing the tricks of restless urchins or the actions of eccentric individuals.

The instances to which he refers as particularly amusing were due to the presence of dogs, which appear to have an unaccountable liking for churches. During the early part of the services on a Sunday in Lent, a saucy-looking, frisky little cur slipped along up the main aisle, and encountered a hat just outside of one of the pew doors. He first smelled of it cautiously, then nosed it around for a moment, and finally, picking it up in his mouth, shook it vigorously. By this time several persons had their eyes on the dog, and the sexton came tiptoeing up the aisle in pursuit, while the owner of the hat seized his cane and poked at the animal. Finding his situation uncomfortable, the cur trotted leisurely up the aisle to the platform, thence along to and down a side aisle, shaking the hat all the way with evident satisfaction. The sexton summoned assistance, and an energetic but quiet chase was organized, so as not to disturb the services, to which, however, few in the congregation were now giving attention. Nearly every face in the house was either lighted up by a smile or distorted by a grin, and the clergyman had a hard struggle to restrain his emotions as he witnessed the clever way in which the dog again and again dodged his pursuers, still clinging to the hat, which was by this time only a wreck of its former self. Finally, the cur made his escape through an opened door, and order was restored. But the climax, for the clergyman at least, came a moment later, when, in continuing his reading, he encountered a warning reference to dogs—Matthew, xv. 26. In running his eye down the page he fortunately detected it before the words came to his lips, and like a flash the thought occurred to him that to read this, after what had happened, could not fail to provoke merriment both on his own part and that of his hearers. As the best course out of the dilemma, therefore, he skipped the objectionable sentence, and none of his hearers suspected the true reason of his strange expression of countenance and faltering tone at the time. He had conquered, but not wishing to endure a second trial, gave the sexton rigid orders for the future concerning dogs.

Only a few weeks afterward, however, and while the affair above related was still fresh in his memory, another adventure of the same nature occurred. A country couple came into the city to be married, and the service was performed in the church. Accompanying the couple was a brother of the bridegroom, who brought a dog with him, the groom having one also, and both having escaped the notice of the sexton. The

brother seated himself in a front pew, and undertook the task of keeping both dogs quiet. At first they were in the aisle, but eventually the brother lured his own dog into the pew, and placing the animal's head between his knees, held him fast. Then he endeavored to entice the other into the pew by snapping his fingers softly and uttering low whistles, all of which the clergyman could not avoid noticing. The stray animal would come as far as the pew door, but then, seeing the scrape in which his companion had become involved by overconfidence, would turn tail and trot away. Then followed a renewal of the whistling and finger-snapping, until at last the clergyman could endure it no longer, and cutting the ceremony as short as possible, fled to a side room where he could give vent to his feelings. He says that since these two affairs he has never ventured to proceed with a service when a dog was any where in sight, for it would be impossible for him to keep his mind concentrated on his duties.

MR. OSCANYAN, in his book *The Sultan and his People*, tells the following anecdote of a Turkish physician, whose prescriptions and method of treatment will interest practitioners in New York:

A person exceedingly ill of typhus fever called in one of these medical gentlemen, who, although he considered the case quite hopeless, prescribed for his patient, and took his leave. The next day, in passing by, he inquired of a servant at the door if his master was not dead. "Dead! No; he is much better." Whereupon the doctor proceeded up stairs to obtain the solution of this miracle. "Why," said the convalescent, "I was consumed with thirst, and I drank a pailful of the juice of pickled cabbage."

"Wonderful!" quoth the doctor. And out came the tablets, on which the physician made this inscription, "Cured of typhus fever, Mehemed Agha, an upholsterer, by drinking a pailful of pickled cabbage juice."

Soon after, the doctor was called to another patient, a yaghlikgee, or dealer in embroidered handkerchiefs, suffering from the same malady. He forthwith prescribed "a pailful of pickled cabbage juice."

On calling the next day to congratulate his patient on his recovery, he was astonished to be told the man was dead. The Oriental Æsculapius, in his bewilderment at these phenomena, came to the safe conclusion, and duly noted it in his memoranda, that "although in cases of typhus fever *pickled cabbage juice* is an efficient remedy, it is not, however, to be used *unless the patient be by profession an upholsterer.*"

THE following was caught by the writer on the street of a quiet Western village: It was the evening of a damp and chilly day, one of the thoroughly uncomfortable days not uncommon in those parts in April or November, which give to the reflections of even a healthy and vigorous-minded man a somewhat "sober coloring." Two boys—one of a delicate frame, thin and pale face, perhaps ten years old, and with the air of a newcomer in the place; the other younger by several years, of stout build, ruddy and cheerful face—

have met seemingly for the first time, and are talking brokenly.

YOUNGER BOY (*evidently interested in his new acquaintance*). "Where do you live?"

OLDER BOY (*with a vacant, melancholy look into the street*). "I don't live."

"What do you do?"

"I board."

HOW DEACON BROWN CONVERTED THE EDITOR OF THE WATERLOO "AVALANCHE."

GENERAL JEFFERSON SNAUGHTER was just the man to edit a paper in a frontier town. He had seen some hard service in the Confederate army; had knocked about the country generally since the war; was a graduate of the Charlottesville University; could write a clever article on subjects of which he was utterly ignorant; played a stiff game of poker; and was essentially a fighting man, having, if report spoke truly, killed three or four personal friends in the course of a somewhat limited residence in Texas.

When he arrived at Waterloo last May, and

But General Jefferson Snaughtier was one of the men who never forget and never forgive. The very first number of the *Avalanche* contained a scorching leader devoted to the good deacon, and scarcely a day passed but that holy man was in some manner vituperated in the columns of Waterloo's only paper. Now Deacon Brown, a leading member of the church, was much respected and loved by his fellow-citizens. He drove a thriving business as a wholesale and retail liquor dealer, on the corner of Washington and Myrtle streets. On week-days his store was a favorite resort for his brother church members, and a sort of club for the towns-people generally.

Previous to the establishment of the *Avalanche* all the foreign and domestic news was disseminated among the inhabitants of Waterloo from this centre.

The violent attacks on Deacon Brown daily printed by General Snaughtier were much commented on in Waterloo. Scarcely any one approved of them, and yet nobody dared to take such a desperado to task. General Snaughtier

CHIVALROUS YOUTH. "Now then, Ladies, sit steady, please, and away we go. One!—two!!—

"Three!!!"

announced his intention of starting a daily paper, every body was charmed.

Waterloo had no end of drinking saloons and gambling houses, two churches, and a telegraph office, but no paper. As General Snaughtier stalked about town in leather breeches and Wellington boots, a Mexican sombrero on the top of his head, and a bright red sash around his waist, his silver spurs ringing at every step, he struck the whole population of Waterloo as a man singularly fitted to adorn the editorial chair.

The general was in search of a suitable building in which to start the Waterloo *Avalanche*.

Deacon Brown, the most important and by far the richest man in Waterloo, owned a row of brick stores on the west side of Washington Street, between Myrtle and Spruce Streets. One of these General Snaughtier desired to rent, but the deacon declined to lease without receiving a quarter's rent in advance.

"Sir-r-r!" said Snaughtier. "Do you know who I am? Pay in advance, indeed! I never, in the whole course of a somewhat checkered life, have been asked to pay in advance, and I certainly shall not begin now."

The deacon, one of the mildest and most gentle of men, felt very much embarrassed, and stammered out—for he suffered from an impediment of speech—"N-n-no offense, I ho-ho-hope, general."

was the only survivor of four brothers, who all "died in their boots," leaving bloody records behind them. The third brother, Colonel Randolph Snaughtier, it will be remembered, came to his death at the hands of Major-General Brown while engaged in a "quiet" game of cards summer before last at the Greenbrier White Sulphur Springs, Virginia. The tragic occurrence was much talked of at the time. All this was well known at Waterloo.

The good deacon paid no attention to the calumnies in the *Avalanche*, which increased in violence. Elder Roberts had endeavored to talk the matter over with him in a friendly way, hoping to induce the deacon to hold out the olive-branch, and thus put an end to the general's attacks, which, it was feared, might end in personal violence on the part of Snaughtier. But all he could elicit from the deacon was this: "The g-g-general is a ch-ch-child of wrath, but I do-do-don't consider him a da-da-dangerous man."

Thus matters stood till the beginning of July, when Snaughtier, in an editorial on the religious revival of Moody and Sankey, took occasion to speak as follows: "We know no one more in need of the religious ministrations of these good men than that precious old scoundrel Deacon Brown. Even whiskey won't revive him. He has tried that for the last twenty-five years. If the whiskey he has

drunk during this period could be collected together, it would form a lake sufficiently large to drown the entire congregation who have been so long deluded, cheated, and gulled by this precious deacon—this toddy-soaked old hypocrite."

At about eleven o'clock of the day on which

cing out, with a fierce bull-dog look. "Well, Sir-r-r, what can I do for you, Sir-r-r?"

"No-no-nothing, general; I me-me-merely wished—"

"Come, come, Sir-r-r, make it short; I can't stop here all day listening to your stuttering."

this article appeared, Deacon Brown walked into the office of the *Waterloo Avalanche*, and asked the small boy in charge whether General Slaughter was at leisure. No, the general was engaged, and could see no one. The deacon modestly took a chair, saying, "I'll wa-wa-wait."

In about half an hour the general came boun-

"Yes, ge-ge-general, I'll make it as shor-shor-short as po-po-possible." And taking the morning's paper from his pocket, he pointed to the obnoxious article, and asked the general if he wrote it.

"Of course I did. What of it?"

In less than two seconds the deacon had the

general by the back of the neck; and drawing a stout rawhide from his pocket, laid it on with such vigor that the general screamed and roared for quarter. When he thought he had punished him sufficiently, the deacon jerked him into one corner of the office, saying, "I have ma-ma-made it as short as po-po-possible, general, but when you are mo-mo-more at leisure, and can spare me a few mo-mo-moments, I shall be happy to renew this co-co-conversation."

The news spread through Waterloo like wild-fire, and the deacon's friends crowded to see and congratulate him. But they were fearful of the vengeance of General Snaught, and begged the deacon not to venture upon the street unarmed. Deacon Brown would not encumber himself with either bowie-knife or revolver. He smiled pleasantly, and said, "The ge-ge-general is a ch-ch-child of wrath, but I do-do-don't consider him a dangerous ma-ma-man."

All this happened on Tuesday. On the following Sunday morning, greatly to the surprise of Waterloo, Deacon Brown and General Snaught were seen to emerge from the former's house, and proceed arm in arm in the direction of the church, where the general sat in the deacon's pew, joined heartily in the singing, listened to the sermon with the deepest attention, and gave liberally to the collection.

The conversion was effectual.

WHISTLING IN HEAVEN.

You're surprised that I ever should say so?
Just wait till the reason I've given
Why I say I sha'n't care for the music,
Unless there is whistling in heaven;
Then you'll think it no very great wonder,
Nor so strange, nor so bold a conceit,
That unless there's a boy there a-whistling,
Its music will not be complete.

It was late in the autumn of '40;
We had come from our far Eastern home
Just in season to build us a cabin,
Ere the cold of the winter should come;
And we lived all the while in our wagon,
That husband was clearing the place
Where the house was to stand; and the clearing
And building it took many days.

So that our heads were scarce sheltered
In under its roof, when our store
Of provisions was almost exhausted,
And husband must journey for more;
And the nearest place where he could get them
Was yet such a distance away,
That it forced him from home to be absent
At least a whole night and a day.

You see, we'd but two or three neighbors,
And the nearest was more than a mile,
And we hadn't found time yet to know them,
For we had been busy the while;
And the man who had helped at the raising
Just staid till the job was well done;
And as soon as his money was paid him,
Had shouldered his axe and had gone.

Well, husband just kissed me and started.
I could scarcely suppress a deep groan
At the thought of remaining with baby
So long in the house all alone;
For, my dear, I was childish and timid,
And braver ones might well have feared,
For the wild wolf was often heard howling,
And savages sometimes appeared.

But I smothered my grief and my terror
Till husband was off on his ride,
And then in my arms I took Josey,
And all the day long sat and cried,
As I thought of the long dreary hours
When the darkness of night should fall,
And I was so utterly helpless,
With no one in reach of my call!

And when the night came with its terrors,
To hide ev'ry ray of light,
I hung up a quilt by the window,
And, almost dead with affright,
I kneeled by the side of the cradle,
Scarce daring to draw a full breath,
Lest the baby should wake, and its crying
Should bring us a horrible death.

There I knelt until late in the evening,
And scarcely an inch had I stirred,
When suddenly, far in the distance,
A sound as of whistling I heard.
I started up, dreadfully frightened,
For fear 'twas an Indian's call;
And then very soon I remembered
The red man ne'er whistles at all.

And when I was sure 'twas a white man,
I thought, were he coming for ill,
He'd surely approach with more caution—
Would come without warning and still.
Then the sounds coming nearer and nearer,
Took the form of a tune, light and gay,
And I knew I needn't fear evil
From one who could whistle that way.

Very soon I heard footsteps approaching,
Then came a peculiar dull thump,
As if some one was heavily striking
An axe in the top of a stump;
And then, in another brief moment,
There came a light tap on the door,
When quickly I undid the fast'nings,
And in stepped a boy, and before

There was either a question or answer,
Or either had time to speak,
I just threw my glad arms around him,
And gave him a kiss on the cheek.
Then I started back, scared at my boldness,
But he only smiled at my fright,
As he said, "I'm your neighbor's boy, Elick,
Come to tarry with you through the night.

"We saw your husband go eastward,
And made up our minds where he'd gone,
And I said to the rest of our people,
'That woman is there all alone,
And I venture she's awfully lonesome,
And though she may have no great fear,
I think she would feel a bit safer
If only a boy were but near.'

"So, taking my axe on my shoulder,
For fear that a savage might stray
Across my path, and need scalping,
I started right down this way;
And coming in sight of the cabin,
And thinking to save you alarm,
I whistled a tune, just to show you
I didn't intend any harm.

"And so here I am, at your service;
But if you don't want me to stay,
Why, all you need do is to say so,
And should'ring my axe, I'll away."
I dropped in a chair and near fainted,
Just at thought of his leaving me then,
And his eye gave a knowing bright twinkle
As he said, "I guess I'll remain."

And then I just sat there and told him
How terribly frightened I'd been,
How his face was to me the most welcome
Of any I ever had seen;
And then I lay down with the baby,
And slept all the blessed night through,
For I felt I was safe from all danger
Near so brave a young fellow and true.

So now, my dear friend, do you wonder,
Since such a good reason I've given,
Why I say I sha'n't care for the music
Unless there is whistling in heaven?
Yes, often I've said so in earnest,
And now what I've said I repeat,
That unless there's a boy there a-whistling,
Its music will not be complete.

THIS, by Edmund Yates, is quite opulent:

"Lespes, the great barber of Paris, is in trouble. A year or so ago he obtained the order of Christ of Portugal—how, no man but himself, with perhaps one other, knows; but the administration of the Legion of Honor, which is su-

preme in these matters, would never suffer him to wear it. He nevertheless passed the ribbon through his button-hole, and he has just had to pay five hundred francs for that pleasure, in the way of a fine imposed by the Tribunal of Correc-

A BOWERY SKETCH FROM NATURE.

"Here y'are. Mushtarchers on'y fl' cents. Makes yer look like a real man!"

tional Police. His point is that those who made him a knight knew he was a barber, and that, having done nothing unworthy of either his new profession or his old one, the honor ought not to be taken away. He is, moreover, on the best terms with the court of Portugal, her Majesty the Queen having recently deigned to accept his humble offering of two bottles of the finest perfume. There is, however, some reason to believe that this friendly disposition of the crown is not shared by its representative at Paris.

"After all, what have you done for Portugal?" said a member of the embassy, to whom Lespes appealed, the other day.

"What have I done for Portugal? Have I not shaved you?"

THE Drawer has now and then published a few original specimens of sermonizing, such as the one entitled "He played on a harp of a thousand strings," and "His feet shall be like hen's feet," etc., but none of them had the fine humor of the following, by a Dr. Dodd, prebend of Brecon, to some under-graduates of Cambridge, who chanced to meet the reverend doctor a few miles from that town, and who insisted on his preaching to them on the word "malt" from the trunk of a hollow tree that stood close by. We may state that Dr. Dodd had made himself obnoxious to many of the Cantabs by frequently preaching against drunkenness. His impromptu discourse ran as follows:

"Beloved, let me crave your attention. I am a little man, come at a short warning to preach a short sermon, from a small subject, in an unworthy pulpit, to a slender congregation. Beloved, my text is 'Malt.' I can not divide it into words, it being but one; nor into syllables, it being but one; I must, therefore, of necessity divide it into letters, which I find it to be these four, M A L T. M, my beloved, is Moral; A is Allegorical; L, Literal; and T, Theological. The Moral is set forth to teach you drunkards good manners; therefore M, masters—A, all of you—L, listen—T, to my text. The Allegorical is when one thing is spoken and another thing is meant. The thing spoken of is malt; the thing meant is the juice of malt, which you Cantabs make, M, your master—A, your apparel—L, your liberty—and T, your trust. The Literal is, according to the letter, M, much—A, ale—L, little—T, trust. The Theological is according to the effects that it works; and these I find to be of two kinds: first, in this world; secondly, in the world to come. The effects that it works in this world are in some, M, murder—in others, A, adultery—in all, L, looseness of life—and in some, T, treason. The effects that it works in the world to come are, M, misery—A, anguish—L, lamentation—and T, torment. And so much for this time and text. I shall improve this first by way of exhortation. M, masters—A, all of you—L, leave off—T, tippling; or secondly, by way of excommunication, M, masters—A, all of you—L, look for—T, torment; thirdly, by way of caution, take this: a drunkard is the annoyance of modesty, the spoil of civility, the destruction of reason, the brewer's agent, the ale-house's benefactor, his wife's sorrow, his children's trouble, his own shame, his neighbor's scoff, a walking swill bowl, the picture

A COMICAL COMPLIMENT.

VISITOR. "I do declare, Mrs. Fondle, your child is really growing prettier than my own little beauty!"

of a beast, and the monster of a man. Now to," etc.

If all sermons were as forcible and yet as brief as this, there would never, we think, have been any occasion for Sydney Smith—who, by-the-bye, was canon of St. Paul's when Barham was minor canon.

HARPER'S NEW MONTHLY MAGAZINE.

No. CCCXXVI.—JULY, 1877.—Vol. LV.

ON A NAUGHTY LITTLE BOY, SLEEPING.

Just now I missed from hall and stair
A joyful treble that had grown
As dear to me as that grave tone
That tells the world my older care.

And little footsteps on the floor
Were stayed. I laid aside my pen,
Forgot my theme, and listened—then
Stole softly to the library door.

No sight! no sound!—a moment's freak
Of fancy thrilled my pulses through:
"If—no"—and yet, that fancy drew
A father's blood from heart and cheek.

And then—I found him! There he lay,
Surprised by sleep, caught in the act,
The rosy Vandal who had sacked
His little town, and thought it play:

The shattered vase; the broken jar;
A match still smouldering on the floor;

The inkstand's purple pool of gore;
The chessmen scattered near and far.

Strewn leaves of albums lightly pressed
This wicked "Baby of the Woods:"

In fact, of half the household goods
This son and heir was seized—possessed.

Yet all in vain, for sleep had caught
The hand that reached, the feet that strayed;
And fallen in that ambushade
The victor was himself o'erwrought.

What though torn leaves and tattered book
Still testified his deep disgrace!

I stooped and kissed the inky face,
With its demure and calm outlook.

Then back I stole, and half beguiled
My guilt, in trust that when my sleep
Should come, there might be One who'd keep
An equal mercy for His child.

SNOW BANNERS OF THE CALIFORNIAN ALPS.

THE crown of the Sierra, decorated with streaming snow banners, was the most sublime storm phenomenon I ever witnessed in the Alps, far surpassing in plain, downright grandeur all the most imposing effects of clouds, floods, and avalanches.

The snow out of which these banners are formed is heaped most bountifully upon the Alps winter after winter, sometimes to a depth of twenty or thirty feet; but it does not come from the sky in the form of big feathery flakes, such as one sees in calmer and more temperate regions, seldom even in the form of complete crystals. For many of these starry blossoms fall before they are ripe, while most of those that do attain perfect development as six-petaled flowers glint against one another in their fall, and are broken into irregular fragments.

This dry, mealy, fragmentary snow is still farther prepared for the formation of banners by the action of the wind. For instead of at once finding rest, like that which falls into the tranquil depths of the forest zones, it is rolled over and over, beaten against bare, jagged rocks, and swirled in pits and hollows, like sand in the pot-holes of a river, until finally the keen crystal angles of the fragments are worn off, and the whole is reduced to dust.

Wherever strong storm winds find this light, well-ground snow dust in a loose condition, upon exposed slopes where there is a free upward sweep, it is tossed back into the sky, and borne onward from peak to peak in the form of banners or cloud-shaped drifts, according to the velocity of the winds and conformation of the slopes upon which they are deflected.

While thus flying through the dry, frosty air, a small portion makes good its escape, and remains in the sky as vapor, for evaporation never wholly ceases even in the most rigorous weather. But by far the greater part, after being driven into the sky again and again, is at length locked fast in firm, bossy drifts or in the wombs of glaciers, some of it to remain silent and rigid for many years ere it is finally melted into music, and sent a-flowing and singing down the mountain-side to the sea.

Yet notwithstanding the abundance of winter snow dust in the Alps, and the frequency of comparatively high winds, and the length of time that the dust remains loose and fully exposed to their action, the production of well-formed banners is, for causes we shall hereafter see, of quite rare occurrence. Indeed, during five winters spent in the Sierra, I have observed only one display of this kind that seemed in every way perfect. This was in 1873, when the

snow-laden Alps were swept lengthwise by a powerful norther. I happened to be wintering in Yosemite Valley at the time, that sublime Sierra stronghold, in which one may witness the creation of those forms of storm grandeur that are termed wonderful, almost every day—storms of sunshine, storms of snow, floods, avalanches, changing waterfalls, changing clouds. Yet even here the grand gala day of the north wind seemed surpassingly glorious.

I was awakened in the early morning by the rocking of my cabin and the beating of pine burs on the roof. Detached torrents and avalanches from the main wind-flood overhead were rushing wildly adown the narrow side cañons and over the rugged edges of the walls with loud-resounding roar, arousing the giant pines to magnificent activity, and making the entire granite valley throb and tremble like an instrument that was being played.

But afar on the lofty Alps the storm was expressing itself in still grander characters, which I was soon to see in all their glory.

I had long been anxious to study some points in the structure of the ice cone that is formed every winter at the foot of the main Yosemite Fall, but the blinding spray by which it is invested had prevented me from making a sufficiently near approach. This morning, however, the entire body of the fall was torn into gauzy strips, and blown horizontally along the face of the cliff, leaving the cone entirely dry. And while making my way to the top of an over-looking ledge to seize so favorable an opportunity of examining the interior structure of the cone, the peaks of the Merced group showed themselves over the shoulder of the South Dome, each waving a resplendent banner against the blue sky, as regular in form and as firm in texture as if woven of fine silk. So perfectly glorious a phenomenon of course overbore all other considerations, and I at once began to force my way out of the valley to some dome or ridge sufficiently lofty to command a general view of the main Alpine summits, feeling assured I should find them bannered still more gloriously. Nor was I in the least disappointed.

The side cañon by which I ascended was choked with snow that had been shot down in avalanches from the shelving walls on either side, rendering the climbing exceedingly difficult. But, inspired by the grand vision atop, the most tedious scrambling brought no fatigue, and in four or five hours I stood beyond the walls, upon a ridge eight thousand feet high.

And there, in bold relief, like a clear paint-

ing on the sky, appeared one of the most imposing spectacles the eye of man ever beheld. Alps innumerable, black and jagged, rising sharply into the azure, their bases set in solid white, their sides streaked with snow, like an ocean rock with foam; and from every summit, all free and unconfused, a streaming banner, from two to six thousand feet in length, slender at the point of

tempestuous roar; but you feel not its violence, for you are looking through a calm, sheltered opening in the woods, as through a window. There, in the immediate foreground of your picture, rises a majestic forest of silver-firs, blooming in eternal freshness, their foliage warm yellow-green, and the smooth snow cloth beneath them thick-strewn with their beautiful plumes. Be-

THE SNOW BANNERS.

attachment, then widening gradually as it extended from the peak, until about a thousand or fifteen hundred feet in breadth. The colossal cluster of peaks called "The Crown of the Sierra," and the majestic ranks marshaled along the axis to the north and south, Mounts Ritter, Lyell, M'Clure, the Matterhorn, with their nameless compeers, each with its own refulgent banner waving with a clearly visible motion in the sun-glow, with not a single lightning-bolt to mar the sublime simplicity of the wind tones, not a single cloud in the sky to mar the simple grandeur of the banners.

And now, reader, come with a clear mind for a few moments and fancy yourself standing on this Yosemite ridge, looking with your own eyes; for I assure you there is nothing to which I can point your attention within the whole range of Alpine phenomena that is more impressively sublime.

You are looking eastward. You notice a strange garish glitter in the air, and the gale drives wildly overhead with a loud

yond, and extending over all the middle ground, are sombre forests of pine interrupted by huge swelling ridges and domes; and just beyond the dark upturned edges of the forest you behold the clustered monarchs of the Alps waving their majestic banners. They are twenty miles away, but you would not wish them nearer, for every feature is distinct, and the whole is seen in its right proportions, like a well-hung picture on a parlor wall.

And now, after thus taking a full general view, mark how sharply the black snowless ribs and buttresses and precipitous summits of each peak are defined, excepting the portions veiled by the banners, and how delicately their sides are streaked with snow where it has come to rest in narrow flutings and gorges. Mark, too, how grandly the banners wave as the wind flood is deflected against their ample folds, and how trimly each is attached to the very summit of its peak, like a streamer at a mast-head. How smooth and silky they are in texture, and

how exquisitely their fading fringes are penciled upon the azure! See how close and opaque they are toward the point of attachment, yet so filmy and translucent toward the end, you see the peaks dimly beyond, as if looking through ground glass. Yet again observe how some of the longest belonging to the loftiest summits stream perfectly free all the way across the intervening notches from peak to peak, while others pass and overlap each other. And consider how every particle of this wondrous snow cloth is flashing out jets of light, like a diamond.

These are chief features of the picture as seen from the forest window, and it would still be a surpassingly glorious one were the whole of the fore and middle grounds, with their domes and forests, obliterated altogether, leaving only the black peaks, the white banners, and the blue sky on which they are painted.

Glancing now at the formation of snow banners in a general way, we find that the main causes of the wondrous perfection of those we have been contemplating were the favorable direction and great force of the wind, the abundance of snow dust, and the peculiar conformation of the peaks. It is

VERTICAL SECTION, NORTH AND SOUTH, THROUGH A SUMMIT PEAK.

essential not only that the wind move with great velocity to supply a sufficiently copious stream of dust, but that it shall come from the *north*. No perfect snow banner ever streams northward from the peaks of the Californian Alps. Had the gale to-day blown from the south, leaving other conditions unchanged, only a dull, confused, fog-like drift would have been produced; for the snow, instead of being spouted up at the tops of the peaks in a condensed current to be drawn out as streamers, would have been shed off around the sides and piled down into the glacier wombs. The regularity and distinctness of form observed in these banners is one of their most striking characteristics. Any one not possessed of the secret of their formation would naturally be led to guess that when the peaks were laden with loose snow, a sufficiently powerful wind driving over them from any direction would fill the sky with a fog of snow without any organization whatsoever; and this, indeed, is pretty nearly the effect produced by all the winds, excepting those from the north. And the cause of the peculiar action of the north wind is found in the peculiar conformation of all the main summit peaks in which the glacier wombs are laid. In general the north sides are concave, the south sides are convex or irregular; and this difference in form between the two sides was almost wholly produced by the difference in the kind and quantity of glaciation to which they were subjected. The north sides were scooped out by residual shadow glaciers of a form that never existed upon the sun-beaten sides.

It appears, therefore, without discussing the question *in extenso*, that *because the shadows of the Alps stretch northward, the residual glaciers stretched northward; and because the residual glaciers stretched northward, the snow banners stretch southward.*

THE WRECK OF THE FISHING BOAT.

PART I.

CAPE PORPOISE is a little fishing town:

Where the tide billow, which the Atlantic rolls
Foaming on reef and beach, glides rippling down
Through sinuous creeks and over shining shoals,
Floating a few light craft, upon the brown

Impassive ooze careened with slanting poles,
Or, reflux, leaves all slack and bare again.
It nestles on the rocky coast of Maine.

In their unchanging, ancient village hived—

Few drones in that compact community—
The hardy fisher-folk have wived and thrived,

Drawing a scant subsistence from the sea
Through many generations; and survived

Tempest and wreck, and dire calamity
Of war—French, English, Indian—and embargo,
And British cruisers catching crew and cargo.

Few drones, I said: there will be, now and then,

Some good-for-nothing idlers found amid
The best communities of bees and men;

Nor could Cape Porpoise ever quite get rid
Of such unthrifty fellows as Wild Ben—

A youth of shining talents, which he hid
In Scriptural earth of self-indulgent sloth—
Under a punch-bowl or a tavern cloth.

A natural boatman—nimble with the sail,

The oar, the seine; no lad more skilled than he
To calk a leak, splice rope, or brave the gale:

A very imp he seemed of the wild sea.
Handy to help, yet never within hail

When needed most; but he was sure to be
Off with his cronies somewhere, getting drunk
Over in Biddeford or Kennebunk.

Ben's father was a fisherman—Job Nelson.

He set the scape-grace to repair, one day,
The foremast step—or socket on the keelson—
Of their small craft, the *Lark*, moored in the bay.
“Do it right now,” he said, “and do it well, son,
Or the next blow will bear it quite away.
’Tis wrenched and parted; and I’m in no hurry
To risk dismasting in another flurry.

“I’ll put that catch of cod-fish on the flakes;
Then you must help me underrun the trawl.”
Ben from the shelf the saw and hatchet takes,
When round the cove he hears a comrade call;
To go with whom his task he soon forsakes,
Careless who mends the boat or helps to haul
The lines that night. Hatchet and saw are left
Upon the shore, hid in a rocky cleft.

The fish were put upon the flakes to dry;
Then Job, all ready for the voyage, looked round,
And searched the little sea-port low and high,
And called; but Ben was nowhere to be found.
’Twas only the wild loon that laughed reply,
Over by Redin’s Island—dreary sound!
That far, half-human call which sometimes mocks
The seeker for some lost one ’mid the rocks.

Ben’s father stormed, and gave him up at last,
But would not leave the trawl another day.
The afternoon and tide were going fast;
The *Lark* would soon be stranded where she lay.
“I wonder did the rogue secure the mast?
Whether he did or not, I can not stay;
I’ll take the tools and mend the step myself,
If need be.” But the tools had left the shelf.

Job Nelson raved, and on the absent one
Volleys of violent invective poured.
But goodwife Jane, who loved her wayward son,
Stood pale and quiet while her husband roared;
Then mildly said, “I’m sure he must have done
The task you bid, and left the tools aboard.
So say no more. I always like to go
And help you with the trawl, and that you know.”

The young ones were just coming in from school—
A girl of six, two boys of eight and ten;
A babe there was beside—as seemed the rule
In every house—of that sweet season when
Babes first begin to push a chair or stool:
A little brood much younger than wild Ben.
(Three others in the rocky hills were laid,
Where you would think a grave could scarce be made.)

The mother soon their simple supper spread,
And nursed her babe, and hastened to prepare
For sea, with more of pleasure than of dread,
And gave the infant to the others’ care,
And left them with their bowls of milk and bread,
And started; but went back and kissed them where,
Grouped in the open cottage door, they stood
To see her off, and charged them to be good.

Again, and still again—she knew not why;
But as she quickly turned to go, there gushed
A sudden tender torrent to her eye;
And over her a fearful feeling rushed,
As if some great calamity were nigh,
And that dear babe might nevermore be hushed
And comforted on her warm breast at night;
But soon she laughed such fancies out of sight.

“You’ll see us coming with the tide at dark,”
She promised them, and hurried to the pier,
Where Job already had his little bark;
And down the steep wharf ladder to the sheer
Groped with slow feet, and stepped aboard the *Lark*;
Then listened, as they pushed away, to hear
The happy children shouting from the door,
And watched until her home was seen no more.

The breeze was fair, the passage smooth and swift;
And huddled in the doorway, side by side,
The children saw the little vessel drift
Among the islands scattered far and wide,
Where broke the sea through many a foaming rift—
A feather wafted by the wind and tide
Away, away, to veer at last from sight
Round Folly Island, by Goat Island Light.

The children ate their meal of milk and bread,
And played at wreck and raft with bowl and
spoon;
And Job, the oldest, put the babe to bed;
Then, as the slow, full-freighted afternoon
Went down the west with wake all fiery red,
And over isle and inlet sailed the moon,
They waited for their parents, anxious-eyed,
To see them coming with the coming tide.

“WILD BEN.”

Pulse of the world! hoarse sea with heaving breath,
Swaying some grief’s great burden to and fro!
Fierce heart that neither hears nor answereth,
Sounding its own eternal wail of woe!
Punctual as day, unheeding life or death,
Wasting the ribs of earth with ceaseless throe;
Remorseless, strong, resistless, resting never,
The tides come in, the tides come in forever!

The tide came in, and flooded creek and cove,
And spread on marsh and meadow far away
Under the moon; and many a dim sail hove
Softly in sight, and gleamed along the bay,
And folded its pale wing, no more to rove;
And hearths were bright, and blithe from breeze and
spray
And chasing breakers, fathers, sons, and brothers
Went home to happy children, wives, and mothers.

The tide came in, and shoulder-deep the pier
Wallowed in waves that lapped and leaped and
glistened;
And still, to see one longed-for sail appear,
The lonesome little watchers gazed and listened
Until their fluttering hearts were filled with fear,
And beat against the bars like birds imprisoned.

"AND STILL THEIR LONG AND LONESOME VIGIL KEEP."

Their parents came not with the coming tide;
And now the hungry babe awoke and cried.

The others cried for sympathy or fright,
Till little Job assumed a manly air,
And brushed his tears, and said, "The moon is bright;
We'll hurry to the wharf to meet them there;
I'm sure by that time they will be in sight.
I'll carry Baby; Willie, you'll take care
That Sissy doesn't fall. Of course, you know,
It's the big catch of fish that keeps them so."

He soothed the babe, and tied his sister's hood,
And led them forth with childish words of cheer:
"Don't cry! you know she told us to be good!"
Then to the wharf, shuddering with cold and fear.
The tide was in; the steep wharf ladder stood
Plunged in the deep wide flood, which lashed the
pier,
And brimmed the bay, and gleamed among the isles,
And silvered shores and shoals for glittering miles.

But over all that bright expanse no sail.
The wind had freshened, and was blowing strong;
And well those little ones might quake and quail,
Harking to catch their father's cheery song,
To hear the waves instead, and rising gale:
No sound beside, but evermore the long
Roll of the thundering breakers far away.
The night was chill; it was the month of May.

They find a skiff careened upon the pier,
And into this the trembling wretches creep,
And cuddle close, eager for warmth and cheer,
And still their long and lonesome vigil keep,
Scanning the troubled waters far and near,
Till all but Job have cried themselves to sleep.
He wraps his shivering sister in his coat,
Then falls asleep himself, there in the boat.

PART II.

And now, half sobered from his late carouse,
Wild Ben went slowly sauntering up the street.
Thinking of home and wrath with sullen brows,
He sidled to the door with stealthy feet,
But stared amazed to find an empty house—
A lamp still burning in the window-seat,
Which Job had set, upon the seaward side,
To cheer his parents coming with the tide.

Ben glowered and growled, and searched both house
and shed,
Then stood and studied, in a sort of maze,
The vacant cradle and each empty bed.
The lamp flame, flickering to a dying blaze,
Leaped, quivered, vanished, and the moon instead
Poured through the quiet panes its haunting rays,
While in his flesh and stirring hair the youth
Felt a cold, curdling horror of the truth.

He from the cupboard brought a loaf and bowl,
And tried to eat; and cursed and swore a little,
To still the rising terrors of his soul;
But strove in vain to solve the fearful riddle.
Then like some conscious murderer, he stole,
From the deserted house. It was the middle
Of the dread night: the village slept; afar
The savage ocean roared on reef and bar.

The smacks, sails furled, and headed all one way,
Veered on the tide in the strong wind which drove
Now tempest-like athwart the little bay:

Only the *Lark* was absent from the cove,
And, tethered to the buoy where late she lay,
The dory reared and champed, as if it strove,
Frighted, to fly. Ben seemed to see and hear
In every object sight or sound of fear.

Then all his faults, the counsels he had spurned,
Thronged on his heart, like fiends, to chide and
mock.

The one bright eye of the lone light-house burned
Far off. What does it see on wave or rock,
Or in the burying surf? The tide has turned;
Back to their caves the wild, fleet waters flock,
White in the moon: to any craft outside,
Struggling for port, a fierce and tyrannous tide.

In his strange horror and bewildering fear
He seeks the landing, and discovers there,
In the old boat abandoned on the pier,
A living heap—Job's face, with tangled hair,
And in the moonlight on that face a tear;
He notes, beside, Job's little arms, half bare,
And, closely nestled, covered by his coat,
The others, all asleep there in the boat.

He saw the small breasts heave; he felt them breathe;
A shadow in the moonlight, dark and dumb,
He watched them for a moment from beneath
Remorseful brows, while every sense seemed numb
With inward agony; then gnashed his teeth.
Job staggered up—"Oh, father, have you come?"
But no kind father's eyes looked down on him;
Only his brother stood there, pale and grim.

"What are you doing, here so late at night?
Where's mother?" "Why, she went instead of
you.

Oh, Ben, I hope you did the mending right!
The tools were gone, and what could father do?"
Ben gave a groan; recoiling with affright,
The little boatman wakes his little crew;
And Ben, arousing from his stupor, tries
To quiet them with well-intended lies.

He launched a skiff, and, cursing smack and trawl,
Leaped in, and sent the trembling wretches home,
And rowed till on the outmost island wall
He saw the gathering surges burst and comb,
Loud-booming, and the angered sea was all
One awful waste of tumbling waves and foam:
No sail, nor any lonesome thing afloat,
Save him, in his own tide-borne, tossing boat.

Stoutly he pulled, and strained his eyes across
The running surf and restless rolling sea,
By Vaughan's low isle and lonely Albatross;
But only rock and ocean can he see.
Tumultuously the hoary waters toss
Their mighty plumes, careering endlessly;
And the beaked breakers with loud rustling wings
Flap on the reef like wild, infuriate things.

Ah, many a time as to a mad carouse
Had he rowed forth, to feel the rush, the thrill,
The towering surge come tumbling on his bows;
The boat, held firm by its bold rider's will—
The mind's electric presence, which endows
Even wood with life and senseless things with skill—
Rising triumphant, flinging off the wave;
Man the sole master, even the sea his slave!

But now there is a fury in his brain:
The frolic purpose and the joy are gone,
And but the practiced power and will remain.
Brows drenched with spray and sweat, wild-eyed
and wan,

He mounts the surges, resolute to gain
The open sea, and to the trawl pulls on;
Finds the long line of tossing floats still there,
But living object never any where.

But what is this the slow great seas uplift,
Weltering, low-sunken, glimmering in the dim
Sad rays of the drooping moon? A wreck adrift,
With heaving, wave-washed side turned up at him,
And through the gaping ribs a ghastly rift:
Some foundered boat capsized. His senses swim;
Madly he gazes round; on every side
Rolls billowy desolation wild and wide.

PART III.

'Twas now some hours since Job his lines had hauled,
Secured the captured fish, and dropped once more
His freshly baited hooks; while Jane, installed
As mate to her brave captain, prompt with oar,
Boat-hook, or bait to help him, scarce recalled
The doubts that shook her at the cottage door.
The hold well stored, the hatchway closed, the sails
Fill, strain, swell proudly, and the rushing rails

Sweep through the water, bowing to the bubbles,
Upon the cheery homeward tack at last.
The lucky fisherman forgets his troubles,
And hopefully he eyes the swaying mast
And sun-lit canvas, as the *Lark* redoubles
Her winged speed in the increasing blast;
And the glad mother turns across the foam
Her yearning gaze with tender thoughts of home.

Then, in the midst of pleasant talk, they feel
A sudden shock, a lurch, and hear a crash.
The staggering foremast, parted from the keel,
Drops slantwise down, and tears a hideous gash
In the *Lark's* side, through which the waters steal,
Rising about their feet with ominous splash,
As, pitching heavily, she lies, brought to,
And sinking, spite of all that Job can do.

And so the worst—far worse than aught he feared—
Had come to pass. Too terrified to speak,
Jane bailed the gushing water, while he cleared
The hatch, and strove to stanch the dreadful leak.
Still, as the cruel ice-cold waters neared
Her knees, her waist, she did not start nor shriek,
But bailed amidst the fish that swam about,
Till a great wave washed in, and they swam out.

She saw the escaping fish as in a dream,
And frantically still the bucket plied.
But now the vessel, settling on her beam,
Turned to the sky her glistening, splintered side:
This too she noticed; and in that supreme
Dread moment thought of many things beside—
Her home, her babes, three little hill-side graves,
And her and Job there struggling in the waves.

Fast to the wreck they cling; but every sea
Deluges them with waters deadly cold.
They sink, they rise, they gaze despairingly
Round the wide waste of waters to behold
Some sail; but only far-off sails they see,
Faintly suffused with pale ethereal gold.
Across the fluctuating gilded swells,
The sun is setting over York and Wells.

"Job, are we lost?" said Jane. "Cling for your
life!"

He cried; "I'll save you." Round the sunken deck
He swam, and cut the halyards with his knife,
And, working in the water to his neck,
Lashed spar to spar; then caught his sinking wife
Just as a great wave swept her from the wreck,
And drew her forth, half drowned, with streaming hair,
Upon his little raft, and lashed her there—

"AND SO THE DAY WENT DOWN UPON THE DEEP."

On the drenched canvas stretched, a dripping heap.
And still the sails descried were few and far.
And so the day went down upon the deep,
And the moon shimmered, and the light-house star
Penciled its ruddy beam across the sweep
Of wandering waters; while, with breast to spar,
Shaping his course to reach the nearest shore,
Job swam, and pushed his laden raft before.

"Oh, Job," said Jane, "I am so cold! I ache
In every bone. Dear Job, if I should die,
Be gentle with the children for my sake.
Oh, now I think, I wish to live, that I
May do my duty better. If you take
Another wife, I hope that she will try
To love our dear ones, and be kind to you.
Forgive poor Ben for what he failed to do."

"Don't talk of dying and of other wives
Quite yet," cries Job; "I'll get you safe to land."
But terribly and strongly as he strives,
Not all the might of manhood can withstand
The wrenching seas and sharp cross-wind that drives
The raft away toward some more distant strand.

Still, for a while he bravely struggles, loath
To quit the raft, which will not bear them both.

Off the dim cape of moon-lit Arundel
Slowly they drift, scarce fifty rods away,
Soon to be swept by wind and drenching swell
Helplessly on, across an open bay,
As Job, in fierce despair, foresees too well.

"Oh, Jane," he says, "there is no other way,
But I must leave you. I will swim ashore
For help. God help us!" He could say no more.

"I thought of that. If you are sure to reach
The rock and save yourself, I pray you, go.
But, oh," she said, "for *their* sake, I beseech,
Take care. The sea is terrible, you know,
On these sharp ledges." "There's a pebbly beach
Close in the point. I'll rest a minute. Oh,
Now must I leave you?" "Touch me first," said Jane,
"Dear Job, for we may never meet again."

So they touched hands upon the cold wet mast
With quick, convulsive pressure, and with wan,
Strange faces in the moonlight looked their last,
And said their last farewells—and Job was gone:

Forth from her side a slow dark object passed,
Tossed by the sweeping waves; and, drifting on,
She watched him from her raft, and held her breath,
And prayed, "O, save him, save him, Lord, from
death!"

She watched him sink, and mount, and disappear;
Then strained each aching sense to see him gain
The gray grim shore, his signal shout to hear,
Forgetting her own peril and sharp pain;
Broke from her bonds, half rising from her bier,
And gazed and shrieked and wrung her hands in vain,

She nears the spindle of the Fishing Rocks,
Where rise the boisterous deeps in dire turmoil,
And shake toward heaven their loosened silvery locks;
And now the reef-rent billows froth and boil
Around the rocking raft with violent shocks,
Thundering in endless onset and recoil.
Then dies the roar behind her, slowly dwindle
Foam-circled ledge and lonely moon-lit spindle.

Dying she seems; and, like one dying, sums
Her good and evil days in manifold
Visions of home and love; till life becomes

"MOTHER!—O GOD! YOU ARE NOT DEAD!"

In unimaginable wild distress—
Alone in the vast ocean's loneliness.

No answering shout, no dim emerging shape—
Or they are lost in the perpetual roar
Of waters and the formless glooms that drape
The solitary coast. And evermore
The raft is slowly drifting from the cape;
And still no dory from the inner shore
And long dark river pier, nor boatman's cry,
Brings hope that *he* is safe and help is nigh.

A dream of misery and mortal cold,
And mercifully pain itself benumbs
The sense of pain. And so the night grows old;
And, like a shuttle of the wind, which shifts
Sharply about, back toward the cape she drifts.

PART IV.

The night grows old, the moon is low, the stars
Drowse in the liquid depths of heaven. And now,
With hope reawakened by the missing spars,
Ben searches sea and shore, and drives his bow

Amidst the breakers of the rocks and bars,
 Darting with desperate speed his daring prow
 At any shape or shadow, which may be
 Shadow or shape he longs yet dreads to see.

He rounds the cape, from cove to cove he rows,
 And, as the moon is setting, comes at last
 To Old Fort Beach, which, half in shadow, shows
 A long low shape upon the shingle cast.
 Through tumbling kelp, rolled in the under-tow's
 Enormous foaming jaws that hold it fast,
 He shoots his skiff ashore, and stoops beside
 That long low shape left stranded by the tide:

A mass of spars and twisted ropes, still wet
 From the receding wave; with flecks of spume on
 The dark, drenched sail, and something darker yet—
 A shadow in the shadow, ghastly, human,
 Stretched on the raft. Mother and son met.
 Cold to the touch, appalling, droops the woman.
 He lifts her from the raft, and kneeling there,
 Bends over her in terror and despair.

"Mother!—O God! you are not dead!" He takes
 A rum flask from his coat in furious haste,
 And for the first time in his wild youth makes
 Wise use of its bad contents. At the taste
 She gives a little moan of pain, and wakes
 Slowly to consciousness of strong arms placed
 Around her, and a shadowy visage bowed
 Above her in a sort of dreamy cloud.

And for the first time in his life he prays
 To Heaven, to her, with mingled oaths, as if
 Profanity and prayer were kin. He lays
 Full half his garments on her in the skiff,
 And pushes off in the moon's faint last rays;
 And rows away by sombre cove and cliff,
 And on through flashing surge and shadowy air,
 Under the light-house lantern's streaming glare.

Meanwhile the little ones lie sunk in deep
 And restful slumber, till, with direful din,
 Which fills the house and wakes them from their sleep,
 A sudden headlong force comes bursting in.
 Staring with fear, upright the youngsters leap,
 And see what seems their brother Benjamin
 Bearing a great black burden on his arm
 In the gray dawn, and shouting loud alarm.

"Quick! for the doctor, for the neighbors, run!
 Mother is drowned!" Half naked, from the shed,
 With sobs of terror, speeds the oldest one.
 The others, wondering, whispering, "Is she dead?"
 Clasp their small hands, while the remorseful son
 Is getting her into their soft warm bed.

Too weak for words, she gives a pitying sigh
 And faint sweet smile, to hear her baby cry.

She had not thought that ever she should hear
 That cry again. And now she seems half blessed:
 Ben is so good, her little home so dear!
 Now, if she dies, she feels that this is best—
 To fold her palms with friends and kindred near,
 In her dear home, and then be laid to rest
 By gentle hands beside those little graves,
 And not to perish in the cold dark waves.

If only Job were safe! That thought again,
 With throbbing life's return, distracts her mind.
 The neighbors now come hurrying, earnest men
 And white-faced, eager women, all so kind.
 Some stay to serve the sick, and some, with Ben,
 Put forth in boats and scour the coast to find
 The missing man; while springs triumphantly
 The glorious sun from out the glorious sea.

Its far-off flag of smoke a steam-ship trails
 Across the fiery orb; and here and there,
 On the blue dome of ocean, tacking sails
 Darken and brighten in the purple air.
 Forgetting death and wreck and ruthless gales,
 The broad bright sea is marvelously fair!
 With quivering scales and panting side, lies curled
 The azure dragon round about the world.

Such beauty seems a mockery of their quest.
 The frolic waters well their secret keep,
 And hide grim death beneath a lovely breast.
 Down in the green recesses of the deep,
 Where, to and fro, in noiseless dark unrest,
 The slow mysterious plumes of sea-weed sweep,
 With upturned face and sightless, staring eyes,
 Beckoning with spectral hand, the dead man lies.

Five days they search in vain; upon the last,
 A farmer gathering sea-weed hears a yelp
 Of terror from his cur, and starts aghast
 At something hideous tangled in the kelp.
 Ox-goad and fork down on the beach are cast;
 And from the nearest farm runs ready help.
 'Tis done: the slow, unwieldy oxen start,
 With a dread burden oozing in the cart.

Beside the little graves is shaped another;
 Then the sad burial. Her own life scarce won
 From death, at home still lay the weak, wan mother;
 But with the children walked the oldest son,
 His hat plucked fiercely on his brow—their brother
 From that time forth, and father, both in one—
 Rage in his heart, and on his bowed soul set
 The thorny crown of sorrow, vain regret.

THE MOHAWK VALLEY DURING THE REVOLUTION.

IT may be safely asserted that in no section of the northern colonies were the loyalists so numerous or so influential, when the first mutterings of discontent were heard from rebellious Boston, as along the valley of the Mohawk. Many conditions conspired to make the cause of the crown popular and powerful there that were lacking to the more ancient settlements; prominent among them, the almost absolute power that Sir William Johnson had obtained over the hith-

his character, which, from its bluff, unassuming sociability and hearty generosity, was well calculated to inspire the attachment of an unlettered population, had also given to his opinions the force of legal authority among the white inhabitants of the valley. Their faithful, unwearied friend in peace, and their leader in war, his name was a tower of strength throughout Tryon County; and it was very natural that his opinions upon such a momentous question

THE SITE OF OLD FORT SCHUYLER.

erto hostile Iroquois and white settlers alike. He was the only white man who had any extended influence over the surrounding savages, who, without him, had been the cruel and relentless foe of the young communities, and his noble qualities and gracious deeds had completely won the hearts of the settlers.

By the Indians, not only of the Six Nations, but of further western tribes, he was regarded with the greatest veneration. Long association with him, and great respect for

as this should have great weight with them in forming their own.

But, unfortunately for the crown, whose interests, in common with those of his neighbors, he had upheld with such signal success, his services were abruptly terminated at the time when, most of all, they were needed. He died suddenly at Johnson Hall, Johnstown, June 24, 1774.

Neither his son, Sir John Johnson, his successor in title and estates, nor his son-in-law,

Guy Johnson, who succeeded to his office of Superintendent of Indian Affairs, possessed the same degree of moral power over the population of Tryon County, Indian or white, as had the late baronet. Sir John was far less popular, being morose and irascible in disposition, and with little knowledge of human nature. The new superintendent, also, was a man of small mental calibre and violent passions; and it was not long before the far-reaching influence that Sir William had wielded over the minds of the colonists was narrowed down by the incapacity of his successors to a sort of feudal domination over a few hundred tenants and immediate retainers.

By the aid of "Miss Molly," a Mohawk woman who had lived many years with the old baronet in an equivocal relation, and the strenuous exertions of her brother, Thayendanegea, better known to fame as Joseph Brant, they still maintained the ascendancy over the Indians that Sir William had exercised, though in a diminished degree. But the white settlers of the valley, consisting for the most part of Dutchmen who had pushed up the beautiful valley from Albany as far as Caughnawaga, and west of that point of Germans who had emigrated from the Palatinate in 1709, and settled upon the rich alluvial bottom-lands, known as the German Flats some ten years later, were ill disposed to submit to the haughty bearing of these new-fledged English aristocrats, who, with other country gentlemen of the same pattern, assumed a high and mighty style of dealing with the poorer colonists; and when the openly avowed sentiments of the rebellious New Englanders found their way across the Hudson and up the Mohawk, they met with hearty approval from these sturdy borderers, now thoroughly disgusted with any thing English.

The news of the massacre, as it was then termed, at Concord and Lexington, which spread through the colonies like wild-fire, threw the yeomanry of the valley into a fever of excitement. The Dutch nature, proverbially slow to anger, was stirred by this intelligence, and the injudicious reception of it by the Tory element at Johnstown, into an angry activity and impetuosity that no power could subdue. Meetings were called,

SIR WILLIAM JOHNSON.

inflammatory speeches made, and committees of safety appointed in every hamlet throughout the settlements. One of these gatherings, held at Caughnawaga, was broken up by the Johnsons and a party of loyalists with some violence and considerable brawling; and immediately after, Sir John fortified Johnson Hall, and organized a body of Scotch Highlanders, to the number of one hundred and fifty, whom he armed to the teeth, with the intention of suppressing any further exhibitions of disaffection.

In the mean time the Provincial authorities became suspicious that Colonel Guy Johnson was using his official authority with the Indians to alienate them from the cause of their white neighbors, and to induce them to declare themselves unreservedly for the King. He had in January removed the Rev. Samuel Kirkland, a missionary among the Oneidas, who was a staunch patriot, and to whose influence is to be attributed the position taken by the Oneidas during the struggle, and the signal aid which they gave to the Provincial cause; and now positive proof came to the Albany committee's hands that he was inciting the Mohawks to violence. Apprehending some offensive action upon their part, Colonel Johnson left the valley quietly in June, and hastened to Ontario, accompanied by Brant and the two Butlers. Here a grand council was held with the western Indians, with flattering results; and after a few days' parleying with them, he started for Montreal, accompanied by an imposing delegation of sachems and warriors, which latter were upon their arrival persuaded to go into the service of King George.

The Whigs, who were now in a decided majority, had, during this time, been far from inactive. Their committees organized the people into militia, and took upon themselves the civil and military jurisdiction of Tryon County. They deposed the sheriff, a staunch and overbearing Tory, by name Alexander White, and appointed an equally ardent Whig in his place, Colonel John Frey. This White, intent upon showing his contempt for the Provincials, had arrested a rather boisterous patriot, by the name of Jacob Fonda, upon some trifling pretext,

and locked him up in the jail at Johnstown. The same night a mob of infuriated Whigs, under lead of Sampson Sammons, broke into the jail and released him; then, excited by their success, they trooped off to the sheriff's lodgings, to the number of fifty, and, noisily enough, demanded his surrender. White opened a second story window, and probably recognizing the leader of the expedition, called out, "Is that you, Sammons?"

"Yes," was the prompt reply, upon which White sent a pistol-ball whizzing uncom-

description could hope to the state of feeling existing in the valley settlements.

Early in the following year (1776) General Schuyler, then in command of the New York Department, being dissatisfied with the equivocal position of Sir John, who was living in a fortified castle, surrounded by 500 retainers, in much the style of a mediæval English baron, determined to probe his intentions to the bottom, and to that purpose marched upon Johnstown at the head of 3000 men. After some little diplomatic

NIGHT ATTACK ON THE TORY SHERIFF.

fortably near his head. This shot, the first one fired in the war of the Revolution west of the Hudson, was instantly returned by a rattling fire from forty or fifty muskets; but the sheriff escaped with a slight scratch on the breast. The doors were kicked in, but before the assailants could find White, the report of the cannon at the Hall was heard; and as it was a signal for the Highlanders to rally, the Whigs thought better of it, and retired. White was soon after sent a prisoner to Albany. This little incident is related as showing better than any lengthy

sparring and considerable lying on the baronet's part, the general compelled Sir John to surrender all the arms, ammunition, and military stores in his possession, and to disband his Highlanders. All the prominent Tories of the neighborhood were arrested, and having broken down all symptoms of rebellion to his complete satisfaction, Schuyler left Colonel Herkimer to look after the vanquished baronet, and returned to Albany.

But even this energetic measure did not suppress the spirit of disloyalty, or, as he called it, loyalty, that possessed Sir John.

He immediately began to employ moral suasion, since he was powerless to use other means; and soon General Schuyler found that he was, in violation of his parole, secretly instigating the neighboring Indians to hostilities, and was thus likely to work infinite mischief along the frontier. Determining upon vigorous measures at once, Schuyler immediately dispatched Colonel Dayton with a detachment to capture the troublesome baronet, and thus end the matter. But loyalist friends in Albany sent warning without delay; and as Colonel Dayton arrived at the easterly edge of the village, Sir John, with a large body of tenants and retainers, struck into the great northern forest, and fled for his life. Being miserably equipped and provisioned, they suffered terribly, and reached Montreal, after nineteen days of incredible hardships, in a most pitiable condition. Sir John's vast estate—with a single exception the largest ever owned by any one man in the colonies—together with the personal property which he left behind in his flight, were confiscated by the Provincial authorities, and subsequently sold at auction. Lady Johnson was removed to Albany as a hostage for the peaceful conduct of her husband.

Upon his arrival at Montreal, Sir John Johnson was commissioned a colonel in the British service, and raised a command of two battalions, recruited for the most part from those who had accompanied him in his flight or subsequently followed his example, which, under the name of the Royal Greens, did most bloody service in the very valley they once delighted to call their home.

After the baronet's flight the few remaining loyalists made no actual demonstrations; and though the Whigs by no means relaxed their vigilance, or forgot that they lived on a frontier that was at all times liable to sudden incursions from the savages, the valley for a time enjoyed something of its old-time quiet and peace. Soon, however, after the fugitive Tories had reached Montreal, rumors came down from Oswego, through the medium of traders and friendly Oneidas, that Sir John Johnson—than whom the Provincial cause had no more fierce and vindictive foe in the enemy's ranks—with his associates, Brant and

the Butlers, was contemplating an invasion of the valley at the head of a host of Indians and Tories, and that they had sworn to sweep through the valley like avenging demons, exterminating the settlements.

So strong became the impression that the little cluster of communities, which lay, totally defenseless, almost within the grasp of the hostile savages, had not seen the last of these vengeance-vowing Tories, that Congress directed General Schuyler to strengthen the defenses of the exposed valley with all possible speed. Accordingly, Colonel Dayton was sent up to Fort Stanwix, with orders to push forward the work of rebuilding that antiquated fortress with the utmost energy, as in case of an invasion it would be a most harassing obstacle to the enemy's progress.

This fort had been built early in the year 1758, during what is commonly known as the "old French war," by the English General Stanwix, and commanded the famous "great carrying place." The importance of its situation will be readily seen when it is remembered that the Mohawk was at that time the great western thoroughfare to the lake settlements and the Canadas. All the goods to be transported west from Albany were hauled in wagons as far as Schenectady; at this point loaded upon bateaux, and poled up the river to where Rome now stands—the site of Fort Stanwix. Here

the German settlers carried them across the country to Wood Creek, distant a little over a mile, where boats again transported them, by the way of Oneida Lake and Oswego River, to the great lakes. A curious old document, addressed to the Lieutenant-Governor of New York, bearing date of June 1, 1754, will serve to illustrate the difficulties under which commercial enterprise labored in those primitive times:

"We, the Traders (or Handlers) to Oswego, most humbly beg leave to remonstrate to your

Honour, the many hazzards and Difficulties We are Subject to in our passage thither from the ill treatment we meet with from the Indians (i e) in passing the Mohawks and Canajohary Castles, they Board our Battoes with Axes knives &c and by force take what Rum they think proper hooping and yelping as if they had Gloried in their depra-dations and threatening Murder to

COLONEL PETER GANSEVOORT.

any that oppose them: And on our Arrival at the great carrying place The Oneida Indians force our Goods from us at pleasure to carry over, and not content with making us pay a most exorbitant price for each Freight but rob us of our Rum, Stores and other Goods with a great deal of invective threatening language, and are generally so Numerous that we are Obligated to Submit to those impositions or run the risk of being Murdered and Robbed of everything we have; And to put their Schemes the better in Execution they force away the High Germans who generally attend with their Horses, that we may be under a Necessity of employing them and paying whatever they please to demand....."

From which it may be inferred that the licensed barbarians who, by their importunate cries and clutchings, transform our otherwise peaceful journeyings into fierce struggles for liberty at every station, are not, after all, a product of this enlightened age, but are only following in the footsteps of those unlettered, unlicensed porters of the forest.

Notwithstanding the labors of Colonel Dayton upon the dilapidated works, Colonel Peter Gansevoort, of the State line, when he assumed command of the fort in April, 1777, found it not only indefensible; but absolutely untenable; the only improvement accomplished by Dayton being a change in its name to Fort Schuyler. But Gansevoort set to work with a brave heart to better, if possible, his condition; and being soon after joined by Colonel Marinus Willett and his regiment, succeeded—hampered as he was by sickness, bad roads, lack of food, and a wofully incompetent engineer—in so renovating and strengthening the ruinously dilapidated old fortress as to be able to hold it, a few months later, defiantly and successfully through the progress of a long and rigorous siege.

During the summer of 1777 Colonel Barry St. Leger, contemporaneously with the descent of Burgoyne upon Northern New York, sailed from Montreal to Oswego, where he formed a junction with the Tories and Indians who, under the lead of Sir John Johnson and Joseph Brant (now a captain in the British army), had congregated in the vicinity of that place to the number of 1300 fighting men. From Oswego he started, at the head of a force of 1700 men, for the Mohawk Valley, by the water route, with the inten-

tion of crushing the rebellious element there, and thence marching down to meet Burgoyne at Albany.

This plan had been carefully prepared in London, and upon its successful issue the ultimate success of the British cause depended

JOSEPH BRANT.

in a very great degree. It was reserved for a few hardy, resolute farmers to circumvent this design, and to turn into a disastrous defeat what had been regarded by its sage authors as a most masterly movement, destined to meet with eminent and gratifying success.

The leaders to whom was intrusted the conduct of this expedition certainly did every thing within their power to bring it to its destination triumphant. St. Leger, the commander, was an officer of marked ability, enjoying a good reputation. Brant, who had charge of the savage allies, and whose counsels appear unmistakably in both the formation and attempted execution of the project, was beyond a doubt the ablest general and strategist that the Six Nations ever produced; the order of the invading host's march through the almost primeval wilderness shows not only the exercise of extraor-

dinary care and precaution, but a thorough and profound knowledge of the country and the peculiar character of the enemy they were about to attack.

On the morning of August 2, Lieutenant-Colonel Mellon, also of the State troops, arrived at Fort Schuyler with two bateaux of provisions and ammunition, guarded by a detachment of two hundred men. Both the soldiers and their addition to the fort's scanty stock of stores were heartily welcomed. The boats were unloaded, and their contents hastily conveyed to the fort; delay, indeed, would have been dangerous, for at the instant the last load reached the door of the stockade, the van of the approaching army broke through the edge of the forest, and so near to the bateaux that the captain in charge of them was taken prisoner. The following day witnessed the arrival of Colonel St. Leger with the remainder of his forces; and after a pompous summons to surrender, which was indignantly rejected, Fort Schuyler, short of ammunition, with 750 men and six weeks' provisions, was formally invested.

The intelligence of St. Leger's advance spread rapidly down the valley, and created every where among the Whigs the utmost consternation and excitement, supplemented almost instantly by a general resolve to protect to the uttermost their homes and families from the horrible results of an Indian conquest. Many remembered the sickening butcheries that followed the conquering French armies in the previous war—carnivals of blood and rapine which the French at least tolerated in their savage allies, and the records of which still make men shudder in horror and disgust. A repetition of these scenes the militia of the county determined, even with their lives, to prevent. Something akin to desperation was to be found in the eager response that met General Herkimer's prompt summons upon the militia of Tryon County. All doubts, fears, and sluggish apathies were forgotten at the approach of the invader.

On the morning of the 4th nearly a thou-

sand men had assembled about Fort Dayton, a little stockade fort built the year before by Colonel Dayton upon a slight eminence some hundred and fifty yards from the site of the present court-house at Herkimer, and which had been selected by Herkimer as a place of rendezvous. Never had a more heterogeneous mass of men been gathered together in the valley of the Mohawk; for the most part sturdy, resolute, square-jawed farmers, clad, some few in uniform, the majority in homespun or leather, with tanned, rough faces, and alert, keen, sparkling eyes, rude in speech and bearing, gathered in little groups, with trusty flint-locks under their arms, and pipes in mouths, conversing excitedly in a jargon of villainous German and worse English. Scattered here and there through these knots of stalwart, burly borderers might be seen figures arrayed in blue and buff, with powdered hair, and thin, clear-cut features, white hands fringed with

whiter ruffles, and, clattering and clanking with each stride as with long straight swords and jingling spurs they flit about, uttering half-whispered words of command. These last are gentlemen of the county, and, as such, of vast importance—in their own minds. On the whole, there is small regard for discipline or authority existing in this motley, eager-talking crowd; to the contrary, magnified conceptions each of his own individual prowess and sagacity. But differ as they might in form of dress, in shape of weapons, in sense of subordination, these thousand settlers possessed in common a savage,

half-fiendish itching for the meeting face to face with their long-dreaded foe, for a glimpse of the whilom Tory neighbor over the sight of their old familiar flint-locks; for these uncouth men, a short time since peaceful, phlegmatic farmers, dwelling content upon the little oases they had wrought out of the wilderness, are now transformed into little else than savages, and are longing with all their souls for the approaching fray.

Words of caution, of sober advice, are not wanted here; are received at first in stolid,

MARINUS WILLETT.

sulky silence, then with loud-rising murmurs of disapprobation, which reach the ears of those in chief command. Within the inclosure of the little fort are gathered around a rude table some dozen officers, bus-

brow; on the contrary, very dark indeed. This impatient growling of his men, heard faintly from without, savors ominously of insubordination, of possible revolt. His officers are young, inexperienced, and full of

"LEAD US ON!"

ily discussing the task that lies before them. Behind them, pacing up and down with steady tread, is an elderly man, also in buff and blue, of tall stature and commanding mien, with cocked hat pulled down tight over his eyes, with lips firmly pressed together, thinking and listening deeply, stopping now and then to settle, with a quiet, decisive word, some vexed question, and again resuming his march, with a look of troubled responsibility upon his brave face that intensifies as the morning wears on, and which all his self-confidence and intrepid courage can not overcome or hide. This is General Nicholas Herkimer, a brave man and true, who for many years has served the cause of humanity faithfully; has for many years been a man of might in the valley settlements; has held innumerable councils with the Indians, and led many expeditions through forest defiles and dismal swamps after them when, in the judgment of the colonies, they stood in need of correction or chastisement; and now has, unwittingly, reached nearly the goal of his earthly labors. Through no pleasant means did the brave, bluff old patriot attain this goal. His way is any thing but clear to him now, as he paces with folded arms and perplexedly thoughtful

self-confidence; are apparently as eager as their men for instantaneous advance. Brave old Herkimer in his perplexity appeals to half-breed Thomas Spencer for support. A blacksmith of the Cayugas, this Spencer was, and for many years a staunch friend of the colonists. He it was that had first brought news of St. Leger's preparations, and he, more than almost any other, would have had influence—by reason of a certain rude, sinewy eloquence, and a reputation for thorough knowledge of Indian warfare—over the minds of the settlers in a calmer moment. But now he is powerless; all his wary words about caution and discipline, warnings of the terrible reputation of Thayendanegea and the strength of the foe, and finally his pleas for at least a scouting party in the van, and some degree of order in marching, are greeted by shouts of derision and loud cries of "Lead us on! lead us on!"

Herkimer, in despair, turns to the cluster of officers, but finds no support from them. One or two of the more elderly do indeed yield a vacillating sort of support, but are speedily silenced by the young colonels, now clamorous for action. Fearing that he may lose all control over this turbulent genie that he has evoked by any further efforts at

restraint, Herkimer gives a reluctant assent to the now almost universal demand. He and such other officers as are fortunate enough to possess horses spring into their saddles; the baggage wagon, covered by weak or lazy patriots, starts rumbling down the rough road; and with cheers of gratification the impatient rank and file shoulder their flint-locks, and in utter disregard for order, discipline, or any thing else save reaching their destination as quickly as possible, swarm around it, and trudge on impetuously.

The old road that led west from Fort Dayton was at best but a rude path through the wilderness, in many places almost impassable; and despite their hot-headed ardor, the advancing force travelled but slowly. They crossed the river at *old* Fort Schuyler (now Utica), and encamped the next day some six miles further on, a little west of the present village of Whitesborough. From this point General Herkimer sent forward an express, consisting of Adam Helmer and two associates, to apprise Colonel Gansevoort of his approach, and to concert measures of co-operation. Their arrival at the fort was to be announced by three successive discharges of cannon. The task assigned this trio was, as may be imagined, none of the easiest, since the intervening forests were filled with hostile Indians intent upon preventing any communication between the settlements and the beleaguered fortress. However, they succeeded in reaching the fort late in the forenoon of the 6th, and the concerted signals were immediately fired. General Herkimer's intention was to cut an entrance through to the fort, and arrangements for a sally were accordingly made by Colonel Gansevoort, with the purpose of diverting the enemy's attention from Herkimer's movements.

Unfortunately the old general had in forming this plan calculated without his host. On the morning of the 6th his men, who had been with difficulty persuaded to remain quiet during the preceding day, broke out into something very like mutiny. They declared that the express had in all probability been captured or murdered, and that the same fate was in store for them if they frittered away their time in idle waiting, while their brothers, fathers, and friends were starving in the fort only eight miles away. Their loud complainings alarmed the commander, and he hastily summoned a council of his more prominent officers, and laid the situation before them, with a view to determining upon some course of action. The officers are unanimous in their desire to press forward.

Among them we may see spruce young Colonels Cox and Paris, standing, slim and straight, glittering in the morning sunlight, not without a sense of their own dignity and local importance, wrathfully impatient

of the grave, sober dictates of their yeoman superior, and smiling contemptuously at his cautious prudence. Colonels Visscher and Klock, and others in authority, we see dimly in the meagre chronicles, grouped about, also with a tendency toward insubordination, or at best with a wavering respect for their commander's judgment. Here, too, is boisterous, burly Sampson Sammons, whose irrepressible love of liberty and brawls had long ago lifted him into notoriety and a quasi-leadership among the more adventurous of the settlers, and who is, we doubt not, heartily sick of all this talking and inaction. Before this council Herkimer gravely lays the situation, urges the impatient leaders to remain where they are until reinforcements can come up, or at least until the signal of a sortie shall be heard from the fort. In his opinion it was folly for a thousand illy equipped militia to attack an intrenched force of twice that number of well-armed troops and notoriously cunning Indians—the flower of the famous Six Nations.

His temperate words only added fuel to the flame. Colonels Cox and Paris angrily retorted that they had come to fight, not to watch others fight, and wound up by denouncing Herkimer to his face as a Tory and a coward. Suppressing his rising indignation, the old patriot replied, with forced calmness, that he considered himself placed over them as a father, and that he did not want to get them into any difficulty from which he would be powerless to extricate them. "You," said he, "who want to fight so badly now, will be the first to run when you smell burnt powder."

Swelling with virtuous wrath at this insinuation, the young officers hotly renewed their reproaches of senile cowardice and want of fidelity to "the cause," which this time met with an echo of approval from those around.

Thoroughly enraged at last, the stout old general, with flushed face and gleaming eye, cried, "March on, then!" In an instant, with a great shout, the troops grasped their arms, the camp was struck, and the little army rushed forward in the utmost confusion.

In the mean time, Colonel St. Leger, apprised by his scouts of the advance of the militia, had, very early on the morning of the 6th, dispatched Brant, with nearly all his Indians and a detachment of Johnson's Greens, with instructions to, if possible, prevent their farther progress, leaving to Brant's discretion the means to be employed.

The van of Herkimer's motley host was descending the steep slope of a ravine, some two miles west of Oriskany, in hot haste and disorder, when suddenly the guards, both front and flanks, were shot down, the forest rang with the sharp crack of musketry and

the blood-curdling yells of concealed savages, and in a twinkling the greater part of the division found itself hemmed in, as it were, by a circle of fire that mowed down the outer ranks like grass before a scythe. Thrown into almost irretrievable confusion by the suddenness of the attack and the flash and whirl of leaden lightning about their heads, dropping like leaves in the forest before the deadly precision of the enemy's aim, floundering, for the most part, knee-deep in the morass that, with the exception of a narrow log causeway in the centre, constituted the bottom of the ravine, and utterly unable to defend themselves from a hidden foe, it seems miraculous that the detachment escaped total annihilation. But all the devilish ingenuity of Joseph Brant—and surely he has left upon record no achievement more worthy of himself—was not a match for the dauntless courage and endurance of the brawny frontiersmen.

A portion of Colonel Visscher's regiment, which formed the rear-guard of the advancing force, was cut off from the main body by the precipitate action of the savages in closing the segment—left open at the road—of their circular ambuscade, and, as Herkimer had predicted, fled ingloriously from the field in headlong haste, led by their erstwhile courageous colonel. History takes a grim satisfaction in recording that they were pursued by Mohawks, and were punished much more severely than would have been the case had they stood by their comrades in distress.

But the environed militia, after the terrible shock of the surprise had passed away, exhibited an amount of bravery and intrepid self-possession that has seldom been equaled in our eventful history of forest fights, and that must go far toward atoning for their previous rash and reprehensible conduct. In this they were furnished a magnificent example by their general. The veteran was wounded in the early part of the action, while endeavoring to rally the scattered wits of his men, by a musket-ball, which, passing through and killing his horse, shattered his leg just below the knee. He was lifted at once from his fallen horse, and placed, at his own request, upon his saddle, propped against a beech-tree half-way up the western slope for support. In this situation he lighted his pipe coolly, and though the bullets were whistling about him, and men falling thick and fast within a few yards of his post, continued to direct the battle, giving his orders as calmly and collectedly as if on a parade ground.

After this butchery had gone on for some three-quarters of an hour, a brilliant idea occurred to Captain Jacob Seeber, which, upon his own responsibility, he instantly put into execution. He formed the remnant

of his company into a circle, the better to repel the attacks of the enemy, now closing in upon their victims. His example was immediately followed by the rest, and from that moment the resistance of the Provincials, hitherto confined to a desultory firing, became more effective. The change of tactics rendered some change necessary on the part of the enemy, and accordingly a detachment of Royal Greens charged upon the little band of patriots; the firing ceased, and as the bayonets clashed, the contest became a fierce death-struggle, hand to hand, foot to foot.

The Greens were for the most part fugitive loyalists from Tryon County, and consequently former neighbors of the militia-men. As no quarrels are so bitter as those of families, so no wars are so cruel and vindictive as those called civil. As they advanced and were recognized, all the resentments, hatreds, and grudges that long years of controversy and mutual injury had engendered burst forth in a perfect whirlwind of fury. The Provincials fired upon them as they drew nearer, and then, springing like infuriated beasts from their covers, attacked them with their bayonets and musket butts; or, each party throwing these aside, rushed at each other in a very delirium of passion, throttling, stabbing, biting, and, in many cases, literally dying in one another's embrace. This savage struggle was mercifully interrupted by a heavy thunder-storm, one of the severest of the season, which raged for over an hour, during which interval each party sheltered themselves as best they could, and studied their chances for success when its violence should abate. The militia-men intrenched themselves upon an advantageous piece of ground, and thus, formed in a circle, awaited a renewal of hostilities.

In the early part of the battle, the Indians, whenever they saw a gun fired from behind a tree by a militia-man, darted out and tomahawked him before he could reload. To put a stop to this harassing mode of warfare, two men were stationed behind a single tree, one only to fire at a time, the other reserving his fire until the confident savages rushed up as before. The fight was speedily renewed, and by these new tactics the Indians, who had been rendered less cautious than usual by a generous allowance of rum, were made to suffer severely, and soon showed signs of wavering.

At this juncture the loyalists put into execution a piece of strategy that nearly proved fatal to the patriots. It was the sending of a detachment of Greens, disguised as Continentals, from the direction of the fort, in the hope that they might be received as a timely re-enforcement from the garrison. This *ruse de guerre* at first deceived Lieutenant Sammons, who ran and told his captain, Gardenier, that a body of men was approach-

ing his company, with American hats, doubtless from the fort.

They continued to advance until hailed by Captain Gardenier, at which moment one of his own soldiers, seeing an old and long-absent acquaintance among them, ran

from his spear leveled the captor and liberated his man. Others of the foe then set upon Gardenier, of whom he slew one and wounded another. Three more of the disguised Tories now sprang upon him, and one of his spurs becoming entangled in

GENERAL HERKIMER DIRECTING THE BATTLE.—[SEE PAGE 179.]

to meet him with outstretched hand. The credulous warrior was instantly dragged into the ranks of the Greens, and informed that he was a prisoner; he, however, did not yield without a struggle, during which Gardenier, who had watched the action and its result, sprang forward, and with a blow

their clothes, he was thrown heavily to the ground. Still struggling with almost superhuman strength, both of his thighs were transixed to the ground by the bayonets of two of his assailants, while another was thrust at his breast. Seizing this with his left hand, by a sudden wrench he brought

its owner down upon himself, where he held him as a shield until one of his own men, Adam Miller, came to his rescue. As the Tories turned fiercely upon this new adversary, Gardenier rose half-way, and grasping a spear with his mangled hand, drove it like lightning into the side of his late *vis-à-vis*, killing him instantly. While this desperate struggle was going on, some of the militia-men called out to Gardenier, "For God's sake, captain, you are killing your own men!" He yelled back, "They are not our men; they are Tories. Fire away!"

Then, as the heroic captain was dragged from the clutches of the infuriated loyalists, a volley of musketry from the Provincials struck down thirty of them and nearly as many Indians. Through the leafy depths of the grand old forest rang again the clashing of steel, the roar of rifles, the hoarse, pitiful moanings of the down-trodden, writhing wounded, and, above all, the hideous yells of the enraged savages.

These last, finding their number sadly diminished, and being dismayed by the stubborn ardor with which the Provincials maintained their defense, now raised the retreating cry of "Oonah!" and fled in every direction, followed by frantic cheers and showers of bullets from the surviving patriots. As they leaped yelping through the woods, swiftly pursued by the unerring rifle-ball, the guns of the fort were heard booming in the distance. Dismayed in their turn by this unwelcome sound, the Tories precipitately followed their Indian allies, leaving the victorious militia in possession of the hard-earned field.

Thus ended one of the most hotly contested and, for the number engaged, the deadliest of the Revolutionary battles. Though victory crowned the desperate valor of the Provincials, it was to them perfectly useless, and was bought at a terrible price. Scarcely a farm-house was there along the valley that had not cause to mourn this bloody triumph, hardly a hamlet that left not the flower of its sinewy manhood to moulder in that dark, dank, blood-drenched morass. Of the thousand men that marched upon the enemy so confidently on that fatal 6th of August, only some third ever saw their homes again. Between three and four hundred lay dead upon the field when the sun went down; nearly as many more were mortally wounded, or carried into a captivity that, in those ruthless days, meant death in its most horrible form.

General Herkimer was carried in a litter to his house, some thirty-five miles down the valley, where, after lingering in pain for about ten days, he died from the effects of an unskillful amputation. Colonel Cox was shot down in the first volley from the ambushed Indians. Colonel Paris, who was a member of the colonial Legislature and a

volunteer officer, was taken prisoner by the Indians, and by them brutally murdered some days later. Major John Frey, whilom sheriff of the county, and a man of great courage and strength withal, was also captured by the savages. To the shame of the race, be it added, his brother, a furious Tory, ran at him when he was brought into the British camp, and was with difficulty prevented from butchering him on the spot.

Although no authentic statement exists, the loss of the enemy is believed to have been even more severe; the Indians, in particular, were roughly handled, having lost over a hundred warriors, among them several eminent sachems. The Provincials removed some fifty of their more slightly wounded comrades; the enemy's fallen were allowed to die of starvation and their wounds in the swamp. An American scout who crossed the battle-field some days after the battle, on his way to Fort Dayton, wrote: "I beheld the most shocking sight I had ever witnessed. The Indians and white men were mingled with one another just as they had been left when Death had first completed his work. Many bodies had also been torn to pieces by wild beasts."

During the heat of the combat in the ravine, Colonel Willett made a sally from the fort with a force of two hundred and fifty men. He drove in the enemy's advanced guard, and attacked the residue of Sir John Johnson's regiment with such headlong impetuosity that they fled for their lives, led by the baronet himself in his shirt sleeves. The victorious detachment rushed on to the Indian encampment, and hastily demolished it, firing with marked effect upon the few savages left in charge, who, at the first appearance of Colonel Willett—known among the Six Nations as "the Devil"—had fled precipitately. Wagons were hurried out from the fort, and twenty-one loads of camp equipage, clothing, cooking utensils, blankets, stores, etc., together with all the private property of the British officers—papers, plans, journals, five British flags, and Sir John's coat—were conveyed to the fort, while the brave little band held the dismantled encampment. As Willett was returning, Colonel St. Leger suddenly appeared with a considerable force on the opposite side of the river, just in time to receive an effective salute of bullets from the militia, who reached their stronghold without having lost a man, and with the satisfaction of having discomfited and despoiled their besiegers. The sun, sinking at the close of that sultry August day in crimson pomp behind the western pines, bathed in a flood of ruddy light five of St. George's crosses, flapping idly in the evening breeze, over the tiny forest fort, under a rude garrison-made ensign of stars and stripes.

Although the Provincials were technical-

ly victorious at Oriskany, they returned to their homes in any thing but triumph; they were totally unable to follow up their advantage or afford their beleaguered comrades any assistance. Relying upon that inability, and the ignorance of the garrison regarding the result of the battle, St. Leger immediately demanded the capitulation of the fort, threatening the devastation of the entire valley settlements by fire and sword and tomahawk if it was refused. Colonel Gansevoort rejected all his offers, somewhat ungraciously, as unworthy of a British officer or a gentleman.

On the night of the 10th, Colonel Willett, in company with Major Stockwell, started out, armed only with a spear, and with no blankets or provisions other than a small store of crackers and cheese, through the forest for the German Flats, which, after standing during the greater part of the first night motionless in a morass, subsisting for a day upon berries, and encountering the severest hardships, they reached on the afternoon of the 12th. Colonel Willett was deservedly popular in this vicinity, and the militia had begun to assemble again in great numbers in answer to his earnest appeal, when General Arnold, four days after Willett's arrival, reached Fort Dayton with a large force of troops, which had been dispatched by General Schuyler from Albany upon learning of Herkimer's disaster. Here Arnold, who, despite his reputation for rash, reckless bravery, understood the strength of the enemy better than did his unfortunate predecessor, determined to rest, either until re-enforcements from Albany should arrive, or the yeomen of the county had joined his standard in numbers sufficient to warrant a second attempt to relieve the fort.

In the mean time, St. Leger, despairing of obtaining bloodless possession of that stronghold, began pushing hostile operations with great vigor. He approached by sap to within 150 yards of the fort, and from this point began to throw shells into the inclosure. Their provisions daily exhausting, entirely cut off from all outside communication, ignorant of the large force that was assembling in the valley below for their relief, and remembering the horrible fate of the inmates of Fort William Henry, many of the garrison began to whisper ominously about a capitulation; and it is said that Gansevoort had resolved upon a desperate attempt to cut through the enemy's lines, when, without any apparent cause, the besiegers suddenly broke up their camps and retreated in great confusion. So hurried was their flight that they left their tents, together with nearly all their artillery and camp equipage; and the 22d of August, which had dawned upon a siege in full progress, and with every prospect of suc-

cess, ere its close, saw the British host leave the Mohawk Valley in headlong haste.

That the reader may understand this sudden movement, so mysterious and unexpected to the jubilant garrison, it will be necessary to go back to Fort Dayton, where we left Arnold restless and impatient under his self-imposed restraint. A party of Tories, meeting clandestinely at the farmhouse of a loyalist—by name Shoemaker—had been captured and imprisoned by Colonel Weston, at that time in command of the fort. The occasion of the gathering was the arrival of young Walter Butler from St. Leger's camp with copies of Sir John Johnson's last appeal to the loyalists of the valley. Butler and his associates were tried as spies by a court-martial of Arnold's, and condemned to die. Among those who found themselves in this predicament was a certain Hon-Yost Schuyler, one of the coarsest, most ignorant men in the valley, and generally regarded as little better than an idiot, yet, as the sequel will show, possessed of considerable shrewdness withal. His mother and brother, upon hearing of his misfortune, hastened to Fort Dayton, and implored the commander to spare him. The pathetic eloquence with which, in a frenzy of grief, the old woman plead for the life of her wayward son, who had added the crimes of a guerrilla to that of being a spy, would have moved a heart less stony than that she addressed. But Arnold, never very tender-hearted, was stern and inexorable, until a sudden idea occurred to him, in the execution of which this idiot could be used to excellent advantage. Accordingly he melted, and promised the overjoyed mother the life of her son, upon conditions. These were, that he should hasten to the British camp, and so alarm St. Leger as to induce him to raise the siege and fly. Hon-Yost gladly accepted the terms, and having made arrangements with some friendly Oneidas to aid him at the proper moment, set out at once on his mission, leaving his brother in prison as a hostage for his fidelity and success. He first presented himself among the Indians, who, moody and dissatisfied at their repeated losses, and angry at St. Leger for promising them an easy victory and abundant plunder, had convened a pow-wow for the purpose of considering the dubious enterprise in which they had been engaged, and who were in a suitable state of mind to catch eagerly at the news he brought them of Arnold's rapid approach. He pointed out the bullet-holes in his coat (carefully made by the Provincials before he left) as evidences of his own narrow escape; and when questioned by them as to the number of Arnold's force, he shook his head, and pointed mysteriously to the overhanging leaves. He was taken at once to St. Leger's tent, and gave to the colonel a

pitiful account of his trials, claiming to have escaped, while on the way to the gallows, through a shower of bullets, the marks

"They are coming! they are coming!" We can fancy the grim wink that was interchanged by these stolid, stately sachems as their com-

"THE OLD WOMAN PLEAD FOR THE LIFE OF HER WAYWARD SON."

of which he could see for himself. He asserted that Arnold was within twenty hours' march, at the head of 2000 regulars.

Meanwhile the Oneidas had arrived in the camp and spread a similar report, the effect of which was all that the most exacting Whig could desire. The Indians had long since become heartily sick of this besieging business, and eagerly seized upon this report as a pretext for decamping. In vain St. Leger stormed and swore, useless were the pleas and tears of Sir John; the savages had an answer pat—"the pow-wow said we must go," and go they did in utmost haste.

Furious at being so shamefully deserted, St. Leger reproached the baronet roundly for the defection of his copper-hued friends, while Sir John retorted by charging the former with an indifferent prosecution of the siege. Two sachems who were standing near put an end to the unpleasantness by yelling out, in a sudden paroxysm of terror,

manders rapidly threw together a few necessities, and, as the shout spread through the camp, gave a hasty order to retreat, and glided away in the gathering dusk, closely followed by their panic-stricken troops. The Indians, enjoying the terror and confusion of their allies, who threw away guns, knapsacks, and all else that impeded their flight, repeated the joke until the rabble reached Oneida Lake. Thence St. Leger hastened on to Oswego and Montreal.

Compared with the more extensive conflicts of the Revolution, that in defense of Fort Schuyler must appear insignificant; but as a desperate and heroic struggle—fierce and bloody beyond parallel—and as a terrible blow to the plans and prospects of the crown, it deserves, together with its heroes, famous and nameless, who laid down their lives before the invading foe, a prominent and enduring place in the chronicles of our forefathers' heroism.

WESTMINSTER ABBEY.

IT is not easy for an American to appreciate the feelings with which a reverential resident of the Old World is inspired by one of its grand abbeys, cathedrals, or basilicas. But he must be not only a devoted but a bigoted worshiper of the new who can be oblivious in Westminster Abbey of the peculiar and subtle influence which pervades what is, or at least claims to be, the oldest house of worship in Christendom—five centuries superior in the virtue of age to the basilica of St. Peter's at Rome. As he sits under this arched roof, surrounded by the

tering memories throng about him, a thousand voices join in response with his own—Protestant and Roman Catholic, Episcopalian and Presbyterian, monarchical and republican, Anglican and Norman, saintly and insincere.

For this marble pile, or at least some portion of it, has, as it were, nursed England from its very infancy. Like an aged grandam, who lives to an honorable decrepitude to see standing before her, in stalwart and noble manhood, the boy whom she has loved with tender affection, and over whose oft-

NORTH AMBULATORY AND CHANTRY.

noble dead who lie buried beneath the consecrated floor, and environed by the historic memories which render the very atmosphere a perpetual incense, and listens to a service which, substantially in its present form, has been repeated within these walls, as the vehicle of worship, ever since the days of Edward VI., and in its substantial expression of thought and feeling is almost as old as Christianity itself, he is caught out of the present without being carried into the past, and abides in a singular state, which gives him a shadowy conception of what the theologians mean (and perhaps they have no more than a shadowy conception themselves) when they say that to God there is neither past, present, nor future. A thousand clus-

times erratic and sometimes turbulent course she has watched with solicitous care, whose mother confessor she has been, the confidante of his secrets, the sharer of his sorrows, and the shriver of his sins, Westminster Abbey of to-day looks on the England of the nineteenth century, which she nursed in the eleventh, and guided and guarded through all the tempestuous experience of the turbulent youth time that intervened before years brought experience, and experience discretion and self-control. It has seen England successively Saxon, Norman, and English. It has seen it Roman Catholic, Protestant, Roman Catholic, and Protestant again. It has seen it an absolute monarchy, a constitutional monarchy, a re-

public, and a monarchy again. Within its walls mass has been chanted and the Anglican service has been read, and under its roof the Westminster Assembly's Confession of Faith was organized, and from thence was published. It lived through the wars of Normans and Saxons, welcomed William the Conqueror, witnessed the alternate despotism and abject submission of John, saw the Magna Charta wrested from his unwilling hands, beheld the land ravaged with the long wars of the rival roses, barely escaped demolition in the hideous but fruitful reign of Henry VIII., was re-clothed with honor in the more hideous and barren reign of Bloody Mary, rejoiced in the peaceful and benignant reign of the unscrupulous but sagacious Queen Bess, witnessed the conflict between constitutional law and Cæsarism, culminating in the death of Charles I., but ending only with the accession

of William and Mary. Born on an island remote from any town, and environed by an almost impenetrable wood, it has lived to see London stretching out its boundaries till now the once secluded resort of world-wearied monks is in the heart of the busiest and most populous commercial centre of Christendom. Born in an age without carriage roads, it has lived to see the island of Great Britain intersected by innumerable railways. Born in an age when commerce was unknown, when piracy was honorable, when war was a trade, and consequently there was little trade but war, when post-offices were unknown, because few knew how to write, and books unheard of, because the printing-press was as yet unconstructed and few knew how to read, it has lived to see the Anglo-Saxon race mistress of the ocean by its commerce rather than its navy, master of the world by its civilization rather than its arms, laying aside the bow for the cannon, and the cannon for the printing-press, substituting for the activities of the mere animal vigor of its sometimes brutal boyhood the more enduring and beneficent activities of refined manhood.

But Westminster Abbey is more than a witness of history. It is itself a history.

Its true origin antedates the days of Edward the Confessor (1042-1066), who may, however, with propriety be regarded as its founder. His superstitious devotion to the see of Rome, which secured for him after his death the more than regal honors of canonization, led him while living to deter-

WESTMINSTER ABBEY.

mine to consecrate some gift worthy of a king to his patron saint, Peter; and this determination he emphasized by a solemn vow, recorded in his early life, to make a pilgrimage to the apostle's grave at Rome. From this vow, on the urgency of his Great Council, he obtained papal release, promising in lieu thereof a more profitable service in the erection of a monastery of St. Peter. Two leagues from the then city of London, forming at this point the west bank of the river Thames, lay the Isle of Thorns, a wild jungle where the wild ox and the huge red deer found a welcome home—a forest environed by forests, a marsh surrounded by marshes. Its situation afforded, however, that solitude which the monks of the Middle Ages sought, while a clear spring, bubbling up with ceaseless flow in the middle of the isle, supplied them with water, and the neighboring river afforded them abundant fish. There, founded no man knows when or how—so early that even the legends of its origin are contradictory—there existed a little monastic community, with their minster or chapel of St. Peter, the counterpart of the St. Paul's whose foundations were even then laid in the centre of what was to become the busiest commercial mart in the world. The ancient rivalry between these two ecclesiastical monuments assumes, in the light of later history, a curious significance, if we venture to regard for a moment, as some have done, Peter as the patron saint of Romanism, and Paul as the peculiar apostle of Protestantism. This little minster of St. Pe-

ter, Edward resolved to adopt as the foundation of the sacred edifice which was at once to fulfill his vow and perpetuate his fame. And this determination was sanctioned by a supernatural occurrence which an ancient legend connected with this most ancient building.

"It was on a certain Sunday night"—Dean Stanley shall tell us the legend in his own admirable words—"in the reign of King Sebert, the eve of the day fixed by Mellitus, first Bishop of London, for the consecration of the original monastery in the Isle of Thorns, that a fisherman of the name of Edric was casting his nets from the shore of the island into the

ARTHUR PENRHYN STANLEY, DEAN OF WESTMINSTER.

Thames. On the other side of the river, where Lambeth now stands, a bright light attracted his notice. He crossed, and found a venerable personage, in foreign attire, calling for some one to ferry him over the dark stream. Edric consented. The stranger landed, and proceeded at once to the church. On his way he evoked with his staff the two springs of the island. The air suddenly became bright with a celestial splendor. The building stood out clear, 'without darkness or shadow.' A host of angels, descending and re-ascending, with sweet odors and flaming candles, assisted, and

the church was dedicated with the usual solemnities. The fisherman remained in his boat, so awe-struck by the sight that when the mysterious visitant returned and asked for food, he was obliged to reply that he had caught not a single fish. Then the stranger revealed his name: 'I am Peter, keeper of the keys of heaven. When Mellitus arrives to-morrow, tell him what you have seen, and show him the token that I, St. Peter, have consecrated my own Church of St. Peter, Westminster, and have anticipated the Bishop of London. For yourself, go out into the river; you will catch a plentiful supply of fish, whereof the larger part shall be salmon. This I have granted on two conditions—first, that you never fish again on Sundays; secondly, that you pay a tithe of them to the Abbey of Westminster.'

"The next day, at dawn, 'the Bishop Mellitus rises, and begins to prepare the anointing oils and the utensils for the great dedication.' He, with the king, arrives at the appointed hour. At the door they are met by Edric, with the salmon in his hand, which he presents, 'from St. Peter, in a gentle manner to the bishop.' He then proceeds to point out the marks 'of the twelve crosses on the church, the walls within and without moistened with holy water, the letters of the Greek alphabet written twice over distinctly on the sand' of the now sacred island, 'the traces of the oil, and (chiefest of the miracles) the droppings of the angelic candles.' The bishop professed himself entirely convinced, and returned from the church satisfied that the dedication had

ST. PETER, IN THE RETABULUM.

been performed sufficiently—better, and in a more saintly fashion, than a hundred such as he could have done.”

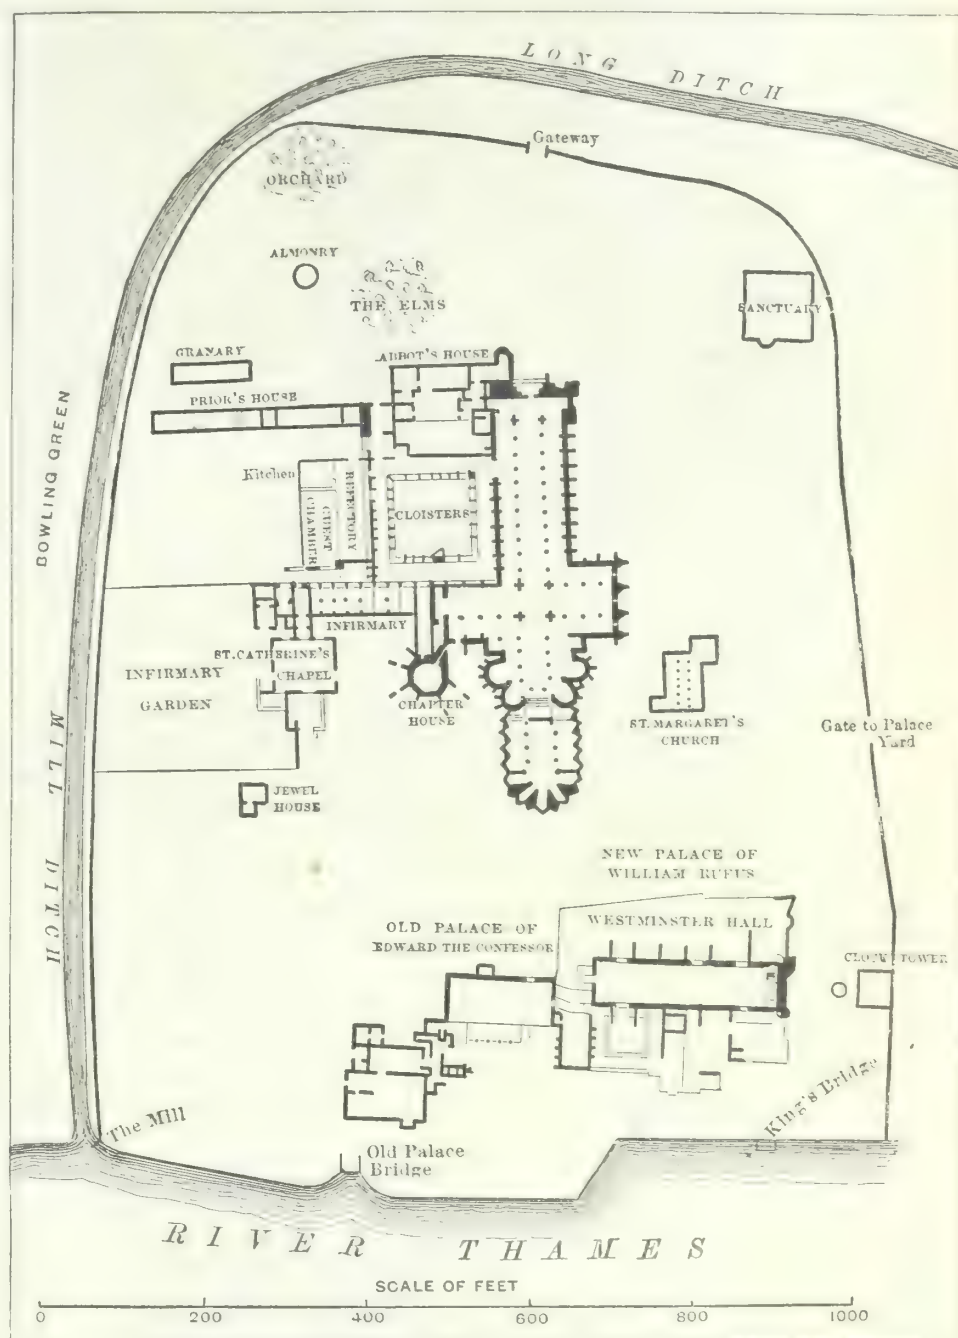

Such is the mythical story of the origin of what, in its full title, long since dropped out of common use, is the “Collegiate Church or Abbey of St. Peter.”

One might have imagined that such a dedication would have preserved the ancient church from destruction. But the king was determined that antiquity should not share with him the glory of the new Church and Abbey of St. Peter. The old building was torn down; a new one was built up from the very foundation. Its size was seemingly portentous. It filled nearly, if not quite, the whole area occupied by the present edifice. Cloister, chapter-house, refectory, dormitory, infirmary, all entered into the royal plans, if, indeed, all were not completed in the king's lifetime. It was fifteen years in building. Upon it the king spent one-tenth of the property of the kingdom. It was a marvel of pious munificence. Of all his work, little now remains except the general plan of the building, which has been preserved in all subsequent changes, and the substructures of the dormitory,

with their large pillars, grand and regal at their bases and capitals, which are still shown as an indication of what was the character of this most ancient sanctuary.

A period of two hundred years brings us to the reign of Henry III., the first truly English king, whose reign marks, indeed, the commencement of English history and civilization. The superstitious piety of Edward the Confessor repeated itself in Henry III. Even St. Louis seemed to him lukewarm. Visiting France, he kept the French

peers so long waiting, by stopping to hear mass in every church he passed, that St. Louis caused the churches to be closed. Admonished that he ought to hear sermons as well as attend mass, he made the apt rejoinder that he would rather “see his friend than hear him talked about.” Three masses a day were as few as sufficed to satisfy the demands of his piety. He determined to embody his devotions in a permanent mon-

WESTMINSTER ABBEY AND ITS PRECINCT, ABOUT A.D. 1535.

ument, to rebuild the church and abbey of St. Peter in a form which should render it incomparable for its beauty even in that age famous for its art. The massive pile which then stood on the site of the present edifice, sacred with the historic memories of Edward the Confessor and William the Conqueror, was taken down. Iconoclasm is not a purely American characteristic. The whole structure was rebuilt in what was then the prevailing style. The memory of the original founder was preserved, not by

SHRINE OF EDWARD THE CONFESSOR.

leaving any part of his handiwork for the purpose of perpetuating his name, but by the construction of the Shrine of the Confessor, constructed by a Roman architect, and elaborately ornamented. The shrine still stands, though modified by the hand of time and subsequent architects. The whole work was carried on upon a scale of magnificence that stopped at no extravagance. A single fact indicates better than figures can do the expenditures involved—they were so great, and occasioned exactions so heavy, that they called into being the House of Commons to protest against them. Thus Westminster Abbey and the English constitution were born together. It is thus a fitting choice which places the Houses of Parliament alongside the Abbey church which called it into being.

From that day to this the building remains in substance as Henry III. designed it, though with innumerable accretions,

cent church. But it is, in truth, but a small portion of the Abbey. Nor is it the architectural beauty of its arches, nor the echoing of the music of the grand organ in its lofty roof, nor the dim religious light which pours in through the richly ornamented windows, which gives to the service here its peculiar significance. It is the sense that we are in the presence of centuries; that here, all about us, are the memorials of the many

noble dead; that here history is written not on paper or on parchment, but by the graver's knife in wonderful characters upon a volume of stone.

Two features give to Westminster Abbey a peculiar character. For years it has been both the birth-place and the burial-place of royalty. Here every king of England since the days of William the Conqueror has been crowned, and here the royal ashes have been laid for their last repose, certainly ever since the days of his predeces-

CAPITAL OF WALL ARCADE.

sor, Edward the Confessor. Coronation was pre-eminently a religious ceremony—of all religious ceremonies the most solemn, imposing, and important. It lends, therefore, to Westminster Abbey no slight additional grandeur in the eyes of a devoted adherent of royalty that for over eight centuries the

tradition saith not, though doubtless the fact that Ireland has been in a state of chronic anarchy ever since, except when kept quiet by foreign domination, is to be attributed to the absence of this invaluable bit of rock. At all events, Edward the Confessor found it in Scotland, in the Abbey of Scone, in-

THE CHOIR, LOOKING WEST.

kings of England have been crowned in it. The two objects which the verger shows the tourist with the greatest reverence are the coronation chair and the coronation stone.

The stony pillow on which Jacob slept was carried by his descendants to Egypt. (Since we are going into tradition, we may as well go as far back as tradition can carry us.) This stone, after various migrations, which the ancient chronicles narrate with great particularity, at length reached Ireland in its wanderings. Here it served a useful purpose to a rude age by detecting the false claims of would-be monarchs. Each new claimant to the throne was placed upon this stone. If the chief was the true successor, the stone was silent; if he was a pretender, it groaned aloud. How so useful a tester of royal character slipped out of Irish grasp,

closed in a chair on which, for a length of time which history refuses to measure, all Scottish kings had been crowned. He brought it with him to England, had built for it the chair which still contains it, and resisted, as have his royal successors, every attempt on the part of Scotland—and they have been numerous—to recover this holy

SPANDREL OF WALL ARCADE WITH SHIELD.

CORONATION CHAIR.

"stone of Scone." From that day to this, in this chair, and on this very stone, every English sovereign, from Edward the Confessor to Queen Victoria, has been inaugurated. Once only has it been moved out of the Abbey, and that, says Dean Stanley, "for an occasion which proves, perhaps more than any other single event since its first capture, the importance attached to it by the rulers and people of England. When Cromwell was installed as Lord Protector in Westminster Hall, he was placed in the

'Chair of Scotland,' brought out of Westminster Abbey for that singular and special occasion."

The chair itself has little to interest any one but the antiquarian; and its homely appearance almost justifies Goldsmith's sneer: "I could see no curiosity either in the oak chair or the stone. Could I, indeed, behold one of the old kings of En-

CORONATION STONE.

gland seated in this, or Jacob's head laid on the other, there might be something curious in the sight." The old chair, with its iron rings, its battered surface, the great crack which seems to threaten to rend it in two, and the great host of names of visitors, themselves ambitious of fame, scratched over its surface, would hardly be allowed

WALL ARCADE.

with patience, despite its honored history, a place in the parlors of the palace of any of the republican princes of New York.

It would take us too far from our present purpose, a visit to the Abbey itself, if we

nious, simple or ornate, reverential or indecorous—according to the fancy of the king. But one feature common to almost every coronation ought not to be passed by in silence, since it connects the building of the

INSTALLATION OF THE KNIGHTS OF THE BATH IN 1812 IN HENRY VII.'S CHAPEL.

were to stop to witness the coronation ceremonies, which, though alike in certain general features, have differed in different reigns—martial or civic, extravagant or parsimo-

Abbey with one of the famous orders of knighthood in Christendom, the "Knights of the Bath." Ever since at least as early as the fourteenth century, a cavalcade from

the Tower to the Abbey has been a part of the coronation ceremonies. In this have participated a body of knights created for that purpose, who, as a part of their preparation for assuming their knightly dress, are first washed in a bath, whence the title of their famous order. For many years the installation of the Knights of the Bath took place in Henry VII.'s chapel, the structure built out at the rear of the Abbey, and it is this service, as performed for the last time in 1812, that our artist represents.

If interest attaches to the Abbey as the place of the coronations of the kings of England, sacredness attaches to it as the place of their interment. More noble dust (if nobility can be predicated of dust) is doubtless gathered beneath this roof than on any ground of similar size in Christendom. There sleep their last sleep the noblest of England's dead, at least her most honored dead. Here lie, side by side in peaceful slumber, kings and nobles who fought in deadly rivalries and animosities while they were living.

At these royal tombs history and the drama meet; for what lover of Shakspeare has forgotten the Henry V. of the great dramatist. In his life he had cherished a peculiar veneration for the Abbey. By his will he directed his body to be laid there. From the hour of his conversion from a wild, licentious youth to a steady, determined man, he became not only the greatest soldier of the age, but also a most devoted son of the Church. Under his direction the nave was completed in very nearly its present form by the great architect, famous to American childhood chiefly from the story of the turn in his fortunes, Whittington, Lord Mayor of London. By Henry the convents and monasteries were enriched by many a

royal gift. So little was he inclined to carry out in his reign that vice of intoxication which characterized his youth, that he is said to have resolved, if he conquered France, to destroy all its vines in order to suppress drunkenness. The oaths with which, as a companion of Falstaff, he so plentifully interlarded his conversation were abandoned, and in lieu thereof he substituted "Impossible," or "It must be done." The funeral pageant which accompanied the remains of this singular monarch to the Abbey was the grandest which had ever been known. The monument which remains to

mark them is among the finest in the Abbey. "He alone of all the kings hitherto buried in the Abbey had ordered a separate chantry to be erected, where masses might be forever offered up. It was to be raised over his tomb. It was to have an altar in honor of the Annunciation. It was to be high

CHANTRY OF HENRY V.

enough for the people down in the Abbey to see the priests officiating there. Accordingly a new chapel sprang up, growing out of that of St. Edward, and almost reaching the dignity of another Lady Chapel. It towers above the Plantagenet graves beneath, as his empire towered above their kingdom. As ruthless as any improvement of modern times, it defaced and in part concealed the beautiful monuments of Eleanor and Philippa. Its statues represent not only the glories of Westminster in the person of its two founders, but the glories of the two kingdoms which he had united—St. George, the patron of England; St. Denis, the patron of France. The sculptures round the chapel break out into a vein altogether new in the Abbey. They describe the personal peculiarities of the man and his history—the scenes of his coronation, with all the grandees of his court around him, and his battles in France..... Aloft were hung his large emblazoned shield, his saddle, and his helmet, after the example of the like personal accoutrements of the Black Prince at Canterbury."

Coming down to a later date, it is significant of the brevity of life's bitterest battles that here, in the chapel of Henry VII., adjoining each other, are the tombs of Bloody Mary, the last Roman Catholic sovereign, and Queen Elizabeth, whose life only her own sagacity saved from the executioner, while but a few feet distant is the tomb of Mary, Queen of Scots, who died on the block by Queen Elizabeth's warrant.

It is not, however, the royal tombs alone which excite the visitor's interest, or even most attract his attention. To the ordinary visitor the uncrowned royalty of England possesses great interest, and draws to its tombs a greater number of sight-seers than do the kings themselves. To be buried in Westminster, to enter immortality through this "Beautiful Gate," to sleep in the same mausoleum with so many honored

CHAUCER'S MONUMENT.

and honorable dead, is the highest ambition of the Englishman. Burial here is the last reward which a grateful nation can award the faithful citizen who, with sword, or pen, or voice, has served it well. "Victory or Westminster Abbey!" was the electric cry with which Nelson inspired his followers in the battle of Cape St. Vincent. We are not writing a guide-book.

The most famous portion of the Abbey, doubtless, and that where the tourist loves to linger longest, is the Poets' Corner. Here are gathered the names of the princes of more than royal blood whose achievements

have given England that literature which is of greater worth than all her colonial possessions and commercial wealth, and stands next only to those liberties which have been gained by her martyrs, guarded by her statesmen, and defended by her warriors. From a forest of marbles, which by their very number daze and bewilder the spectator, we select but two—those of Chaucer, the founder of English poetry, and Shakspeare, the creator of the true English drama.

These are the monuments of the dead as they are shown to the ordinary visitor, but they are not the only monuments; they

SHAKSPEARE'S MONUMENT.

are not the most solemn and affecting. In more than one instance investigations have brought to light the metallic coffins in which noble dust was inclosed, still preserved through years that have rolled on even into centuries. Of these investigations, perhaps

PART OF THE GRILLE OF HENRY VII.'S TOMB.

the most interesting, as it certainly was the most assiduous and determined, was that prosecuted for the purpose of discovering the remains of James I., known to have been buried somewhere within the walls of Westminster. The romantic story of the under-ground search is too long, and in the telling would perhaps be too tedious, for these pages. It was not until every inch of conceivable space in the chapel of Henry VII. had been explored that the actual vault of Henry VII. itself was opened. On opening the marble pavement at the west end of the royal tomb, evidences were found that the ground had been broken beneath. The excavators cleared it away, and came upon a wall

which evidently closed an ancient entrance to a vault. It was with a feeling of breathless anxiety, amounting almost to a solemn awe, that they approached the consummation of their long search; and it was with a sense of chastened and solemn satisfaction that they discovered within the vault, side by side, three leaden coffins, whose inscriptions proved two of them to be the final resting-places of the bodies of James I. and Henry VII., while a surmise, whose accuracy there is no reason to doubt, attributes the third and centre one to the latter's queen, Elizabeth of York. Henry VII. died in 1509. This disinterment took place in 1869. For over three centuries and a half these royal remains had dwelt in this forgotten vault, and the coffins of both king and queen were still unharmed by the touch of decay. In the picture the coffin on the reader's left is that of James I.; on the right, that of Henry VII.; the centre coffin is that of Elizabeth, the wife of the latter monarch.

But it is time, unless we mean to confine our present visit to the church, for us to leave what to most minds constitutes Westminster Abbey, but is, in reality, only a part of it, to visit the adjacent buildings, which, indeed, constitute quite as important a portion of the original Abbey as the church and its surrounding chapels.

For, as our readers have already perceived, Westminster Abbey is not merely a church. In its historic origin it was a monastery, of which its church or chapel was but a subordinate part. Around this monastery grew up an independent community under the protection of the ecclesiastics who dwelt within. The monastic society has long since passed away, but time has swelled the surrounding precincts into the city of Westminster, one of the several distinct municipalities into which the city of London is divided, or rather, to speak more accurately, of which it is composed. Until as late as 1776 there remained the ancient gateway which led into this city of Westminster and separated it from the adjoining country. Over this gateway

MONUMENT OF RODNEY'S CAPTAINS BAYNE, BLAIR, AND MANNERS, MORTALLY WOUNDED IN THE NAVAL ENGAGEMENT OF APRIL 12, 1782.

were constructed two chambers, which served, the one as a prison for convicted clergy and Roman Catholic recusants, the other for lay offenders. It was in this latter chamber that the famous but unfortunate Raleigh spent his last night on earth; here took place that famous parting with his wife memorialized in the picture which is to be seen on the parlor walls of so many houses; hence he went forth to the scaffold bearing a "mery hearte" to the last. Here, too, Hampden expiated by his imprisonment his love of freedom; and here Captain Bell, who had often proposed to translate Luther's *Table Talk*, but had been prevented by other businesses, found in involuntary imprisonment both time and place for his work. The old Gate-house is pulled down now, and nothing, we believe, remains to mark the boundary line of the precincts.

COFFINS OF JAMES I., ELIZABETH OF YORK, AND HENRY VII., AS SEEN ON OPENING THE VAULT IN 1869.

THE CLOISTERS, WITH ENTRANCE TO THE CHAPTER-HOUSE.

But though the monastery itself has long since ceased to exist, the great pile of buildings still remains, employed in various educational and ecclesiastical uses. As the visitor is carried through the cloisters he wonders how the monks of old succeeded in carrying on, in this long and partially open hall, the various operations which belonged to it. There the younger monks underwent the all-important operation of shaving, once a fortnight in summer, and once in three weeks in winter. Here on Saturday their heads and feet were religiously washed. Here, too, was the monastic school. Here the monks carried on their writings and illuminations, and studied grammar and logic and philosophy. A strict school it was; no signals, no jokes; in communication no language but French. English and Latin were expressly prohibited. The product of this monastic institution still remains in the famous Westminster School, the Protestant product of the Roman Catholic planting. The fame of one of its head-masters, Dr. Busby, has passed into history, and spread on both sides of the Atlantic.

It is difficult, however, for us to imagine how these various operations were carried

on in the cloisters. "The upper tracery of the bays appears to have been glazed; but the lower part was open then as now, and the wind, rain, and snow must have swept pitilessly alike over the brethren in the hands of the monastic barber and the novices turning over their books or spelling out their manuscripts. The rough carpet of hay and straw in summer and of rushes in winter, and the mats laid along the stone benches, must have given to the cloisters a habitable aspect, unlike their present appearance, but could have been but a very inadequate protection against the inclemency of an English frost or storm."*

Just over the East Cloister was the Dormitory; just beyond the Cloister the Refectory. Each

monk had his own chest of clothing, limited like that of a sailor or a school-boy. The

WOODEN CASE OF LEADEN COFFIN OF QUEEN ELIZABETH.

monkish meals could not have been very social affairs, since no monk was permitted

* *Memorials of Westminster Abbey*, by Dean Stanley, p. 424.

to speak at all, and no guest was allowed to speak above a whisper.

At first thought it would seem inappropriate that these unworldly monks should be mixed up in any wise with the secular affairs of the kingdom. But on second thoughts, who so appropriate to be intrusted with the wealth of the kingdom as these saints who have forsworn the world and retired to this sacred retreat, giving up all hope of earthly emolument, and covetous only of heavenly riches? So here, in a room which goes by the name of the Chapel of the Pyx,* for many years were stored the treasures of the kingdom. Some of the great chests used of old time for the storage of valuables still remain, though the treasures have long since been removed, for, alas! even monks are not exempt from the necessity of praying, "Lead us not into temptation." The world's treasures proved too great a snare for the "carnal heart" which still remained in some of these pious monks. Over five centuries have passed since the robbery which resulted in the removal of these treasures from their custody, and the details are not now known. But it was afterward observed that in that year, 1303, the gardener who came to do the usual mowing was refused admittance. It was believed that in the long grass intermixed with hemp, sown and grown in spots for that very purpose, the treasures were concealed, after they had been taken by stealth from the king's treasury. Thence they were conveyed away secretly by the river. A long trial, ordered on the discovery of the robbery, resulted in the release of the abbot, but in the implication of the superior and the sacrist. What punishment was inflicted on them is not known; but inside and outside the door by which to-day the Chapel of

EARLY ENGLISH CHEST IN THE CHAPEL OF THE PYX.

the Pyx is approached may be felt, under the iron cramps, fragments of what modern

* The pyx, which gives its name to this chapel, is the box kept at the Mint in which specimens of the coinage are deposited. The word "pyx" (originally the Latin for "box," and derived from the pyxis or box-tree) is now limited to this depository of coins in the English Mint, and to the receptacle of the host in Roman Catholic churches.

science has declared to be the skin of a fair-haired, ruddy-complexioned man. The same terrible lining is affixed to three doors in an adjoining apartment of the Abbey. It is not impossible that they are the remains of the offending monks, and served

ENTRANCE FROM THE CLOISTER TO THE CHAPTER-HOUSE.

as a warning to their brethren, who witnessed the terrible punishment, not to set their affections upon things on the earth.

We have already remarked how intimately the history of Westminster Abbey is connected with the history of the English constitution, how out of the extravagant expenditures lavished on the Abbey sprang, to protest against them, the English House of Commons. The visitor is still shown in the Chapter-house the place where the first

meetings of the House of Commons were held, six hundred years ago. The crypt beneath is believed to date back to the days of Edward the Confessor. Here were the first burials in Westminster, the entombments which led to those subsequent burials which have made Westminster Abbey the grandest cemetery in Christendom.

EXTERIOR OF THE JERUSALEM CHAMBER.

The Chapter-house derives its name from its object—the house where the chapter, the governing body of an abbey, meets for legislative purposes. Here, at least once a week, the whole council were accustomed to meet in solemn session. Here complaints and confessions were heard, and trials had, and punishments administered—the rod on the bared back well laid on. Hither, therefore, the House of Commons, when they first separated from the House of Lords, came for their first consultations. Here were passed many of those laws familiar to the student of English history, some of which have since become the common law of both England and America—the statutes of Provisions and Præmunire, the laws repudiating

papal authority and establishing that of the king, and those which laid the foundation of the Church of England, in the place of a church ruled by a foreign potentate. It is no longer appropriated to legislative uses. The House of Commons held its last session here in the dying hours of Henry VIII.; the dean and chapter of the present Abbey hold their sessions in the Jerusalem Chamber; the Chapter-house has been remodeled, an upper story formed, cases fitted to the walls, and the whole adapted to the duty of holding certain governmental public records.

The Jerusalem Chamber itself, though an unpretentious building alike in its external appearance and its internal arrangement, is connected with two events in the history of England, the one of which the great dramatist of English literature has rendered famous forever, the other of which has exerted an influence on all English-speaking nations such as is simply incalculable.

Here it was that Henry IV., coming up to London, covered with a hideous leprosy, and almost bent double with pain and weakness, laid him down to die. It was, apparently, the only room in the Abbey which had conveniences for a fire. It was the early spring; the Abbey itself was chilly; and to the Jerusalem Chamber the king was carried by

CRYPT OF THE CHAPTER-HOUSE.

THE JERUSALEM CHAMBER.

his attendants, and there laid upon a pallet before the great fire-place. It is in a room in the palace of Westminster adjoining that Shakspeare places that most affecting scene, in which the young prince puts on his own head the crown of his sleeping father; and thence he represents the king carried at his own request to the Jerusalem Chamber for his death.

King Henry. Doth any name particular belong
Unto the lodging where I first did swoon?

Warwick. 'Tis call'd Jerusalem, my noble lord.

King Henry. Laud be to God!—even there my life
must end.

It hath been prophesied to me many years,
I should not die but in Jerusalem;
Which vainly I suppos'd, the Holy Land:—
But, bear me to that chamber; there I'll lie;
In that Jerusalem shall Harry die.

The other, and more important, though less dramatic, scene, which renders this chamber memorable in history, is intimately connected with the history of the church and the development of theology. Here it was, driven by the cold, as Henry IV. had been, from the Abbey itself, that the famous convocation of Presbyterian clergy was held which undertook to change the entire character of the Established Church of England, but which, ending seemingly in failure, really resulted in organizing a church whose scope and influence have outrun their wildest dreams. This little chamber is the birth-place of the Presbyterian denomination. Here, and in the chapel of Henry VII., changing their sessions in part according to the weather, sat the famous Westminster Assembly. Out of these walls came the Directory, the Longer and Shorter Catechisms, and that famous Confession of Faith

which is still the accepted symbol of theological doctrine of one of the largest Protestant denominations in England and the United States.

In this chamber sit the committee now engaged in the revision of the Bible.

THE CLOUD.

FAR, on the brink of day,
Thou standest as the herald of the dawn,
Ere fades the night's last flickering spark away
In the rich blaze of morn.

Above the eternal snows,
By winter scattered on the mountain height
To shroud the centuries, thy visage glows
With a prophetic light.

Calm is thine awful brow:
As when thy presence shined divinity,
Between the flaming cherubim, so now
Its shadow clings to thee.

Yet, as an angel mild,
Thou, in the torrid noon, with sheltering wing,
Dost o'er the earth, as on a weary child,
A soothing influence bring.

And when the evening dies,
Still to thy fringed vesture cleaves the light,
The last sad glimmer of her tearful eyes,
On the dark verge of night.

So, soon thy glories wane!
Thou, too, must mourn the rose of morning shed:
Cold creeps the fatal shadow o'er thy train,
And settles on thy head.

And, while the wistful eye
Yearns for the charm that wooed its ravished gaze,
The sympathy of nature wakes a sigh,
And thus its thought betrays:

Thou, like the cloud, my soul,
Dost, in thyself, of beauty naught possess;
Devoid the light of Heaven, a vapor foul,
The veil of nothingness.

A BEAUTIFUL CHARITY.

IN the advance of the age it can not but be noticed that the progress observable in art, science, and civilization generally is in no way lacking in matters of charity. In olden times the man who carried a pocket full of loose coins and distributed them with reckless good nature to whatever vagabonds crossed his path, was called benevolent, and the lady who charged her servants that no beggar should go empty-handed from her door, was deemed the patroness of the poor. Thus hordes of beggars and vagabonds were

Prominent among these, in New York, and drawing to it perhaps the warmest affections of the whole community, stands the Children's Aid Society. What heart does not feel the appeal of its very name? Who that sees the children, pale, thin, and sickly, lounging languidly in the shade of some hot brick building in the summer-time, or, in winter, ill clad, huddling together around a few blazing sticks in the street, while the dull twilight fades into night, is unwilling to reach out to them a helping hand? The

THE CHILDREN AT PLAY.

encouraged to live—in fact, were supported—in a state uniting shiftless luxury with abject squalor, while many an honest man, woman, and child, even, struggled hard to earn a decent living, and failed at last for want of a little well-merited aid. Nowadays charity is almost a science—at all events, it is a thing to be studied. Those who enter upon it thoughtlessly often do more harm than good. The man who stands ready, on impulse, to empty his purse, and the woman who is willing to fling open her larder, are not necessarily the benefactors of society. At present the charities which serve their purpose are well-ordered institutions, enjoying large incomes, employing energetic, intelligent, and efficient officers, and carrying on their work with the precision common to business transactions.

mother in her home, with her own happy girls and boys about her, would feel it a reproach to forget the little outcast. And the mother whose hearth is silent, whose little ones have gone to an early rest, not to be broken, under the sod and snow of Greenwood, feels that the care of suffering children to her is a sacred trust. The woman, too, whose life has never known the light of bright, laughing baby faces has still a heart for the joys and woes of tiny strangers. Children themselves—the thoughtful ones, at least—pausing from their play, remembering eager eyes they have seen peering over some area railing into a well-warmed, well-lighted basement, where an evening meal was preparing, or the longing looks which have followed them as they have driven away, in a carriage surmounted with

trunks, on a summer tour, ponder on the inequalities of life, and ask themselves if they ought not of their abundance to provide for those less blessed. And the father, coming home at Christmas time laden with toys for his own children, thinks gently of those who are fatherless. Even the grim, relentless old bachelor, who votes humanity a fraud,

summer of 1873. It was at that time more especially a sanitarium for very small children—those probably requiring the care of mother or nurse—and though it was then, as now, “a beautiful charity,” it was not altogether practically successful. At least it was susceptible of improvement, and the lady whose kindness of heart, intelligence,

GRAVESEND BEACH, BATH.

finds a husky tenderness creeping into his gruff voice as he mutters, “Poor little devil!” and buys from the frozen-fingered urchin a superfluous parcel of pencils, or the third-rate newspaper he has no intention of reading. And the stern, ambitious business man, who has risen by hard struggle from poverty to prominence, who believes that making money is the one great work of life, who, in his office, frowns a harsh “Begone!” on all intruders, relaxes his severity at the words, “From the Children’s Aid Society, Sir,” says, softly, “Ah, that is different,” takes the subscription book, and signs for a thousand dollars, making, perhaps unconsciously, his best investment for the day.

The work of the Children’s Aid Society, however, is too widely known to need either description or recommendation. This brief article proposes merely to treat of a new department which has recently been added to its labors—one so eminently a labor of love that all who hear of it, by common impulse, call it “a beautiful charity”—the Summer Home for Poor Children, at Bath, Long Island.

This institution was first established by Mrs. A. P. Stokes, on Staten Island, in the

and generosity originated this good work believed she could not do better for its permanent prosperity than place it in charge of the Children’s Aid Society. She accordingly suggested to the society that it should assume the supervision of the Home, and adopt it as a new department in its labors, expressing her readiness to assist in raising the funds necessary for its maintenance. The society agreed to accept the responsibility on condition that a sum of about \$4000 was collected. Mrs. Stokes and her husband gave \$1500, and the requisite amount was soon subscribed. The Children’s Aid Society is eminently practical in its manner of working. It did not wait for money to buy a tract of land and build a small hotel, while so many poor, neglected little city children were pining for a breath of country air. It entered upon its labors at once, continuing them upon the same ground where Mrs. Stokes had commenced. The same country-seat was rented, additions made to the furniture, three cows were bought, a garden laid out, and the whole establishment placed under the superintendence of Mr. and Mrs. John Gourley. After a time it seemed to the managers desirable that the Home should

THE GATE.

be so located that the children might enjoy frequent and safe sea-bathing. This led to an inspection of the shores of Long Island, and finally to the removal of the Poor Children's Summer Home to Bath.

In the spring of 1875, a house, formerly a private residence, with two and a half acres of ground about it, was rented, at the rate of \$600 per annum—just half the rental of the establishment on Staten Island. Its accommodations were enlarged by the refitting of the carriage-house as a dormitory. The Home is open from the early part of June till the middle of September. During that time, every Monday a party of children numbering about one hundred is taken to the Home, where they remain until the following Saturday. They receive an abundant supply of simple, nourishing food, are allowed to bathe daily, to take long walks, accompanied by some responsible person, and to remain in the open air as much as possible at play on the grounds. The children come chiefly from the industrial schools under the supervision of the Children's Aid Society; but other poor children are admitted, regardless of creed or nationality. Girls only, under seventeen years of age, are received, boys, excepting a very few of tiniest size and tenderest years, being excluded as too turbulent an element for a peaceful home. These, however, are recompensed in a measure for their self-inflicted penalty by a fine picnic toward the end of the season.

Sick children are not brought to the Home, as it is in no sense a hospital. Its object is rather to prevent than to cure sickness. Wan-faced, weary-limbed little urchins from the stifling tenement-houses of New York come to this place, and return to town with a new lease of life. The dull eyes become bright, the pale cheeks ruddy, and a happy memory of the beauties of nature, as well as a sweet consciousness of the tender friendliness of benevolent strangers, is carried back to illumine the dark walls of the city home. No case of illness or accident has occurred since the Home was opened. This establishment is at present under the superintendence of Mr. and Mrs. H. A. Holt, and the cheerful faces and pleasant tone prevailing in the little community reflect much credit on their management.

To those residents of New York who enjoy witnessing the working of such a charity, at the same time refreshing themselves with a breath of sea air, a very pleasant afternoon's trip is possible. The steamer *D. R. Martin* leaves pier No. 8, on the Hudson River, at a little after one o'clock. A delightful sail of about half an hour brings the passengers to Bay Ridge. Here a small locomotive, with an open car attached, awaits the landing of the boat. Those who propose visiting Bath betake themselves to the car, and soon find themselves flying along—most of the way between two earth embankments—at a pace which makes one think of that of a pair of runaway horses. Soon there is a halt for a change of cars. The second locomotive proceeds more sedately, carrying a heavier weight. The train glides along through a cheerful country, full of green fields and green trees, but making no claim to scenery. There is a slight pause at the meaningless village of New Utrecht, and then the train runs on, very shortly reaching Bath, which, at the first glance, might seem equally meaningless, but for the knowledge of the beautiful blue water immediately beyond the trees. A few inquiries, amiably answered by mine host of the hotel at the station, satisfy one as to the exact whereabouts of the Children's Summer Home. It is located on a pleasant country road running parallel with the shore, a little distance back from it. Here the residences, with their surrounding plots of ground, are situated between the road and the water. Not far from the Home, to the east of it, is a public garden belonging to a neighboring hotel. To the west are several attractive-looking country-seats, chief among them the "Villa Kathleen," of the late Mr. Barney Williams. A charming little girl, dressed in black and white, lingering in the gateway of the latter, does much to disarm the passer of any prejudice he might hold against "actor folks."

On leaving the Bath station, a very short walk to the westward brings one to the Children's Summer Home. Before the gate, with the inscription, "Summer Home, Children's Aid Society," above it, is reached, the merry hum of juvenile voices announces that it is near. Immediately inside of the gate is a broad straight path leading toward the house, which stands not far from the water. The path is shaded along its whole length, chiefly by fruit trees, and is edged on both sides with a border of bushy box, which seems the growth of many years. To the right and left are plots which may have been used as vegetable gardens. Closer to the house is the play-ground. Here the children spend the greater part of the day, and from this spot emanated the merry voices. On approaching, the object which first strikes the eye is a colony of swings, twenty-five in number, and not one empty. What is the charm in swinging? There these little ones go back and forth, from morning till night, twenty-five in the swings, and perhaps fifty more standing about in groups waiting patiently for a turn. Croquet is also played, and books and dolls somewhat patronized; but each of these requires a certain degree of skill or thought or sentiment for its enjoyment, which the exercise of swinging in no way exacts, and of all the pleasures of the land, swinging reigns supreme. But of the land only: in the water it has its triumphant rival. Let the hour of bathing be announced, and the play-ground is instantly deserted. The whole flock of children goes trooping around to the water-front. A select few—twenty or thirty—retire to the bathing-houses, and the rest range themselves along the brink of the little bluff above the beach. No company of star actors ever had a more rapt audience. There is an ill-suppressed squeal of delight when the bell rings, the doors of the bathing-houses fly open, and a little regiment of striped gowns goes prancing down the wooden steps to the water. And what a merry shout in response comes up as the bathers plunge into the waves! Why do people scream when bathing? Has any one ever found out? Yet scream they will; and it sounds so cheery, who would tell them to stop? Here and there is a girl who swims finely. There are no breakers along this part of the shore; the waves ripple in gently; the opportunity for swimming is excellent—tempting even to others besides the children. A little apart from the juvenile audience stands a middle-aged gentleman, of energetic, intelligent, and kindly countenance. Suddenly he disappears in the direction of the bathing-houses, soon reappearing clad in a blue flannel costume. "Oh! oh! oh! there's Mr. B——!" shout the children on the shore, enthusiastically. A

welcome of equal warmth greets him from the children in the water. The gentleman's name is so widely known that we trust he will pardon our introducing him to the public in his bathing suit. He enters the water as eagerly as any of the children, and apparently enjoys the swimming exceedingly. But not selfishly. After a few independent strokes, he undertakes to teach one of the little girls to swim. She places one hand on his shoulder, and is beginning to strike out with the other—but the lesson is interrupted. The bell rings, and the children, with dripping hair and dripping garments, reluctantly leave the water and make their way up the wooden steps to the bathing-houses. A little girl from the audience springs up and attacks Mrs. Holt with an earnest, "Oh, teacher, mayn't some of us take the wet suits and go in now?" But Mrs. Holt does not approve this brilliant suggestion. The day is cool; she has allowed to go in only those who are strong and accustomed to bathing, and the little girl in question has a cold, and ought not to go in at all. There is a look of disappointment, but no rebellion. Considering that human nature is human, the children are remarkably obedient; and considering that there are a hundred of them to do the shouting and laughing, they make wonderfully little noise. There are very few rules for their government, scarcely any beyond the strict prohibition of eating green fruit, wandering away from the grounds, and bathing without permission. It was the inability on the boys' part to obey these regulations which banished them from this temporary Eden. The children rise and retire early, spending the greater part of the day out-of-doors. The majority are little girls from eight to twelve years old. Occasionally a small boy, aged two or four, is seen, under the care of an elder sister. It is amusing to watch the groups—odd to notice, with the many differences, certain pervading traits. For example: the day is both sunny and windy, and yet, at the first glance, not a hat is to be seen. Hair of every shade of yellow, red, brown, and black is tossed in the breeze, not to the discomfort but to the apparent enjoyment of its owner. On careful examination, two hats are discovered; one is on the head of a little boy—it looks as if it grew there, and he had slept in it half his life; the other, on a consequential-looking little maiden, apparently is purely ornamental, being of a brightness and newness which puts all its surroundings in the shade. The other children all have hats, but they are hanging in rows above the beds in the dormitories.

Turning from the water to the house, the question arises in the mind, Where are all these little ones stowed away at night? The home is a pleasant-looking country-house,

but none too large for a moderate-sized private family. The problem is in some degree solved when, on entering, the large room which once must have served as best parlor is seen to contain one dozen iron bedsteads, most of them double, and several wash-stand bureaus. On each bureau is a tin wash-basin and a strong china pitcher; the beds all have white quilts; the general aspect is very neat. There are six windows to the room, all arranged to open at the top, so that the ventilation is abundant. In the story above—there are but two stories to the house—are two or three more rooms,

is an addition on the east side of the house. It is a square room, with several windows, and doors opening into the garden back and front. A meditative-looking hen perched on the steps gives it a rural aspect. There are three long, narrow tables in the room, with long benches at each side. Each child is provided with a strong china plate and a large mug. There is plenty of milk, bread, butter, oatmeal, and grits for all. A dinner bill of fare is arranged for the week—Monday, pork and beans; Tuesday, stewed beef and onions (very popular); Wednesday, mutton; Thursday, roast beef; Friday, fish; Sat-

DINNER.

each containing several beds. Then there is the carriage-house, which was refitted to form three dormitories, one containing about twenty beds, the others somewhat smaller. It is not to be supposed that from the "home, sweet home" stand-point of the wealthy or fastidious, these apartments would appear attractive. But when it is considered what the children are accustomed to in their own homes, and what the real requirements of the case are, the accommodations are excellent—indeed, far more excellent in their simplicity than they would be if they were more elaborate. It is not said that, in a new building, they could not be made better; merely that the best is being done with the material at hand. After examining the dormitories, it is not uninteresting to glance into the dining-room. This

urday, something or other. A simple and healthful dessert is supplied each day except Thursday—roast beef being considered a luxury which renders dessert quite superfluous. Fruit and vegetables are also provided. Dinner is in the middle of the day, breakfast early, and supper at about six.

On leaving the dining-room, it seems only natural to pause a few moments in the parlor. It is a pleasant little apartment, ornamented most by the cheerful sunshine which streams in at the windows, and the beautiful view beyond of deep blue water stretching away to the horizon, with a glimpse of the white sand beach of Coney Island to the east, and the hills of Richmond County rising in the west. The mantel-shelf is covered from end to end with a row of well-used, brightly bound children's story-books. On

the table is a photograph of the Home, with a hundred children grouped in the foreground. Near the photograph is a small book, a sort of "Home Journal," filled with incidents and anecdotes concerning the children. It also contains copies of some of the letters which they from time to time have felt inspired to write. As is usual with children's compositions, some of them are unintentionally somewhat comical. But it would hardly be fair to close this sketch of the Home without finding space for their frankly expressed views on the subject, so two of the epistles are appended—one, a familiar home letter; the other, a document of more formal stamp. The first is as follows:

"CHILDREN'S SEA-SIDE HOME, BATH, August 22, 1876.

"DEAR MAMMA, PAPA, SISTER, AND BROTHER,—I arrived safe; it is a beautiful place. I went in bathing, and had a splendid time. The people are all very kind to us. I couldn't begin to tell you how nice it is.

"Yours, affectionately,
"____"

The second:

"CHILDREN'S SEA-SIDE HOME,
BATH, LONG ISLAND, August 24, 1876.

"Mrs. A. P. Stokes:

"DEAR FRIEND,—We children who have been staying at the Summer Home this week have heard that you first started the Home.

"There are about ninety-two children up this week, and they liked it very much indeed. There are plenty of swings, and the bathing is splendid. The children like to go in bathing, and bother the teachers till they can go.

"We take a walk in the morning after breakfast, or in the evening after supper. The teachers went with

us to take a walk yesterday; we walked up the road a long way, and asked them to take us to the Fort,* and they did so, and we went in, and sang the 'Battle Song.' When we were going home we wanted to walk along the beach, but we could not, because there was a space of water that we could not get across, and we had to go home by the road.

"We thank you very much for keeping such a pleasant Home for the children; we hope you will remain our best friend.

"The children all love you, and send their best respects. Yours, respectfully."

Signed by all the children present at that date at the Home.

Such is the verdict of the children—and it must be very gratifying to those who have given their thought, time, and money to this beautiful charity.

The Home, it is expected, will re-open every summer for three months, or longer, if circumstances permit. The institution is supported by subscription, independent of the Children's Aid Society's regular funds. It is estimated that the expenses are about forty-five cents a day for each child. How little that seems to give for the amount of benefit reaped! As a sanitary measure, the establishment of such homes in connection with our large cities can not be too highly valued. Several similar homes have been founded recently. There can not be too many. Their usefulness is undoubted, and the form of charity is one which appeals strongly to all who have at heart the health and happiness of the community.

A WOMAN-HATER.

CHAPTER XXVII.

"YOU infernal scoundrel!" roared Vizard, and took a stride toward Severne.

"No violence," said Ina Klosking, sternly: "it will be an insult to this lady and me."

"Very well, then," said Vizard, grimly; "I must wait till I catch him alone."

"Meantime permit me to speak, Sir," said Ina. "Believe me, I have a better right than even you."

"Then pray ask my sister why I find her on that villain's arm."

"I should not answer her," said Zoe, haughtily. "But my brother I will. Harrington, all this vulgar abuse confirms me in my choice: I take his arm because I have accepted his hand. I am going into Bagley with him to become his wife."

This announcement took away Vizard's breath for a moment, and Ina Klosking put in her word. "You can not do that: pray be warned. He is leading you to infamy."

"Infamy! What! because he can not give me a suit of sables? Infamy! because we prefer virtuous poverty to vice and wealth?"

"No, young lady," said Ina, coloring faint-

ly at the taunt; "but because you could only be his paramour, not his wife. He is married already."

At these words, spoken with that power Ina Klosking could always command, Zoe Vizard turned ashy pale. But she fought on bravely. "Married? It is false! To whom?"

"To me."

"I thought so. Now I know it is not true. He left you months before we ever knew him."

"Look at him. He does not say it is false."

Zoe turned on Severne, and at his face her own heart quaked. "Are you married to this lady?" she asked; and her eyes, dilated to their full size, searched his every feature.

"Not that I know of," said he, impudently.

"Is that the serious answer you expected, Miss Vizard?" said Ina, keenly. Then to Severne, "You are unwise to insult the woman on whom, from this day, you must depend for bread. Miss Vizard, to you I speak, and not to this shameless man. For your

* Fort Hamilton.

mother's sake, do me justice. I have loved him dearly, but now I abhor him. Would I could break the tie that binds us, and give him to you, or to any lady who would have him! But I can not. And shall I hold my tongue, and let you be ruined and dishonored? I am an older woman than you, and bound by gratitude to all your house. Dear lady, I have taxed my strength to save you. I feel that strength waning. Pray read this paper, and consent to save *yourself*."

"I will read it," said Rhoda Gale, interfering. "I know German. It is an authorized duplicate certifying the marriage of Edward Severne, of Willingham, in Huntingdonshire, England, to Ina Ferris, daughter of Walter Ferris and Eva Klosking, of Zutzig, in Denmark. The marriage was solemnized at Berlin, and here are the signatures of several witnesses: Eva Klosking; Fräulein Graafe; Züig, the Cappellmeister; Vicomte Meurice, French *attaché*; Count Hompesch, Bavarian plenipotentiary; Herr Formes."

Ina explained, in a voice that was now feeble, "I was a public character; my marriage was public: not like the clandestine union which is all he dared offer to this well-born lady."

"The Bavarian and French ministers are both in London," said Vizard, eagerly. "We can easily learn if these signatures are forged, like *your* acceptances."

But if one shadow of doubt remained, Severne now removed it: he uttered a scream of agony, and fled as if the demons of remorse and despair were spurring him with red-hot rowels.

"There, you little idiot," roared Vizard; "does that open your eyes?"

"Oh, Mr. Vizard," said Ina, reproachfully, "for pity's sake, think only of her youth, and what she has to suffer. I can do no more for her: I feel—so—faint."

Ashmead and Rhoda supported her into the carriage. Vizard, touched to the heart by Ina's appeal, held out his eloquent arms to his stricken sister, and she tottered to him, and clung to him, all limp and broken, and wishing she could sink out of the sight of all mankind. He put his strong arm round her, and, though his own heart was desolate and broken, he supported that broken flower of womanhood, and half led, half lifted her on, until he laid her on a sofa in Somerville Villa. Then, for the first time, he spoke to her. "We are both desolate now, my child. Let us love one another. I will be ten times tenderer to you than I ever have been." She gave a great sob, but she was past speaking.

Ina Klosking, Miss Gale, and Ashmead returned in the carriage to Bagley. Half a mile out of the town they found a man lying on the pathway, with his hat off, and

white as a sheet. It was Edward Severne. He had run till he dropped.

Ashmead got down and examined him.

He came back to the carriage door, looking white enough himself. "It is all over," said he; "the man is dead."

Miss Gale was out in a moment, and examined him. "No," said she. "The heart does not beat perceptibly, but he breathes. It is another of those seizures. Help me get him into the carriage."

This was done, and the driver ordered to go a foot's pace.

The stimulants Miss Gale had brought for Ina Klosking were now applied to revive this malefactor: and both ladies actually ministered to him with compassionate faces. He was a villain; but he was superlatively handsome, and a feather might turn the scale of life or death.

The seizure, though really appalling to look at, did not last long. He revived a little in the carriage, and was taken, still insensible, but breathing hard, into a room in the railway hotel. When he was out of danger, Miss Gale felt Ina Klosking's pulse, and insisted on her going to Taddington by the next train, and leaving Severne to the care of Mr. Ashmead.

Ina, who, in truth, was just then most unfit for any more trials, feebly consented, but not until she had given Ashmead some important instructions respecting her malefactor, and supplied him with funds. Miss Gale also instructed Ashmead how to proceed in case of a relapse, and provided him with materials.

The ladies took a train which arrived soon after; and, being so fortunate as to get a lady's carriage all to themselves, they sat intertwined and rocking together, and Ina Klosking found relief at last in a copious flow of tears.

Rhoda got her to Hillstoke, cooked for her, nursed her, lighted fires, aired her bed, and these two friends slept together in each other's arms.

Ashmead had a hard time of it with Severne. He managed pretty well with him at first, because he stupefied him with brandy before he had come to his senses, and in that state got him into the next train. But as the fumes wore off, and Severne realized his villainy, his defeat, and his abject condition between the two women he had wronged, he suddenly uttered a yell, and made a spring at the window. Ashmead caught him by his calves, and dragged him so powerfully down that his face struck the floor hard, and his nose bled profusely. The hemorrhage and the blow quieted him for a time, and then Ashmead gave him more brandy, and got him to the "Swan" in a half-lethargic lull. This faithful agent and man-of-all-work took a private sitting-room with a double-bedded room adjoining it, and

ordered a hot supper, with Champagne and Madeira.

Severne lay on a sofa, moaning.

The waiter stared. "Trouble!" whispered Ashmead, confidentially. "Take no notice. Supper as quick as possible."

By-and-by Severne started up, and began to rave and tear about the room, cursing his hard fate, and ended in a kind of hysterical fit. Ashmead, being provided by Miss Gale with salts and aromatic vinegar, etc., applied them, and ended by dashing a tumbler of water right into his face, which did him more good than chemistry.

Then he tried to awaken manhood in the fellow. "What are *you* howling about?" said he. "Why, you are the only sinner, and you are the least sufferer. Come, drop sniveling, and eat a bit. Trouble don't do on an empty stomach."

Severne said he would try, but begged the waiter might not be allowed to stare at a broken-hearted man.

"Broken fiddle-stick!" said honest Joe.

Severne tried to eat, but could not. But he could drink, and said so.

Ashmead gave him Champagne in tumblers, and that, on his empty stomach, set him raving, and saying life was hell to him now. But presently he fell to weeping bitterly. In which condition Ashmead forced him to bed, and there he slept heavily. In the morning Ashmead sat by his bedside, and tried to bring him to reason. "Now look here," said he: "you are a lucky fellow, if you will only see it. You have escaped bigamy and a jail, and as a reward for your good conduct to your wife, and the many virtues you have exhibited in a short space of time, I am instructed by that lady to pay you twenty pounds every Saturday at twelve o'clock. It is only a thousand a year; but don't you be down-hearted; I conclude she will raise your salary as you advance. You must forge her name to a heavy check, rob a church, and abduct a school-girl or two—misses in their teens and wards of Chancery preferred—and she will make it thirty, no doubt;" and Joe looked very sour.

"That for her twenty pounds a week!" cried this injured man. "She owes me two thousand pounds and more. She has been my enemy and her own. The fool!—to go and peach! She had only to hold her tongue, and be Mrs. Vizard, and then she would have had a rich husband that adores her, and I should have had my darling, beautiful Zoe, the only woman I ever loved or ever shall."

"Oh," said Ashmead, "then you expected your wife to commit bigamy, and so make it smooth to you?"

"Of course *I did*," was the worthy Severne's reply; "and so she would, if she had had a grain of sense. See what a contrast now! We are all unhappy—herself included—and it is all her doing."

"Well, young man," said Ashmead, drawing a long breath, "didn't I tell you, you are a lucky fellow? You have got twenty pounds a week, and that blessed boon, 'a conscience void of offense.' You are a happy man. Here's a strong cup of tea for you: just you drink it, and then get up and take the train to the little village. There kindred spirits and fresh delights await you. You are not to adorn Barfordshire any longer; that is the order."

"Well, I'll go to London—but not without you."

"Me! What do you want of *me*?"

"You are a good fellow, and the only friend I have left. But for you I should be dead or mad. You have pulled me through."

"Through the window I did. Lord forgive me for it," said Joseph. "Well, I'll go up to town with you; but I can't be always tied to your tail. I haven't got twenty pounds a week. To be sure," he added, dryly, "I haven't earned it. That is one comfort."

He telegraphed to Hillstoke, and took Severne up to London.

There the Bohemian very soon found he could live, and even derive some little enjoyment—from his vices—without Joseph Ashmead. He visited him punctually every Saturday, and conversed delightfully. If he came any other day, it was sure to be for an advance: he never got it.

CHAPTER XXVIII.

FANNY DOVER was sent for directly to Somerville Villa; and three days after the distressing scene I have endeavored to describe, Vizard brought his wrecked sister home. Her condition was pitiable; and the moment he reached Vizard Court he mounted his horse and rode to Hillstoke to bring Miss Gale down to her.

There he found Ina Klosking, with her boxes at the door, waiting for the fly that was to take her away.

It was a sad interview. He thanked her deeply for her noble conduct to his sister, and then he could not help speaking of his own disappointment.

Mademoiselle Klosking, on this occasion, was simple, sad, and even tender, within prudent limits. She treated this as a parting forever, and therefore made no secret of her esteem for him. "But," said she, "I hope one day to hear you have found a partner worthy of you. As for me, who am tied for life to one I despise, and can never love again, I shall seek my consolation in music, and, please God, in charitable actions."

He kissed her hand at parting, and gave her a long, long look of miserable regret

that tried her composure hard, and often recurred to her memory.

She went up to London, took a small suburban house, led a secluded life, and devoted herself to her art, making a particular study now of sacred music; she collected volumes of it, and did not disdain to buy it at book-stalls or wherever she could find it.

Ashmead worked for her, and she made her first appearance in a new oratorio. Her songs proved a principal feature in the performance.

Events did not stand still in Barfordshire; but they were tame compared with those I have lately related, and must be dispatched in fewer words.

Aunt Maitland recovered unexpectedly from a severe illness, and was a softened woman: she sent Fanny off to keep Zoe company. That poor girl had a bitter time, and gave Doctress Gale great anxiety. She had no brain-fever, but seemed quietly, insensibly sinking into her grave. No appetite, and, indeed, was threatened with atrophy at one time. But she was so surrounded with loving-kindness that her shame diminished, her pride rose, and at last her agony was blunted, and only a pensive languor remained to show that she had been crushed, and could not be again the bright, proud, high-spirited beauty of Barfordshire.

For many months she never mentioned either Edward Severne, Ina Klosking, or Lord Uxmoor.

It was a long time before she went outside the gates of her own park. She seemed to hate the outer world.

Her first visit was to Miss Gale. That young lady was now very happy. She had her mother with her. Mrs. Gale had defeated the tricky executor, and had come to England with a tidy little capital, saved out of the fire by her sagacity and spirit.

Mrs. Gale's character has been partly revealed by her daughter. I have only to add, she was a homely, well-read woman, of few words, but those few—grape-shot. Example—she said to Zoe: "Young lady, excuse an old woman's freedom, who might be your mother. The troubles of young folk have a deal of self in them; more than you could believe. Now just you try something to take you out of self, and you will be another creature."

"Ah," sighed Zoe, "would to Heaven I could!"

"Oh," said Mrs. Gale, "any body with money can do it, and the world so full of real trouble. Now my girl tells me you are kind to the poor: why not do something like Rhoda is doing for this lord she is over-seer, or goodness knows what, to?"

RHODA (*defiantly*). "Viceroy."

"You have money, and your brother will not refuse you a bit o' land. Why not build

some of these new-fangled cottages, with fancy gardens, and dwarf palaces for a cow and a pig? Rhoda, child, if I was a poor woman, I could graze a cow in the lanes hereabouts and feed a pig in the woods. Now you do that for the poor, Miss Vizard, and don't let my girl think for you. Breed your own ideas. That will divert you from self, my dear, and you will begin to find it—there—just as if a black cloud was clearing away from your mind, and letting your heart warm again."

Zoe caught at the idea, and that very day asked Vizard, timidly, whether he would let her have some land to build a model cottage or two on.

Will it be believed that the good-natured Vizard made a wry face? "What, two proprietors in Islip!" For a moment or two he was all squire. But soon the brother conquered. "Well," said he, "I can't give you a fee-simple; I must think of my heirs: but I will hold a court, and grant you a copyhold, or I'll give you a ninety-nine years' lease at a pepper-corn. There's a slip of three acres on the edge of the Green; you shall amuse yourself with that." He made it over to her directly for a century, at ten shillings a year; and as he was her surviving trustee, he let her draw in advance on her ten thousand pounds.

Mapping out the ground with Rhoda, settling the gardens and the miniature pastures, and planning the little houses and out-houses, and talking a great deal, compared with what she transacted, proved really a certain antidote to that lethargy of woe which oppressed her. And here for a time I must leave her, returning slowly to health of body and some tranquillity of mind, but still subject to fits of shame, and gnawed by bitter regrets.

CHAPTER XXIX.

THE reputation Mademoiselle Klosking gained in the new oratorio, aided by Ashmead's exertions, launched her in a walk of art that accorded with her sentiments.

She sang in the oratorio whenever it could be performed, and also sang select songs from it, and other sacred songs at concerts.

She was engaged at a musical festival in the very cathedral town whose choir had been so consoling to her. She entered with great zeal into this engagement; and finding there was a general desire to introduce the leading chorister boy to the public in a duet, she surprised them all by offering to sing the second part with him if he would rehearse it carefully with her at her lodgings. He was only too glad, as might be supposed. She found he had a lovely voice, but little physical culture. He read cor-

rectly, but did not even know the nature of the vocal instrument and its construction, which is that of a Bagpipe. She taught him how to keep his lungs full in singing, yet not to gasp, and by this simple means enabled him to sing with more than twice the power he had ever exercised yet. She also taught him the swell—a figure of music he knew literally nothing about.

When, after singing a great solo, to salvos of applause, Mademoiselle Klosking took the second part with this urchin, the citizens and all the musical people who haunt a cathedral were on the tiptoe of expectation. The boy amazed them, and the rich contralto that supported him, and rose and swelled with him in ravishing harmony, enchanted them. The vast improvement in the boy's style did not escape the hundreds of persons who knew him, and this duet gave la Klosking a great personal popularity.

Her last song, by her own choice, was, "What though I trace" (Handel), and the majestic volume that rang through the echoing vault showed with what a generous spirit she had subdued that magnificent organ not to crush her juvenile partner in the preceding duet.

Among the persons present was Harrington Vizard. He had come there against his judgment, but he could not help it.

He had been cultivating a dull tranquillity, and was even beginning his old game of railing on women as the great disturbers of male peace. At the sight of her, and the sound of her first notes, away went his tranquillity, and he loved her as ardently as ever. But when she sang his mother's favorite, and the very roof rang, and three thousand souls were thrilled and lifted to heaven by that pure and noble strain, the rapture could not pass away from this one heart; while the ear ached at the cessation of her voice, the heart also ached and pined and yearned.

He ceased to resist. From that day he followed her about to her public performances all over the Midland Counties; and she soon became aware of his presence. She said nothing till Ashmead drew her attention; then, being compelled to notice it, she said it was a great pity. Surely he must have more important duties at home.

Ashmead wanted to recognize him, and put him into the best place vacant; but la Klosking said, "No. I will be more his friend than to lend him the least encouragement."

At the end of that tour she returned to London.

While she was there in her little suburban house, she received a visit from Mr. Edward Severne. He came to throw himself at her feet and beg forgiveness. She said she would try and forgive him. He then im-

plored her to forget the past. She told him that was beyond her power. He persisted, and told her he had come to his senses; all his misconduct now seemed a hideous dream, and he found he had never really loved any one but her. So then he entreated her to try him once more; to give him back the treasure of her love.

She listened to him like a woman of marble. "Love where I despise!" said she. "Never. The day has gone by when these words can move me. Come to me for the means of enjoying yourself—gambling, drinking, and your other vices—and I shall indulge you. But do not profane the name of love. I forbid you ever to enter my door on that errand. I presume you want money. There is a hundred pounds. Take it, and keep out of my sight till you have wasted it."

He dashed the notes proudly down. She turned her back on him, and glided into another room.

When she returned, he was gone, and the hundred pounds had managed to accompany him.

He went straight from her to Ashmead, and talked big. He would sue for restitution of conjugal rights.

"Don't do that, for my sake," said Ashmead. "She will fly the country like a bird, and live in some village on bread and milk."

"Oh, I would not do *you* an ill turn for the world," said the master of arts. "You have been a kind friend to me. You saved my life. It is imbittered by remorse, and recollections of the happiness I have thrown away and the heart I have wronged. No matter!"

This visit disturbed la Klosking, and disposed her to leave London. She listened to a brilliant offer that was made her, through Ashmead, by the manager of the Italian Opera, who was organizing a provincial tour. The tour was well advertised in advance, and the company opened to a grand house at Birmingham.

Mademoiselle Klosking had not been long on the stage when she discovered her discarded husband in the stalls, looking the perfection of youthful beauty. The next minute she saw Vizard in a private box. Mr. Severne applauded her loudly, and flung her a bouquet. Mr. Vizard fixed his eyes on her, beaming with admiration, but made no public demonstration.

The same incident repeated itself every night she sang, and at every town.

At last she spoke about it to Ashmead, in the vague, suggestive way her sex excels in. "I presume you have observed the people in front."

"Yes, madam. Two in particular."

"Could you not advise him to desist?"

"Which of 'em, madam?"

"Mr. Vizard, of course. He is losing his time, and wasting sentiments it is cruel should be wasted."

Ashmead said he dared not take any liberty with Mr. Vizard.

So the thing went on.

Severne made acquaintance with the manager, and obtained the *entrée* behind the scenes. He brought his wife a bouquet every night, and presented it to her with such reverence and grace that she was obliged to take it and courtesy, or seem rude to the people about.

Then she wrote to Miss Gale, and begged her to come if she could.

Miss Gale, who had all this time been writing her love-letters twice a week, immediately appointed her mother viceroy, and went to her friend. Ina Klosking explained the situation to her with a certain slight timidity and confusion not usual to her, and said, "Now, dear, you have more courage than the rest of us; and I know he has a great respect for you; and, indeed, Miss Dover told me he would quite obey you. Would it not be the act of a friend to advise him to cease this unhappy—What good can come of it? He neglects his own duties, and disturbs me in mine. I sometimes ask myself would it not be kinder of me to give up my business, or practice it elsewhere—Germany, or even Italy."

"Does he call on you?"

"No."

"Does he write to you?"

"Oh no. I wish he would. Because then I should be able to reply like a true friend, and send him away. Consider, dear, it is not like a nobody dangling after a public singer; that is common enough. We are all run after by idle men; even Signorina Zubbetta, who has not much voice nor appearance, and speaks a Genoese *patois* when she is not delivering a libretto. But for a gentleman of position, with a heart of gold and the soul of an emperor, that he should waste his time and his feelings so, on a woman who can never be any thing to him, it is pitiable."

"Well, but, after all, it is his business; and he is not a child: besides, remember he is really very fond of music. If I were you, I'd look another way, and take no notice."

"But I can not."

"Ah!—and why not, pray?"

"Because he always takes a box on my left hand, two from the stage. I can't think how he gets it at all the theatres. And then he fixes his eyes on me so, I can not help stealing a look. He never applauds nor throws me bouquets. He looks—oh, you can not conceive how he looks, and the strange effect it is beginning to produce on me."

"He mesmerizes you?"

"I know not. But it is a growing fasci-

nation. Oh, my dear physician, interfere! If it goes on, we shall be more wretched than ever." Then she enveloped Rhoda in her arms, and rested a hot cheek against hers.

"I see," said Rhoda. "You are afraid he will make you love him."

"I hope not. But artists are impressionable; and being looked at so, by one I esteem, night after night when my nerves are strung—*cela m'agace*;" and she gave a shiver, and then was a little hysterical; and that was very unlike her.

Rhoda kissed her, and said, resolutely, she would stop it.

"Not unkindly?"

"Oh no."

"You will not tell him it is offensive to me?"

"No."

"Pray do not give him unnecessary pain."

"No."

"He is not to be mortified."

"No."

"I shall miss him sadly."

"Shall you?"

"Naturally. Especially at each new place. Only conceive: one is always anxious on the stage; and it is one thing to come before a public all strangers, and nearly all poor judges; it is another to see, all ready for your first note, a noble face bright with intelligence and admiration—the face of a friend. Often that one face is the only one I allow myself to see. It hides the whole public."

"Then don't you be silly and send it away. I'll tell you the one fault of your character: you think too much of other people, and too little of yourself. Now that is contrary to the scheme of nature. We are sent into the world to take care of number one."

"What?" said Ina; "are we to be all self-indulgence? Is there to be no principle, no womanly prudence, foresight, discretion? No; I feel the sacrifice; but no power shall hinder me from making it. If you can not persuade him, I'll do like other singers. I will be ill, and quit the company."

"Don't do that," said Rhoda. "Now you have put on your iron look, it is no use arguing—I know that to my cost. There! I will talk to him. Only don't hurry me; let me take my opportunity."

This being understood, Ina would not part with her for the present, but took her to the theatre. She dismissed her dresser, at Rhoda's request, and Rhoda filled that office. So they could talk freely.

Rhoda had never been behind the scenes of a theatre before, and she went prying about, ignoring the music, for she was almost earless. Presently, whom should she encounter but Edward Severne. She started, and looked at him like a basilisk. Ho

removed his hat, and drew back a step with a great air of respect and humility. She was shocked and indignant with Ina for letting him be about her. She followed her off the stage into her dressing-room, and took her to task. "I have seen Mr. Severne here."

"He comes every night."

"And you allow him?"

"It is the manager."

"But he would not admit him if you objected."

"I am afraid to do that."

"Why?"

"We should have an *esclandre*. I find he has had so much consideration for me as to tell no one our relation; and as he has never spoken to me, I do the most prudent thing I can, and take no notice. Should he attempt to intrude himself on me, then it will be time to have him stopped in the hall, and I shall do it *coûte que coûte*. Ah, my dear friend, mine is a difficult and trying position."

After a very long wait, Ina went down and sang her principal song, with the usual bravas and thunders of applause. She was called on twice, and as she retired, Severne stepped forward; and, with a low, obsequious bow, handed her a beautiful bouquet. She took it with a stately courtesy, but never looked nor smiled. Rhoda saw that, and wondered. She thought to herself, "That is carrying politeness a long way. To be sure, she is half a foreigner."

Having done his nightly homage, Severne left the theatre, and soon afterward the performance concluded, and Ina took her friend home.

Ashmead was in the hall to show his patroness to her carriage—a duty he never failed in. Rhoda shook hands with him, and he said, "Delighted to see you here, miss. You will be a great comfort to her."

The two friends communed till two o'clock in the morning; but the limits of my tale forbid me to repeat what passed. Suffice it to say that Rhoda was fairly puzzled by the situation; but, having a great regard for Vizard, saw clearly enough that he ought to be sent back to Islip. She thought that perhaps the very sight of her would wound his pride, and, finding his mania discovered by a third person, he would go of his own accord: so she called on him.

My lord received her with friendly composure, and all his talk was about Islip. He did not condescend to explain his presence at Carlisle. He knew that *qui s'excuse s'accuse*, and left her to remonstrate. She had hardly courage for that, and hoped it might be unnecessary.

She told Ina what she had done. But her visit was futile: at night there was Vizard in his box.

Next day the company opened in Man-

chester. Vizard was in his box there—Severne in front, till Ina's principal song. Then he came round and presented his bouquet. But this time he came up to Rhoda Gale, and asked her whether a penitent man might pay his respects to her in the morning.

She said she believed there were very few penitents in the world.

"I know one," said he.

"Well, I don't, then," said the virago. "But *you* can come, if you are not afraid."

Of course Ina Klosking knew of this appointment two minutes after it was made. She merely said, "Do not let him talk you over."

"He is not so likely to talk me over as you," said Rhoda.

"You are mistaken," was Ina's reply. "I am the one person he will never deceive again."

Rhoda Gale received his visit; he did not beat about the bush nor fence at all. He declared at once what he came for. He said, "At the first sight of you, whom I have been so ungrateful to, I could not speak; but now I throw myself on your forgiveness. I think you must have seen that my ingratitude has never sat light on me."

"I have seen that you were terribly afraid of me," said she.

"I dare say I was. But I am not afraid of you now; and here, on my knees, I implore you to forgive my baseness, my ingratitude. Oh, Miss Gale, you don't know what it is to be madly in love; one has no principle, no right feeling, against a real passion: and I was madly in love with her. It was through fear of losing her I disowned my physician, my benefactress, who had saved my life. Miserable wretch! It was through fear of losing her that I behaved like a ruffian to my angel wife, and would have committed bigamy, and been a felon. What was all this but madness? You, who are so wise, will you not forgive me a crime that downright insanity was the cause of?"

"Humph! if I understand right, you wish me to forgive you for looking in my face, and saying to the woman who had saved your life, 'I don't know you?'"

"Yes—if you can. No: now you put it in plain words, I see it is not to be forgiven."

"You are mistaken. It was like a stab to my heart, and I cried bitterly over it."

"Then I deserve to be hanged; that is all."

"But, on consideration, I believe it is as much your nature to be wicked as it is my angel Ina's to be good. So I forgive you that one thing, you charming villain." She held out her hand to him in proof of her good faith.

He threw himself on his knees directly, and kissed and mumbled her hand, and bedewed it with hysterical tears.

"Oh, don't do that," said she; "or I'm bound to give you a good kick. I hate she-men."

"Give me a moment," said he, "and I will be a man again."

He sat with his face in his hands, gulping a little.

"Come," said she, cocking her head like a keen jackdaw; "now let us have the real object of your visit."

"No, no," said he, inadvertently—"another time will do for that. I am content with your forgiveness. Now I can wait."

"What for?"

"Can you ask? Do you consider this a happy state of things?"

"Certainly not. But it can't be helped: and we have to thank you for it."

"It could be helped in time. If you would persuade her to take the first step."

"What step?"

"Not to disown her husband. To let him at least be her friend—her penitent, humble friend. We *are* man and wife. If I were to say so publicly, she would admit it. In this respect at least I have been generous: will she not be generous too? What harm could it do her if we lived under the same roof, and I took her to the theatre and fetched her home, and did little friendly offices for her?"

"And so got the thin edge of the wedge in, eh? Mr. Severne, I decline all interference in a matter so delicate, and in favor of a person who would use her as ill as ever, if he once succeeded in recovering her affections."

So then she dismissed him peremptorily.

But, true to Vizard's interest, she called on him again, and, after a few preliminaries, let him know that Severne was every night behind the scenes.

A spasm crossed his face. "I am quite aware of that," said he. "But he is never admitted into her house."

"How do you know?"

"He is under constant surveillance."

"Spies?"

"No. Thief-takers. All from Scotland Yard."

"And love brings men down to this. What is it for?"

"When I am sure of your co-operation, I will let you know my hopes."

"He doubts my friendship," said Rhoda, sorrowfully.

"No; only your discretion."

"I will be discreet."

"Well, then, sooner or later he is sure to form some improper connection or other; and then I hope you will aid me in persuading her to divorce him."

"That is not so easy in this country. It is not like our Western States, where, the saying is, they give you five minutes at a railway station for di—vorce."

"You forget she is a German Protestant, and the marriage was in that country. It will be easy enough."

"Very well; dismiss it from your mind. She will never come before the public in that way. Nothing you nor I could urge would induce her."

Vizard replied, doggedly, "I will never despair so long as she keeps him out of her house."

Rhoda told Ina Klosking this, and said, "Now it is in your own hands. You have only to let your charming villain into your house, and Mr. Vizard will return to Islip."

Ina Klosking buried her face in her hands, and thought.

At night, Vizard in his box, as usual. Severne behind the scenes with his bouquet. But this night he staid for the ballet, to see a French danseuse who had joined them. He was acquainted with her before, and had a sprightly conversation with her. In other words, he renewed an old flirtation.

The next opera night all went as usual. Vizard in the box, looking sadder than usual. Rhoda's good sense had not been entirely wasted. Severne, with his bouquet, and his grave humility, until the play ended, and la Klosking passed out into the hall. Her back was hardly turned, when Mademoiselle Lafontaine, dressed for the ballet, in a most spicy costume, danced up to her old friend, and slapped his face very softly with a rose, then sprang away, and stood on her defense.

"I'll have that rose," cried Severne.

"Nenni."

"And a kiss into the bargain."

"Jamais."

"C'est ce que nous verrons."

He chased her. She uttered a feigned "Ah!" and darted away. He followed her; she crossed the scene at the back, where it was dark, bounded over an open trap, which she saw just in time; but Severne, not seeing it, because she was between him and it, fell through it, and striking the mazarine, fell into the cellar, fifteen feet below the stage.

The screams of the dancer soon brought a crowd round the trap, and reached Mademoiselle Klosking just as she was going out to her carriage. "There!" she cried. "Another accident!" and she came back, making sure it was some poor carpenter come to grief, as usual. On such occasions her purse was always ready.

They brought Severne up sensible, but moaning, and bleeding at the temple, and looking all streaky about the face.

They were going to take him to the infirmary; but Mademoiselle Klosking, with a face of angelic pity, said, "No; he bleeds, he bleeds. He must go to my house."

They stared a little; but it takes a good deal to astonish people in a theatre.

Severne was carried out; his head hastily

bandaged, and he was lifted into la Klosking's carriage. One of the people of the theatre was directed to go on the box, and la Klosking and Ashmead supported him, and he was taken to her lodgings. She directed him to be laid on a couch, and a physician sent for, Miss Gale not having yet returned from Liverpool, whither she had gone to attend a lecture.

Ashmead went for the physician. But almost at the door he met Miss Gale and Mr. Vizard.

"Miss," said he, "you are wanted. There has been an accident. Mr. Severne has fallen through a trap, and into the cellar."

"No bones broken?"

"Not he: he has only broken his head; and that will cost her a broken heart."

"Where is he?"

"Where I hoped never to see him again."

"What! in her house?" said Rhoda, and hurried off at once.

"Mr. Ashmead," said Vizard, "a word with you."

"By all means, Sir," said Ashmead, "as we go for the doctor. Dr. Menteith has a great name. He lives close by your hotel, Sir."

As they went, Vizard asked him what he meant by saying this incident would cost her a broken heart.

"Why, Sir," said Ashmead, "he is on his good behavior to get back; has been for months begging and praying just to be let live under the same roof. She has always refused. But some fellows have such luck! I don't say he fell down a trap on purpose; but he has done it, and no broken bones, but plenty of blood. That is the very thing to overcome a woman's feelings; and she is not proof against pity. He will have her again. Why, she is his nurse now; and see how that will work. We have a week's more business here; and, by bad luck, a dead fortnight, all along of Dublin falling through unexpectedly. He is as artful as Old Nick; he will spin out that broken head of his and make it last all the three weeks; and she will nurse him, and he will be weak and grateful, and cry and beg her pardon six times a day, and she is only a woman, after all; and they are man and wife, when all is done: the road is beaten. They will run upon it again, till his time is up to play the rogue as bad as ever."

"You torture me," said Vizard.

"I am afraid I do, Sir. But I feel it my duty. Mr. Vizard, you are a noble gentleman, and I am only what you see; but the humblest folk will have their likes and dislikes, and I have a great respect for you, Sir. I can't tell you the mixture of things I feel when I see you in the same box every night. Of course I am her agent, and the house would not be complete without you; but as a man I am sorry. Especially now that she has let him into her house. Take

a humble friend's advice, Sir, and cut it. Don't you come between any woman and her husband, especially a public lady. She will never be more to you than she is. She is a good woman, and he must keep gaining ground. He has got the pull. Rouse all your pride, Sir, and your manhood—and you have got plenty of both—and cut it; don't look right nor left, but cut it—and forgive my presumption."

Vizard was greatly moved. "Give me your hand," he said; "you are a worthy man. I'll act on your advice, and never forget what I owe you. Stick to me like a leech, and see me off by the next train, for I am going to tear my heart out of my bosom."

Luckily there was a train in half an hour, and Ashmead saw him off; then went to supper. He did not return to Ina's lodgings. He did not want to see Severne nursed. He liked the fellow too, but he saw through him clean, and he worshiped Ina Klosking.

CHAPTER XXX.

AT one o'clock next day Ashmead received a note from Mademoiselle Klosking, saying: "Arrange with Mr. X—to close my tour with Manchester. Pay the forfeit, if required." She was with the company at a month's notice on either side, you must understand.

Instead of going to the manager, he went at once, in utter dismay, to Mademoiselle Klosking, and there learned in substance what I must now briefly relate.

Miss Gale found Edward Severne deposited on a sofa. Ina was on her knees by his side, sponging his bleeding temple, with looks of gentle pity. Strange to say, the wound was in the same place as his wife's, but more contused, and no large vein was divided. Miss Gale soon stanchd that. She asked him where his pain was. He said it was in his head and his back, and he cast a haggard, anxious look on her.

"Take my arm," said she. "Now stand up."

He tried, but could not, and said his legs were benumbed. Miss Gale looked grave.

"Lay him on my bed," said la Klosking. "That is better than these hard couches."

"You are right," said Miss Gale. "Ring for the servants. He must be moved gently."

He was carried in and set upon the edge of the bed, and his coat and waistcoat taken off. Then he was laid gently down on the bed, and covered with a down quilt.

Doctress Gale then requested Ina to leave the room while she questioned the patient.

Ina retired.

In a moment or two Miss Gale came out to her softly.

At sight of her face la Klosking said, "Oh dear! it is more serious than we thought."

"Very serious."

"Poor Edward!"

"Collect all your courage, for I can not lie, either to patient or friend."

"And you are right," said la Klosking, trembling. "I see he is in danger."

"Worse than that. Where there's danger there is hope. Here there is none. HE IS A DEAD MAN!"

"Oh, no! no!"

"He has broken his back, and nothing can save him. His lower limbs have already lost sensation. Death will creep over the rest. Do not disturb your mind with idle hopes. You have two things to thank God for—that you took him into your own house, and that he will die easily. Indeed, were he to suffer, I should stupefy him at once, for nothing can *hurt* him."

Ina Klosking turned faint, and her knees gave way under her. Rhoda ministered to her, and while she was so employed, Dr. Menteith was announced. He was shown in to the patient, and the accident described to him. He questioned the patient, and examined him alone.

He then came out, and said he would draw a prescription. He did so.

"Doctor," said la Klosking, "tell me the truth. It can not be worse than I fear."

"Madam," said the doctor, "medicine can do nothing for him. The spinal cord is divided. Give him any thing he fancies, and my prescription if he suffers pain, not otherwise. Shall I send you a nurse?"

"No," said Mademoiselle Klosking; "*we* will nurse him night and day."

He retired, and the friends entered on their sad duties.

When Severne saw them both by his bedside, with earnest looks of pity, he said: "Do not worry yourselves. I'm booked for the long journey. Ah, well, I shall die where I ought to have lived, and might have, if I had not been a fool."

Ina wept bitterly.

They nursed him night and day. He suffered little, and when he did, Miss Gale stupefied the pain at once, for, as she truly said, "nothing can hurt him." Vitality gradually retired to his head, and lingered there a whole day. But, to his last moment, the art of pleasing never abandoned him. Instead of worrying for this or that every moment, he showed in this desperate condition singular patience and well-bred fortitude. He checked his wife's tears; assured her it was all for the best, and that he was reconciled to the inevitable. "I have had a happier time than I deserve," said he, "and now I have a painless death, nursed by two sweet women. My only regret is that I shall not be able to repay your devotion, Ina, nor become worthy of your friendship, Miss Gale."

He died without fear, it being his conviction that he should return after death to the precise condition in which he was before birth; and when they begged him to see a clergyman, he said, "Pray do not give yourselves or him that trouble. I can melt back into the universe without his assistance."

He even died content; for this polished Bohemian had often foreseen that, if he lived long, he should die miserably.

But the main feature of his end was his extraordinary politeness. He paid Miss Gale compliments just as if he was at his ease on a sofa; and scarce an hour before his decease he said, faintly, "I declare—I have been so busy—dying—I have forgotten to send my kind regards to good Mr. Ashmead. Pray tell him I did not forget his kindness to me."

He just ceased to live, so quiet was his death, and a smile rested on his dead features, and they were as beautiful as ever.

So ended a fair, pernicious creature, endowed too richly with the art of pleasing, and quite devoid of principle. Few bad men knew right so well, and went so wrong.

Ina buried her face for hours on his bed, and kissed his cold features and hand. She had told him before he died she would recall all her resolutions, if he would live. But he was gone. Death buries a man's many faults, and his few virtues rise again. She mourned him sincerely, and would not be comforted; she purchased a burying-place forever, and laid him in it; then she took her aching heart far away, and was lost to the public and to all her English friends.

The faithful Rhoda accompanied her half-way to London; then returned to her own duties in Barfordshire.

CHAPTER XXXI.

I MUST now retrograde a little to relate something rather curious, and I hope not uninteresting.

Zoe Vizard had been for some time acting on Mrs. Gale's advice—building, planning for the good of the poor, and going out of herself more and more. She compared notes constantly with Miss Gale, and conceived a friendship for her. It had been a long time coming, because at first she disliked Miss Gale's manners very much. But that lady had nursed her tenderly, and now advised her, and Zoe, who could not do any thing by halves, became devoted to her.

As she warmed to her good work, she gave signs of clearer judgment. She never mentioned Severne; but she no longer absolutely avoided Ina Klosking's name; and one day she spoke of her as a high-princi-

pled woman; for which the Gale kissed her on the spot.

One name she often uttered, and always with regret and self-reproach—Lord Uxmoor's. I think that, now she was herself building and planning for the permanent improvement of the poor, she felt the tie of a kindred sentiment. Uxmoor was her predecessor in this good work too, and would have been her associate if she had not been so blind. This thought struck deep in her. Her mind ran more and more on Uxmoor, his manliness, his courage in her defense, and his gentlemanly fortitude and bravery in leaving her, without a word, at her request. Running over all these, she often blushed with shame, and her eyes filled with sorrow at thinking of how she had treated him; and lost him forever by not deserving him.

She even made oblique and timid inquiries, but could learn nothing of him, except that he sent periodical remittances to Miss Gale for managing his improvements. These, however, came in through a country agent from a town agent, and left no clew.

But one fine day, with no warning except to his own people, Lord Uxmoor came home; and the next day rode to Hillstoke to talk matters over with Miss Gale. He was fortunate enough to find her at home. He thanked her for the zeal and enthusiasm she had shown, and the progress his works had made under her supervision.

He was going away without even mentioning the Vizard family.

But the crafty Gale detained him. "Going to Vizard Court?" said she.

"No," said he, very dryly.

"Ah, I understand; but perhaps you would not mind going with me as far as Islip. There is something there I wish you to see."

"Humph! Is it any thing very particular? Because—"

"It is. Three cottages rising, with little flower gardens in front, square plots behind, and arrangements for breeding calves, with other ingenious novelties. A new head come into our business, my lord."

"You have converted Vizard? I thought you would. He is a satirical fellow, but he will listen to reason."

"No, it is not Mr. Vizard: indeed, it is no convert of mine. It is an independent enthusiast. But I really believe your work at home had some hand in firing her enthusiasm."

"A lady! Do I know her?"

"You may. I suppose you know every body in Barfordshire. Will you come? Do!"

"Of course I will come, Miss Gale. Please tell one of your people to walk my horse down after us."

She had her hat on in a moment, and walked him down to Islip.

Her tongue was not idle on the road. "You don't ask after the people," said she. "There's poor Miss Vizard. She had a sad illness. We were almost afraid we should lose her."

"Heaven forbid!" said Uxmoor, startled by this sudden news.

"Mademoiselle Klosking got quite well: and oh! what do you think? Mr. Severne turned out to be her husband."

"What is that?" shouted Uxmoor, and stopped dead short. "Mr. Severne a married man!"

"Yes, and Mademoiselle Klosking a married woman."

"You amaze me. Why, that Mr. Severne was paying his attentions to Miss Vizard."

"So I used to fancy," said Rhoda, carelessly. "But, you see, it came out he was married, and so of course she packed him off with a flea in his ear."

"Did she? When was that?"

"Let me see: it was the 17th of October."

"Why, that was the very day I left England."

"How odd! Why did you not stay another week? Gentlemen are so impatient. Never mind, that is an old story now. Here we are: those are the cottages. The workmen are at dinner. Ten to one the enthusiast is there: this is her time. You stay here. I'll go and see." She went off on tip-toe, and peeped and pried here and there, like a young witch. Presently she took a few steps toward him, with her finger mysteriously to her lips, and beckoned him. He entered into the pantomime—she seemed so earnest in it—and came to her softly.

"Do just take a peep in at that opening for a door," said she; "then you'll see her; her back is turned. She is lovely; only you know she has been ill, and I don't think she is very happy."

Uxmoor thought this peeping at enthusiasts rather an odd proceeding, but Miss Gale had primed his curiosity, and he felt naturally proud of a female pupil. He stepped up lightly, looked in at the door, and, to his amazement, saw Zoe Vizard sitting on a carpenter's bench, with her lovely head in the sun's rays. He started, then gazed, then devoured her with his eyes.

What! was this his pupil?

How gentle and sad she seemed! All his stoicism melted at the sight of her. She sat in a sweet, pensive attitude, pale and drooping, but, to his fancy, lovelier than ever. She gave a little sigh. His heart yearned. She took out a letter, read it slowly, and said, softly and slowly, "Poor fellow!" He thought he recognized his own handwriting, and could stand no more. He rushed in, and was going to speak to her; but she screamed, and no conjurer ever made a card disappear quicker than she did that letter, as she bounded away

like a deer, and stood, blushing scarlet, and palpitating all over.

Uxmoor was ashamed of his brusquerie.

"What a brute I am, to frighten you like this!" said he. "Pray forgive me; but the sight of you, after all these weary months—and you said, 'Poor fellow!'"

"Did I?" said Zoe, faintly, looking scared.

"Yes, sweet Zoe, and you were reading a letter."

No reply.

"I thought the poor fellow might be myself. Not that I am to be pitied, if you think of me still."

"I do, then—very often. Oh, Lord Uxmoor, I want to go down on my knees to you."

"That is odd, now; for it is exactly what I should like to do to you."

"What for? It is I who have behaved so ill."

"Never mind that: I love you."

"But you mustn't. You must love some worthy person."

"Oh, you leave that to me. I have no other intention. But may I just see whose letter you were reading?"

"Oh, pray don't ask me."

"I insist on knowing."

"I will not tell you. There it is." She gave it to him with a guilty air, and hid her face.

"Dear Zoe, suppose I was to repeat the offer I made here?"

"I advise you not," said she, all in a flurry.

"Why?"

"Because. Because—I might say 'Yes.'"

"Well, then I'll take my chance once more. Zoe, will you try and love me?"

"Try? I believe I do love you, or nearly. I think of you very often."

"Then you will do something to make me happy."

"Any thing; every thing."

"Will you marry me?"

"Yes, that I will," said Zoe, almost impetuously; "and then," with a grand look of conscious beauty, "I can *make* you forgive me."

Uxmoor, on this, caught her in his arms, and kissed her with such fire that she uttered a little stifled cry of alarm; but it was soon followed by a sigh of complacency, and she sank resistless on his manly breast.

So, after two sieges, he carried that fair citadel by assault.

Then let not the manly heart despair, nor take a mere brace of "Noes" from any woman. Nothing short of three negatives is serious.

They walked out arm in arm, and very close to each other; and he left her, solemnly engaged.

Leaving this pair to the delights of courtship, and growing affection on Zoe's side—for a warm attachment of the noblest kind

did grow, by degrees, out of her penitence and esteem, and desire to repair her fault—I must now take up the other thread of this narrative, and apologize for having inverted the order of events; for it was, in reality, several days after this happy scene, that Mademoiselle Klosking sent for Miss Gale.

CHAPTER XXXII.

VIZARD, then, with Ashmead, returned home in despair; and Zoe, now happy in her own mind, was all tenderness and sisterly consolation. They opened their hearts to each other, and she showed her wish to repay the debt she owed him. How far she might have succeeded, in time, will never be known. For he had hardly been home a week, when Miss Gale returned, all in black, and told him Severne was dead and buried.

He was startled, and even shocked, remembering old times; but it was not in human nature he should be sorry. Not to be indecorously glad at so opportune an exit was all that could be expected from him.

When she had given him the details, his first question was, "How did she bear it?"

"She is terribly cut up—more than one would think possible; for she was ice and marble to him before he was hurt to death."

"Where is she?"

"Gone to London. She will write to me, I suppose—poor dear. But one must give her time."

From that hour Vizard was in a state of excitement, hoping to hear from Ina Klosking or about her; but unwilling, from delicacy, to hurry matters.

At last he became impatient, and wrote to Ashmead, whose address he had, and said, frankly, he had a delicacy in intruding on Mademoiselle Klosking in her grief. Yet his own feelings would not allow him to seem to neglect her. Would Mr. Ashmead, then, tell him where she was, as she had not written to any one in Barfordshire—not even to her tried friend, Miss Gale.

He received an answer by return of post:

"DEAR SIR,—I am grieved to tell you that Mademoiselle Klosking has retired from public life. She wrote to me, three weeks ago, from Dover, requesting me to accept, as a token of her esteem, the surplus money I hold in hand for her—I always drew her salary—and bidding me farewell. The sum included her profits by Psalmody, minus her expenses, and was so large it could never have been intended as a mere recognition of my humble services; and I think I have seldom felt so downhearted as on receiving this princely donation. It has enabled me to take better offices, and it may be the

foundation of a little fortune; but I feel that I have lost the truly great lady who has made a man of me. Sir, the relish is gone for my occupation. I can never be so happy as I was in working the interests of that great genius, whose voice made our leading soprani sound like whistles, and who honored me with her friendship. Sir, she was not like other leading ladies. She never bragged, never spoke ill of any one; and *you* can testify to her virtue and her discretion.

"I am truly sorry to learn from you that she has written to no one in Barfordshire. I saw, by her letter to me, she had left the stage; but her dropping you all looks as if she had left the world. I do hope she has not been so mad as to go into one of those cursed convents.

"Mr. Vizard, I will now write to friends in all the Continental towns where there is good music. She will not be able to keep away from that long. I will also send photographs; and hope we may hear something. If not, perhaps a *judicious advertisement* might remind her that she is inflicting pain upon persons to whom she is dear. I am, Sir, your obliged and grateful servant,

"JOSEPH ASHMEAD."

Here was a blow. I really believe Vizard felt this more deeply than all his other disappointments.

He brooded over it for a day or two; and then, as he thought Miss Gale a very ill-used person, though not, of course, so ill-used as himself, he took her Ashmead's letter.

"This is nice," said she. "There! I must give up loving women. Besides, they throw me over the moment a man comes, if it happens to be the right one."

"Unnatural creatures!" said Vizard.

"Ungrateful, at all events."

"Do you think she has gone into a convent?"

"Not she. In the first place, she is a Protestant; and, in the second, she is not a fool."

"I will advertise."

"The idea!"

"Do you think I am going to sit down with my hands before me, and lose her forever?"

"No, indeed; I don't think you are that sort of a man at all—ha! ha!"

"Oh, Miss Gale, pity me. Tell me how to find her. That Fanny Dover says women are only enigmas to men; they understand one another."

"What!" said Rhoda, turning swiftly on him; "does that little chit pretend to read my noble Ina?"

"If she can not, perhaps you can. You are so shrewd. Do tell me, what does it all mean?"

"It means nothing at all, I dare say, only

a woman's impulse. They are such geese at times, every one of them."

"Oh, if I did but know what country she is in, I would ransack it."

"Hum!—countries are biggish places."

"I don't care."

"What will you give me to tell you where she is at this moment?"

"All I have in the world."

"That is sufficient. Well, then, first assign me your estates; then fetch me an ordnance map of creation, and I will put my finger on her."

"You little mocking fiend, you!"

"I am not. I'm a tall, beneficent angel; and I'll tell you where she is—for nothing. Keep your land: who wants it?—it is only a bother."

"For pity's sake, don't trifle with me."

"I never will, where your heart is interested. She is at Zutzig."

"Ah, you good girl! She has written to you."

"Not a line, the monster! And I'll serve her out. I'll teach her to play hide-and-seek with Gale, M.D.!"

"Zutzig!" said Vizard: "how can you know?"

"What does *that* matter? Well, yes—I will reveal the mental process. First of all, she has gone to her mother."

"How do you know that?"

"Oh, dear, dear, dear! Because that is where every daughter goes in trouble. I should; she *has*. Fancy you not seeing that! Why, Fanny Dover would have told you that much in a moment. But now you will have to thank *my* mother for teaching me Attention, the parent of Memory. Pray, Sir, who were the witnesses to that abominable marriage of hers?"

"I remember two, Baron Hompesch—"

"No, Count Hompesch."

"And Count Meurice."

"Viscount. What, have you forgotten Herr Formes, Fräulein Graafe, Züg, the Capellmeister, and her very mother? Come now, whose daughter is she?"

"I forget, I'm sure."

"Walter Ferris and Eva Klosking, of Zutzig, in Denmark. Pack—start for Copenhagen. Consult an ordnance map there. Find out Zutzig. Go to Zutzig, and you have got her. It is some hole in a wilderness, and she can't escape."

"You clever little angel! I'll be there in three days. Do you really think I shall succeed?"

"Your own fault if you don't. She has run into a *cul-de-sac* through being too clever; and, besides, women sometimes run away just to be caught, and hide on purpose to be found. I should not wonder if she has said to herself, 'He will find me if he loves me so very, very much—I'll try him.'"

"Not a word more, angelic Fox," said Vizard. "I'm off to Zutzig."

He went out on fire. She opened the window, and screeched after him, "Every thing is fair after her behavior to me. Take her a book of those spiritual songs she is so fond of. 'Johnny comes marching home' is worth the lot, I reckon."

Away went Vizard; found Copenhagen with ease; Zutzig with difficulty, being a small village. But once there, he soon found the farm-house of Eva Klosking. He drove up to the door. A Danish laborer came out from the stable directly; and a buxom girl, with pale golden hair, opened the door. These two seized his luggage and conveyed it into the house, and the hired vehicle to the stable. Vizard thought it must be an inn.

The girl bubbled melodious sounds, and ran off and brought a sweet, venerable dame. Vizard recognized Eva Klosking at once.

The old lady said, "Few strangers come here: are you not English?"

"Yes, madam."

"It is Mr. Vizard, is it not?"

"Yes, madam."

"Ah, Sir, my daughter will welcome you, but not more heartily than I do. My child has told me all she owes to you;" then, in Danish, "God bless the hour you come under this roof!"

Vizard's heart beat tumultuously, wondering how Ina Klosking would receive him. The servant had told her a tall stranger was come. She knew in a moment who it was; so she had the advantage of being prepared.

She came to him, her cheeks dyed with blushes, and gave him both hands. "You here!" said she; "oh, happy day! Mother, he must have the south chamber. I will go and prepare it for him. Tecla!—Tecla!" and she was all hostess. She committed him to her mother, while she and the servant went up stairs.

He felt discomfited a little. He wanted to know, all in a moment, whether she would love him.

However, Danish hospitality has its good side. He soon found out he might live the rest of his days there if he chose.

He soon got her alone, and said, "You knew I should find you, cruel one."

"How could I dream of such a thing?" said she, blushing.

"Oh, Love is a detective. You said to yourself, 'If he loves me as I ought to be loved, he will search Europe for me; but he will find me.'"

"Oh, then it was not to be at peace and rest on my mother's bosom I came here; it was to give you the trouble of running after me. Oh, fie!"

"You are right. I am a vain fool."

"No, that you are not. After all, how do

I know all that was in my heart? [Ahem!] Be sure of this, you are very welcome. I must go and see about your dinner."

In that Danish farm-house life was very primitive. Eva Klosking and both her daughters helped the two female servants, or directed them, in every department. So Ina, who was on her defense, had many excuses for escaping Vizard when he pressed her too hotly. But at last she was obliged to say, "Oh, pray, my friend—we are in Denmark: here widows are expected to be discreet."

"But that is no reason why the English fellows who adore them should be discreet."

"Perhaps not; but then the Danish lady runs away."

Which she did.

But, after the bustle of the first day, he had so many opportunities. He walked with her, sat with her while she worked, and hung over her, entranced, while she sang. He produced the book from Vizard Court, without warning, and she screamed with delight at sight of it, and caught his hand in both hers and kissed it. She revelled in those sweet strains which had comforted her in affliction; and, oh! the eyes she turned on him after singing any song in this particular book! Those tender glances thrilled him to the very marrow.

To tell the honest truth, his arrival was a godsend to Ina Klosking. When she first came home to her native place, and laid her head on her mother's bosom, she was in Elysium. The house, the wood fires, the cooing doves, the bleating calves, the primitive life, the recollections of childhood—all were balm to her, and she felt like ending her days there. But, as the days rolled on, came a sense of monotony and excessive tranquillity. She was on the verge of *ennui* when Vizard broke in upon her.

From that moment there was no stagnation. He made life very pleasant to her; only her delicacy took the alarm at his open declarations; she thought them so premature.

At last he said to her, one day, "I begin to fear you will never love me as I love you."

"Who knows?" said she. "Time works wonders."

"I wonder," said he, "whether you will ever marry any other man?"

Ina was shocked at that. "Oh, my friend, how could I—unless," said she, with a sly side-glance, "you consented?"

"Consent? I'd massacre him."

Ina turned toward him. "You asked my hand at a time when you thought me—I don't know what you thought—that is a thing no woman could forget. And now you have come all this way for me. I am yours, if you can wait for me."

He caught her in his arms. She disengaged herself gently, and her hand rested an unnecessary moment on his shoulder. "Is that how you understand 'waiting?'" said she, with a blush, but an indulgent smile.

"What is the use waiting?"

"It is a matter of propriety."

"How long are we to wait?"

"Only a few months. My friend, it is like a boy to be too impatient. Alas! would you marry me in my widow's cap?"

"Of course I would. Now, Ina love, a widow who has been two years separated from her husband!"

"Certainly, that makes a difference—in one's own mind. But one must respect the opinion of the world. Dear friend, it is of you I think, though I speak of myself."

"You are an angel. Take your own time. After all, what does it matter? I don't leave Zutzig without you."

Ina's pink tint and sparkling eyes betrayed any thing but horror at that insane resolution. However, she felt it her duty to say that it was unfortunate she should always be the person to distract him from his home duties.

"Oh, never mind them," said this single-hearted lover. "I have appointed Miss Gale viceroy."

However, one day he had a letter from Zoe, telling him that Lord Uxmoor was now urging her to name the day; but she had declined to do that, not knowing when it might suit him to be at Vizard Court. "But, dearest," said she, "mind, you are not to hurry home for me. I am very happy as I am, and I hope you will soon be as happy, love. She is a noble woman."

The latter part of this letter tempted Vizard to show it to Ina. He soon found his mistake. She kissed it, and ordered him off. He remonstrated. She put on, for the first time in Denmark, her marble look, and said, "You will lessen my esteem if you are cruel to your sister. Let her name the wedding day at once; and you must be there to give her away, and bless her union, with a brother's love."

He submitted, but a little sullenly, and said it was very hard.

He wrote to his sister accordingly, and she named the day, and Vizard settled to start for home and be in time.

As to the proprieties, he had instructed Miss Maitland and Fanny Dover, and given them and la Gale *carte blanche*. It was to be a magnificent wedding.

This being excitement, Fanny Dover was in paradise. Moreover, a rosy-cheeked curate had taken the place of the venerable vicar, and Miss Dover's threat to flirt out the stigma of a nun was executed with promptitude, zeal, pertinacity, and the dexterity that comes of practice. When the

day came for his leaving Zutzig, Vizard was dejected. "Who knows when we may meet again?" said he.

Ina consoled him. "Do not be sad, dear friend. You are doing your duty; and as you do it partly to please me, I ought to try and reward you, ought I not?" And she gave him a strange look.

"I advise you not to press that question," said he.

At the very hour of parting, Ina's eyes were moist with tenderness, but there was a smile on her face very expressive; yet he could not make out what it meant. She did not cry. He thought that hard. It was his opinion that women could always cry. She might have done the usual thing, just to gratify him.

He reached home in good time, and played the grand Seigneur—nobody could do it better when driven to it—to do honor to his sister. She was a peerless bride: she stood superior, with ebon locks and coal-black eyes, encircled by six bride-maids—all picked blondes. The bevy, with that glorious figure in the middle, seemed one glorious and rare flower.

After the wedding, the breakfast; and then the travelling carriage; the four liveried postilions bedecked with favors.

But the bride wept on Vizard's neck; and a light seemed to leave the house when she was gone. The carriages kept driving away one after another till four o'clock: and then Vizard sat disconsolate in his study, and felt very lonely.

Yet a thing no bigger than a leaf sufficed to drive away this sombre mood, a piece of amber-colored paper scribbled on with a pencil: a telegram from Ashmead: "Good news: lost sheep turned up. Is now with her mother at Claridge's Hotel."

Then Vizard was in raptures. Now he understood Ina's composure, and the half-sly look she had given him, and her dry eyes at parting, and other things. He tore up to London directly, with a telegram flying ahead: burst in upon her, and had her in his arms in a moment, before her mother: she fenced no longer, but owned he had gained her love, as he had deserved it in every way.

She consented to be married that week in London: only she asked for a Continental tour before entering Vizard Court as his wife; but she did not stipulate even for that, she only asked it submissively, as one whose duty it now was to obey, not dictate.

They were married in St. George's Church very quietly, by special license. Then they saw her mother off, and crossed to Calais. They spent two happy months together on the Continent, and returned to London.

But Vizard was too old-fashioned and too proud of his wife to sneak into Vizard Court

with her. He did not make it a county matter; but he gave the village such a *fête* as had not been seen for many a day. The preparations were intrusted to Mr. Ashmead, at Ina's request. "He will be sure to make it theatrical," she said; "but perhaps the simple villagers will admire that, and it will amuse you and me, love: and the poor dear old Thing will be in his glory—I hope he will not drink too much."

Ashmead was indeed in his glory. Nothing had been seen in a play that he did not electrify Islip with, and the surrounding villages. He pasted large posters on walls and barn doors, and his small bills curled round the patriarchs of the forest and the road-side trees, and blistered the gate posts.

The day came. A soapy pole, with a leg of mutton on high for the successful climber; races in sacks; short blindfold races with wheelbarrows; pig with a greasy tail, to be won by him who could catch him and shoulder him without touching any other part of him; bowls of treacle for the boys to duck heads in and fish out coins; skittles, nine-pins, Aunt Sally, etc., etc., etc.

But what astonished the villagers most was a May-pole, with long ribbons, about which ballet-girls, undisguised as Highlanders, danced, and wound and unwound the party-colored streamers, to the merry fiddle, and then danced reels upon a platform, then returned to their little tent: but out again and danced hornpipes undisguised as Jacky Tars.

Beer flowed from a sturdy regiment of barrels. "The Court" kitchen and the village bake-house kept pouring forth meats, baked, boiled, and roast; there was a pile of loaves like a hay-stack; and they roasted an ox whole on the Green; and, when they found they were burning him raw, they fetched the butcher, like sensible fellows, and dismembered the giant, and so roasted him reasonably.

In the midst of the reveling and feasting, Vizard and Mrs. Vizard were driven into Islip village, in the family coach with four horses, streaming with ribbons.

They drove round the green, bowing and smiling in answer to the acclamations and blessings of the poor, and then to Vizard Court. The great doors flew open. The servants, male and female, lined the hall on both sides, and received her bowing and courtesying low, on the very spot where she had nearly met her death; her husband took her hand and conducted her in state to her own apartment.

It was open house to all, that joyful day, and at night magnificent fire-works on the sweep, seen from the drawing-room by Mrs. Vizard, Miss Maitland, Miss Gale, Miss Dover, and the rosy-cheeked curate, whom she had tied to her apron strings.

At two in the morning, Mr. Harris showed

Mr. Ashmead to his couch. Both gentlemen went up the stairs a little graver than any of our modern judges, and firm as a rock: but their firmness resembled that of a roof rather than a wall; for these dignities as they went made one inverted V—so, A.

It is time the *Woman-Hater* drew to a close, for the woman-hater is spoiled. He begins sarcastic speeches, from force of habit, but stops short in the middle. He is a very happy man, and owes it to a woman, and knows it. He adores her; and to love well is to be happy. But, besides that, she watches over his happiness and his good with that unobtrusive but minute vigilance which belongs to her sex, and is often misapplied, but not so very often as cynics say. Even the honest friendship between him and the remarkable woman he calls his "virago," gives him many a pleasant hour. He is still a humorist, though cured of his fling at the fair sex. His last tolerable hit was at the monosyllabic names of the immortal composers his wife had disinterred in his library. Says he to parson Denison, hot from Oxford, "They remind me of the Oxford poets in the last century:

"Alma novem celebres genuit Rhedyeina Poetas:
Bubb, Stubb, Grubb, Crabbe, Trappe, Brome, Carey, Tickell, Evans."

As for Ina Vizard—la Klosking no longer—she has stepped into her new place with her native dignity, seemliness, and composure. At first a few county ladies put their little heads together and prepared to give themselves airs; but the beauty, dignity, and enchanting grace of Mrs. Vizard swept this little faction away like small dust. Her perfect courtesy, her mild but deep dislike of all feminine backbiting, her dead silence about the absent, except when she can speak kindly, these rare traits have forced, by degrees, the esteem and confidence of her own sex. As for the men, they accepted her at once with enthusiasm. She and Lady Uxmoor are the acknowledged belles of the county. Lady Uxmoor's face is the most admired; but Mrs. Vizard comes next, and her satin shoulders, statuesque bust and arms, and exquisite hand, turn the scale with some. But when she speaks, she charms; and when she sings, all competition dies.

She is faithful to music, and especially to sacred music. She is not very fond of singing at parties, and sometimes gives offense by declining. Music sets fools talking, because it excites them, and then their folly comes out by the road nature has provided. But when Mrs. Vizard has to sing in one key, and people talk in five other keys, that gives this artist such physical pain that she often declines, merely to escape it. It does not much mortify her vanity, she has so little.

She always sings in church, and sings out, too, when she is there, and plays the har-

monium. She trains the villagers—girls, boys, and adults—with untiring good humor and patience.

Among her pupils are two fine voices—Tom Wilder, a grand bass, and the rosy-cheeked curate, a greater rarity still, a genuine counter-tenor.

These two can both read music tolerably; but the curate used to sing every thing, however full of joy, with a pathetic whine, for which Vizard chaffed him in vain; but Mrs. Vizard *persuaded* him out of it, where argument and satire failed.

People come from far and near to hear the hymns at Islip Church, sung in full harmony—trebles, tenor, counter-tenor, and bass.

A trait—she allows nothing to be sung in church unrehearsed. The rehearsals are on Saturday night, and never shirked, such is the respect for “Our Dame.” To be sure, “Our Dame” fills the stomachs and wets the whistles of her faithful choir on Saturday nights.

On Sunday night there are performances of sacred music in the great dining-hall. But these are rather more ambitious than those in the village church. The performers meet on that happy footing of *camaraderie* the fine arts create, the superior respect shown to Mrs. Vizard being mainly paid to her as the greater musician. They attack anthems and services; and a trio, by the parson, the blacksmith, and “Our Dame,” is really an extraordinary treat, owing to the great beauty of the voices. It is also piquant to hear the female singer constantly six and often ten notes below the male counter-tenor; but then comes Wilder with his diapason, and the harmony is noble; the more so that Mrs. Vizard rehearses her pupils in the swell—a figure too little practiced in music, and nowhere carried out as she does it.

One night the organist of Barford was there. They sang Kent’s service in F, and Mrs. Vizard still admired it. She and the parson swelled in the duet, “To be a light to lighten the Gentiles,” etc. Organist approved the execution, but said the composition was a meagre thing, quite out of date. “We have much finer things now by learned men of the day.”

“Ah,” said she, “bring me one.”

So, next Sunday, he brought her a learned composition, and played it to her, preliminary to their singing it. But she declined it on the spot. “What!” said she. “Mr. X——, would you compare this meaningless stuff with Kent in F? Why, in Kent the dominant sentiment of each composition is admirably preserved. His ‘Magnificat’ is lofty jubilation, with a free onward rush. His ‘Dimittis’ is divine repose after life’s fever. But this poor pedant’s ‘Magnificat’ begins with a mere crash, and then falls into the pathetic—an excellent thing in its

place, but not in a song of triumph. As to his ‘Dimittis,’ it simply defies the words. This is no Christian sunset. It is not good old Simeon gently declining to his rest, content to close those eyes which had seen the world’s salvation. This is a tempest, and all the windows rattling, and the great Napoleon dying, amidst the fury of the elements, with ‘tête d’armée!’ on his dying lips, and ‘battle’ in his expiring soul. No, Sir; if the learned Englishmen of this day can do nothing nearer the mark than DOLEFUL MAGNIFICATS and STORMY NUNC DIMITTISES, I shall stand faithful to poor dead Kent and his fellows—they were my solace in sickness and sore trouble.”

In accordance with these views of vocal music, and desirous to expand its sphere, Mrs. Vizard has just offered handsome prizes in the county for the best service, in which the dominant sentiment of the words shall be as well preserved as in Kent’s despised service; and another prize to whoever can set any famous short secular poem, or poetical passage (not in ballad metre), to good and appropriate music.

This has elicited several pieces. The composers have tried their hands on Dryden’s Ode; on the meeting of Hector and Andromache (Pope’s Homer); on two short poems of Tennyson, etc., etc.

But it is only the beginning of a good thing. The pieces are under consideration. But Vizard says the competitors are triflers. *He* shall set Mr. Arnold’s version of “Hero and Leander” to the harp, and sing it himself. This, he intimates, will silence competition, and prove an era. I think so too, if his music should *happen* to equal the lines in value. But I hardly think it will, because the said Vizard, though he has taste and ear, does not know one note from another. So I hope “Hero and Leander” will fall into abler hands; and, in any case, I trust Mrs. Vizard will succeed in her worthy desire to enlarge very greatly the sphere and the nobility of vocal music. It is a desire worthy of this remarkable character, of whom I now take my leave with regret.

I must own that regret is caused in part by my fear that I may not have done her all the justice I desired.

I have long felt and regretted that many able female writers are doing much to perpetuate the petty vices of a sex which, after all, is at present but half educated, by devoting three thick volumes to such empty women as Biography, though a lower art than Fiction, would not waste three pages on. They plead truth and fidelity to nature. “We write the average woman for the average woman to read,” say they. But they are not consistent; for the average woman is under five feet, and rather ugly. Now these paltry women are all beautiful—*καλὰι τε μεγάλαι τε*, as Homer hath it.

Fiction has just as much right to select large female souls as Biography or Painting has; and to pick out a selfish, shallow, illiterate creature, with nothing but beauty, and bestow three enormous volumes on her, is to make a perverse selection, beauty being, after all, rarer in women than wit, sense, and goodness. It is as false and ignoble in art, as to marry a pretty face without heart and brains is silly in conduct.

Besides, it gives the female reader a low model instead of a high one, and so does her a little harm; whereas a writer ought to do good—or try, at all events.

Having all this in my mind, and remembering how many noble women have shone like stars in every age and every land, and feeling sure that, as civilization advances, such women will become far more common, I have tried to look ahead and paint la Klosting.

But such portraiture is difficult. It is like writing a statue.

Qui mihi non credit faciat licet ipse periculum
Mox fuerit studiis æquior ille meis.

Harrington Vizard, Esq., caught Miss Fanny Dover on the top round but one of the steps in his library. She looked down, pinkish, and said she was searching for *Tillotson's Sermons*.

"What on earth can you want of them?"

"To improve my mind, to be sure," said the minx.

Vizard said, "Now you stay there, miss—don't you move;" and he sent for Iua. She came directly, and he said, "Things have come to a climax. My lady is hunting for *Tillotson's Sermons*. Poor Denison!" (That was the rosy curate's name.)

"Well," said Fanny, turning red, "I told you I *should*. Why should I be good any longer? All the sick are cured one way or other, and I am myself again."

"Humph!" said Vizard. "Unfortunately for your little plans of conduct, the heads of this establishment, here present, have sat in secret committee, and your wings are to be clipped—by order of Council."

"La!" said Fanny, pertly.

Vizard imposed silence with a lordly wave. "It is a laughable thing, but this divine is in earnest. He has revealed his hopes and fears to me."

"Then he is a great baby," said Fanny, coming down the steps. "No, no; we are both too poor." And she vented a little sigh.

"Not you. The vicar has written to vacate. Now I don't like you much, because you never make me laugh: but I'm awfully fond of Denison; and if you will marry my dear Denison, you shall have the vicarage: it is a fat one."

"Oh, cousin!"

"And," said Mrs. Vizard, "he permits me

to furnish it for you. You and I will make it 'a bijou.'"

Fanny kissed them both impetuously; then said she would have a little cry. No sooner said than done. In due course she was Mrs. Denison, and broke a solemn vow that she never would teach girls St. Matthew.

Like coquettes in general, who have had their fling at the proper time, she makes a pretty good wife; but she has one fault—she is too hard upon girls who flirt.

Mr. Ashmead flourishes. Besides his agency, he sometimes treats for a new piece, collects a little company, and tours the provincial theatres. He always plays them a week at Taddington, and with perfect gravity loses six pounds per night. Then he has a "bespeak," Vizard or Uxmoor turn about. There is a line of carriages; the snobs crowd in to see the gentry. Vizard pays twenty pounds for his box, and takes twenty pounds' worth of tickets, and Joseph is in his glory, and stays behind the company to go to Islip Church next day, and spend a happy night at the Court. After that he says he feels good for three or four days.

Mrs. Gale now leases the Hillstoke farm of Vizard, and does pretty well. She breeds a great many sheep and cattle. The high ground and sheltering woods suit them. She makes a little money every year, and gets a very good house for nothing.

Doctress Gale is still all eyes, and notices every thing. She studies hard and practices a little. They tried to keep her out of the Taddington infirmary: but she went almost crying to Vizard, and he exploded with wrath. He consulted Lord Uxmoor, and between them the infirmary was threatened with the withdrawal of eighty annual subscriptions if they persisted. The managers caved directly, and Doctress Gale is a steady visitor.

A few mothers are coming to their senses, and sending for her to their unmarried daughters. This is the main source of her professional income. She has, however, taken one enormous fee from a *bon vivant* whose life she saved by esculents. She told him at once he was beyond the reach of medicine, and she could do nothing for him unless he chose to live in her house, and eat and drink only what she should give him. He had a horror of dying, though he had lived so well; so he submitted, and she did actually cure that one glutton. But she says she will never do it again. "After forty years of made dishes, they ought to be content to die; it is bare justice," quoth Rhoda Gale, M.D.

An apothecary in Barford threatened to indict this Gallic physician. But the other medical men dissuaded him, partly from liberality, partly from discretion: the fine would have been paid by public subscrip-

tion twenty times over, and nothing gained but obloquy. The doctress would never have yielded.

She visits and prescribes, and laughs at the law, as love is said to laugh at locksmiths.

To be sure, in this country a law is no law when it has no foundation in justice, morality, or public policy.

Happy in her position and in her friends, she now reviews past events with the candor of a mind that loves truth sincerely. She went into Vizard's study one day, folded her arms, and delivered herself as follows: "I guess there's something I ought to say to *you*. When I told you about our treatment at Edinburgh, the wound still bled, and I did not measure my words as I ought, professing science. Now I feel a call to say that the Edinburgh school was, after all, more liberal to us than any other in Great Britain or Ireland. The others closed the door in our faces. This school opened it half. At first there was a liberal spirit; but the friends of justice got frightened, and the unionists stronger. We were overpowered at every turn. But what I omitted to impress on you is that when we were defeated, it was always by very small majorities. That was so even with the opinions of the judges, which have been delivered since I told you my tale. There were six jurists, and only seven pettifoggers. It was so all through. Now, for practical purposes, the act of a majority is the act of a body. It must be so. It is the way of the world; but when an accurate person comes to describe a business, and deal with the character of a whole university, she is not to call the larger half the whole, and make the matter worse than it was. That is not scientific. Science *discriminates*."

I am not sorry the doctress offered this little explanation; it accords with her sober mind and her veneration of truth. But I could have dispensed with it for one. In Britain, when we are hurt, we howl; and the deuce is in it if the weak may not howl when the strong overpower them by the arts of the weak.

Should that part of my tale rouse any honest sympathy with this Englishwoman who can legally prescribe, consult, and take fees in France, but not in England, though she could eclipse at a public examination nine-tenths of those who can, it may be as well to inform them that, even while her narrative was in the press, our government declared it would do something for the relief of medical women, but would sleep upon it.

This is, on the whole, encouraging. But still, where there is no stimulus of faction or personal interest to urge a measure, but only such "unconsidered trifles" as public justice and public policy, there are always two great dangers: 1, that the sleep may

know no waking; 2, that after too long a sleep the British legislator may jump out of bed all in a hurry, and do the work ineffectually; for nothing leads oftener to reckless haste than long delay.

I hope, then, that a few of my influential readers will be vigilant, and challenge a full discussion by the whole mind of Parliament, so that no temporary, pettifogging half measure may slip into a thin house—like a weasel into an empty barn—and so obstruct for many years legislation upon durable principle. The thing lies in a nutshell. The Legislature has been entrapped. It never intended to outlaw women in the matter. The persons who have outlawed them are all subjects, and the engines of outlawry have been "certificates of attendance on lectures" and "public examinations." By closing the lecture-room and the examination hall to all women—learned or unlearned—a clique has outlawed a population, under the letter, not the spirit, of a badly written statute. But it is for the three estates of the British realm to leave off scribbling statutes, and learn to write them, and to bridle the egotism of cliques, and respect the nation. The present form of government exists on that understanding, and so must all forms of government in England. And it is so easy. It only wants a little singleness of mind and common-sense. Years ago certificates of attendance on various lectures were reasonably demanded. They were a slight presumptive evidence of proficiency, and had a supplementary value, because the public examinations were so loose and inadequate; but once establish a stiff, searching, sufficient, incorruptible public examination, and then to have passed that examination is not presumptive but demonstrative proof of proficiency, and swallows up all minor and merely presumptive proofs.

There is nothing much stupider than Anachronism. What avail certificates of lectures in our day? either the *knowledge* obtained at the lectures enables the pupil to pass the great examination, or it does not. If it does, the certificate is superfluous; if it does not, the certificate is illusory.

What the British legislator, if for once he would rise to be a lawgiver, should do, and that quickly, is to throw open the medical schools to all *persons* for matriculation. To throw open all hospitals and infirmaries to matriculated students, without respect of sex, as they are already open, by shameless partiality and transparent greed, to unmatriculated women, provided they confine their ambition to the most repulsive and unfeminine part of Medicine, the nursing of both sexes, and laying out of corpses.

Both the above rights, as independent of sex as other natural rights, should be expressly protected by "mandamus" and "suit for damages." The lecturers to be com-

pelled to lecture to mixed classes, or to give separate lectures to matriculated women for half fees, whichever those lecturers prefer. Before this clause all difficulties would melt, like hail in the dog-days. Male modesty is a purely imaginary article, set up for a trade purpose, and will give way to justice the moment it costs the proprietors fifty per cent. I know my own sex from hair to heel, and will take my Bible oath of *that*.

Of the foreign matriculated student, British or European, nothing should be demanded but the one thing, which matters one straw, viz., infallible proofs of proficiency in Anatomy, Surgery, Medicine, and its collaterals, under public examination. This, which is the only real safeguard, and the only necessary safeguard to *the public*, and the only one *the public* asks, should be placed, in some degree, under *the sure control of government* without respect of cities, and much greater vigilance exercised than ever has been yet. Why, under the system which excludes learned women, male dunces have been personated by able students, and so diplomas stolen again and again. The student, male or female, should have power to compel the examiners, by mandamus and other stringent remedies, to examine at fit times and seasons. In all the *paper-work* of these examinations, the name, and of course the sex, of the student should be concealed from the examiners. There is a very simple way of doing it.

Should a law be passed on this broad and simple basis, that law will stand immortal, with pettifogging acts falling all around, according to the custom of the country. The larger half of the population will no longer be unconstitutionally juggled, under cover of law, out of their right to take their secret ailments to a skilled physician of their own sex, and compelled to go, blushing, writhing, and, after all, concealing and fibbing, to a male physician; the picked few no longer robbed of their right to science, reputation, and Bread.

The good effect on the whole mind of woman would be incalculable. Great prizes of study and genius offered to the able few have always a salutary and wonderful operation on the many who never gain them; it would be great and glad tidings to our whole female youth to say, "You *need* not be frivolous idlers; you *need* not give the colts fifty yards start for the Derby—I mean, you need not waste three hours of the short working day in dressing and undressing and combing your hair. You need not throw away the very seed-time of life on music, though you are unmusical to the backbone; nor yet on your three C's—croquet, crochet, and coquetry: for Civilization and sound Law have opened to you one great, noble, and difficult profession with three branches, two of which Nature intended you for. The

path is arduous, but flowers grow beside it, and the prize is great."

I say that this prize, and frequent intercourse with those superior women who have won it, would leaven the whole sex with higher views of life than enter their heads at present; would raise their self-respect, and set thousands of them to study the great and noble things that are in Medicine, and connected with it, instead of childish things.

Is there really one manly heart that would grudge this boon to a sex which is the nurse and benefactress of every man in his tender and most precarious years?

Realize the hard condition of women. Among barbarians their lot is unmixed misery; with us their condition is better, but not what it ought to be, because we are but half civilized, and so their lot is still very unhappy compared with ours.

And we are so unreasonable. We men can not go straight ten yards without *rewards* as well as punishments. Yet we could govern our women by punishments alone. They are eternally tempted to folly, yet snubbed the moment they would be wise. A million shops spread their nets, and entice them by their direst foible. Their very mothers—for want of medical knowledge in the sex—clasp the fatal, idiotic corset on their growing bodies, though thin as a lath. So the girl grows up, crippled in the ribs and lungs by her own mother; and her life, too, is in stays—cabined, cribbed, confined: unless she can paint, or act, or write novels, every path of honorable ambition is closed to her. We treat her as we do our private soldiers—the lash, but no promotion; and our private soldiers are the scum of Europe for that very reason, and no other.

I say that to open the study and practice of Medicine to women-folk, under the infallible safeguard of a stiff public examination, will be to rise in respect for human rights to the level of European nations who do not brag about just freedom half as loud as we do, and to respect the constitutional rights of many million citizens, who all pay the taxes like men, and, by the contract with the state implied in that payment, buy the clear human right they have yet to go down on their knees for. But it will also import into medical science a new and less theoretical, but cautious, teachable, observant kind of intellect; it will give the larger half of the nation an honorable ambition and an honorable pursuit, toward which their hearts and instincts are bent by Nature herself; it will tend to elevate this whole sex, and its young children, male as well as female, and so will advance the civilization of the world, which in ages past, in our own day, and in all time, hath and doth and will keep step exactly with the progress of women toward mental equality with men.

THE END.

NORTHERN ISLANDS.

IN their relative position to the rest of the world, the group of islands that lie north of Scotland seem almost beyond the pale of civilization. They are commonly thought to be only rough, rocky, and barren. But a better acquaintance with the Orkneys and Shetlands removes this impression. When are seen the gigantic rocky cliffs, the secluded bays, still and smooth, the old ruins of Pictish and Viking days, the

is to be obtained of the Orkney Islands. In the distance are the towering heights of Hoy Island, the most southern of the Orkney group. It is not many miles away, yet so hazy is the air that the distance seems much greater. A small steamer leaves the pier at Thurso for the northward journey. The abrupt cliffs of Scotland themselves grow hazy in the distance as the still steeper, rockier, and more wonderful cliffs of Hoy

COAST SCENERY—ISLAND OF HOY.

cathedrals and palaces of centuries ago, we find much that is attractive as well as wonderful.

Thurso is the terminus of the railway in Scotland. Situated amid scenes of desolation, perched upon the bold cliffs of Northern Scotland, the old town looks lonesome and deserted. Walking out from Thurso to the cliffs against which the waters dash and send up a sullen roar, the eye looks out upon the troubled waters of Pentland Firth. Looking beyond these waters, the first sight

appear. As these heights are reached, even seasickness vanishes. Their beauty absorbs one's whole attention. They loom high and grand far above the passing steamer; they are bleak, clear-cut, cold, against the leaden northern sky. The peaks rear themselves isolated, barren, serving only as the home of wild birds, the duck, and the gull. Eagles, too, build their nests in their craggy tops. The air is often black with this bird population. Some of the cliffs rise perpendicularly from the water's edge. Against these the

STROMNESS, ORKNEY.

darker waters dash themselves with a dull, thunder-like roar, sending up great white showers of spray that wash the cliffs, and then rush in rivulets back again to mother ocean.

Into some of the caves, that never seem to have an end to their black depths, the waves surge and rush, sending forth a dull, mournful roar that blends with dismal cadence to the sound of dashing waves.

Before we explore the islands, their history claims our attention. What attractions could they have offered that Picts, Norse, and even Scottish earls should have left their homes to found new realms upon them? First came the savage, brutal Picts.

MAP OF THE SHETLAND AND ORKNEY ISLANDS.

What they did, the wars they fought, and the lives they led, mythology and history do not inform us. Some remains of what industry they had are still to be seen in the burghs or houses of stone still remaining in different parts of the islands. But it is not until the tenth century that we have much light thrown on the islands' history. In that century, Harald of Norway becoming unpopular by oppressive acts, his people left him in great numbers. Some of these blue-eyed, light-haired, and sturdy adventurers settled in Scotland, and even far-off Iceland, but others came to the shores of Orkney. Of their wars, victories, feats of danger and daring, the sagas of Eglis tell. Laughing "at wind and storm," never so happy as tossing upon the angry waters of the sea, their part in Orkney's history is interesting and wonderful. But their independent rule was of short duration. Old Harald landed soon after, and by successful battles subdued his wayward subjects, and placed his own officers as rulers over the newly conquered lands. These new rulers are the Norse jarls, and they too have their lives told in their sagas. In still later years, by a marriage of some Scottish king with a Danish princess, the islands became the property of Scotland, and, later, the Scottish earls were the Orkney rulers. These earls have an unenviable reputation. Cruel, and living only for their own ends, they soon were forced to fly for their lives. At Scotland's union with England, the islands became the property of Great Britain. Ever since then, under good government, the islands have grown in riches and plenty. Each race has left some remains: the Picts have left their houses, the jarls their sagas and cathedrals, the earls their palaces, and the later rulers their forts.

The islands, great and small, composing the Orkney and Shetland groups, are some thirty or perhaps forty. The "Orkneys" are a collection of about fifteen islands, and the "Shetlands" consist of nearly twenty or

twenty-five. Separated by many miles of sea, these two groups are yet connected by ties of friendship, government, and common pursuits. Of the Orkney group, the island of Hoy is, perhaps, the grandest of them all. It is a mountain island, consisting of three distinct peaks. Between these high and rocky summits are damp, dark, and mossy ravines or valleys.

One of the highest peaks of the three composing the island is Ward Hill. Upon its northern slope is the so-called "Dwarfie Stone." In some age long since passed, and by some physical action, this great block of sandstone became detached from the overhanging ridge of the same material, and rolled down to the spot it now occupies. Perhaps thirty feet long and six feet high, it has been hollowed out so that the inside forms a sort of house. It is evident that iron tools must have been used, their marks

"I have fixed my eyes on the Ward Hill which rises above the gloomy valley, and have distinguished among the dark rocks that wonderful carbuncle, which gleams ruddy as a furnace to them who view it from beneath, but has ever become invisible to him whose daring foot has scaled the precipices from which it darts its splendor." But good old Dr. Wallace takes it rather to be some "water sliding over the face of some smooth rock which the sun shineth upon and causeth the spectacle." Whatever it may have been, whether spirit eye or shining water, it has long since disappeared. There is but one house upon Hoy, and that belongs to some keeper of a light-house.

From the hill of Pomona Island may be enjoyed a scene worthy many miles of travel. In every direction islands of all shapes and sizes stretch away and mingle with the waters of the cold North Sea.

THE DWARFIE STONE, HOY.

being plainly seen. At each end of the curious apartment is a bed of stone—a couch, rather. The entrance is by a doorway two feet or more high. Tradition asserts it to have been the residence at one time of Trolld the Dwarf. Trolld was the god of Norse mythology. It is thought that he occupied one couch and his wife the other. Sir Walter Scott remarks that whoever did live here must have enjoyed

"Pillow cold and sheets not warm."

Scott also conjectures that it may have been a temple to the northern Dii Manes.

It is one of the favorite traditions of the Orcadians that at one time there was a "glittering carbuncle" shining at certain hours on the summit of Ward Hill. Norna, the wild woman of these islands in Scott's *Pirate*, says that sitting at the side of the Dwarfie Stone, "Lewn by no earthly hand,"

Peat-bogs, broken here and there by patches of brown heather, give a brown, dull color to the scene. In the distance, indenting the shores, are quiet bays, reflecting in their placid waters the rocky cliffs protecting them. Over some more level tract of shore the waters flow far inland, forming secluded inland lakes. No trees are to be seen. There are few fresh patches of green. The few houses are rude and small. In the distance the town of Stromness may be seen nestling on the shores of Stromness Bay.

The harbor of Stromness is formed by a projecting arm of the island of Pomona, the island of Græmsay, and a northern projecting headland of Hoy. The town itself has a quaint, Normandy look. Landing at one of the small stone piers, one walks into a nest of curiosities. The one street runs in a zigzag line through the centre of the town. From it crooked alleyways run at right angles.

The houses themselves are of heavy stone, with gabled roofs, deep-set windows, and projecting turrets. However long one may stay at Stromness, he will never see any signs of excitement. The shop windows, filled with odd collections of fancy goods, always look undisturbed. The narrow street, paved with flat flag-stones, is always quiet. At rare intervals an ungainly, large-wheeled cart and pony come lumbering along, filling the street to the utter exclusion of

why they were placed, will never be known. Immense blocks of stone, fifteen or more feet high, they form the outline of a semicircle. As remains of Dru-

THE STANDING STONES OF STENNIS.

foot-passengers. Even the boys of Stromness, hardy-looking youngsters, in their rough homespun clothes, do not seem to act like boys of warmer climates. They lazily fish or stare at passing strangers, but never seem to make noise enough to disturb the stillness of the streets. The women, too, passing with their short skirts, bare arms, heavy stockings made at home, and wooden shoes, are of that happy, contented appearance so well suited to the general contentedness of the town. It is a quaint sight to see the women and girls of Stromness, or the neighboring town of Kirkwall, meet around the public fountain at evening. They perch themselves upon the bowl's edge, and jabber over the week's gossip; the long summer twilight softens the scene, and with sleepy town, bright faces, and mellow light, the picture is one long to be remembered. At some remote year in the history of Stromness her inhabitants were wont to smuggle goods into their homes. All such practices have disappeared now; but the under-ground passages, the piers, the houses so near the water, these all remain, and tell the story. Stromness, too, claims itself to be the home of "Torquil," Lord Byron's hero. Cleveland, the pirate of Walter Scott, also lived here, and even the character of wild Norna was taken from a lonely old woman of the town who used to sell favorable winds to departing fishermen.

Rainy days are common during some months of the year among the Orkneys. It was on one of those wet, dull days that I first saw the Standing Stones of Stennis. A few miles north of Stromness is the Lake of Stennis, connected with the sea by a narrow outlet; it rises and falls with the tide. The natural Bridge of Brogar divides the sheet of water into two parts, that of Stennis in the north and Harray in the south. It is upon the narrow bridge that the stones are still standing. Through the wet and damp they loomed grandly before us. How many centuries they have stood there, who placed them in their present position, and

id or Scandinavian ages they have no equals. They are like giant sentinels. Gray moss clings to them, making them look older still. It was among these that Minna and Cleveland met. Scott has described them minutely, and has thrown the charm of fiction over them. Within the circle is a fallen stone, which was used as an altar of sacrifice to Odin. Near it is an upright stone perforated with a hole. Through this, loving couples used to join hands and take a solemn oath of constancy, or the "promise of Odin," as it was called. This custom, I am told, is still prevalent among the lower classes.

Throughout Orkney are to be found tumuli. It is near the Standing Stones that the largest tumulus is found. This is Maeshowe. Conical in shape, and nearly ninety feet in diameter, and thirty or more high, it resembles some abrupt rising of the ground. It is only within the last few years that an entrance has been discovered to the interior. Entering a narrow passage some fifty feet from the tumulus itself, one at last enters the square chamber of the interior. The floor and sides of the chamber are composed of large flat slabs covered with hieroglyphics. Maeshowe is said by some to mean "Maiden's Mound." Others imagine it to have once been the tomb of the rulers of Scandinavian times. From the central chamber low passageways lead to other chambers. It is a curious monument, with its Runes and figures telling the story of early ages.

Leaving Maeshowe and the gray stones

behind, a highway winds along by shore and lake to the old town of Kirkwall. Passing tumble-down houses, now by the side of some remain of Piet or Norseman, one comes at last to the town. A bend in the road shows it for the first time. Like Stromness, it clings to a hill-side. Before the town is a secluded bay. Overlooking the town, towering above all other buildings, is the old cathedral, the pride of Orkneymen. In the distance could be seen the islands of the group, the blue waters of the North Sea, and the hills beyond. Kirkwall is very old; it bristles with antiquity. Under the old Norse rule it enjoyed certain privileges. Boasting of cathedral, royal charter, and antiquity, the average townsman is full of importance. In Kirkwall are to be found the general characteristics of Stromness. These are the curiously built houses, the narrow streets, the fountains, and the short-skirted women. Within its inclosures are palaces in ruins, churches, old gateways.

The cathedral is the most interesting thing in Kirkwall. It is a venerable pile. Of heavy Gothic order, it is grand and solemn in its style. The roof is high and vaulted, resting lightly on massive Saxon pillars now chipped and broken, dim and dirty. Through the large Gothic window the light falls upon the great paved floor,

of many a stately jarl and bishop. Within its gloomy aisles, under its carved tombstones, repose the bones of King Haco and his fair Maid of Norway, Margaret. Reared as an atonement for the murder of St. Magnus, it has for many centuries witnessed the successive rules of Norse, jarl, and earl. St. Magnus Cathedral is not the Duomo, or St. Mark's; but amid the small houses of the North it looms up almost as grandly as Giotto's masterpiece.

A short distance outside the town is Whitford Hill. A narrow cart path leads to its heath-covered summit. The higher one goes, the broader and grander becomes the view. On the opposite hill-side is the town; beyond, to the left, the sheltered bay and distant ocean. All the islands of the group, with the swift currents dividing them, look like floating patches of green and brown, and rock upon the blue cold waters of the German Ocean. Far to the southwest are the bold and towering headlands of Hoy. Sunshine and shade touching the bays and ocean and lakes form ever-changing pictures. The signs of life to be seen in the town below, the sound of the distant chimes in the tower of St. Magnus, and the white sails of the ships dotting the waters of the ocean, form a picture of quaintness that lingers for a long time in one's mind. It was to this hill

TUMULUS OF MAESHOWE, ORKNEY.

lighting up the crumbling tombs of the dead Orcadians, and showing the ravages of time on every cornice and crumbling tombstone. A small portion of the cathedral has been portioned off, and is used for Sunday services. The ancient doorway, ornamented with flutings, pillars, arches, and carvings, is now chipped and scarred. Like the cathedral at Glasgow, it escaped the ravages of the Reformation, and now overshadows the remains

that Cleveland, Scott's pirate, and Jack Bunce, his companion, went that they might avoid the crowd in the town below.

Not far from St. Magnus Cathedral are two crumbling ruins. When the islands came under the rule of Scotland, the king appointed earls to be the rulers of the islands. Abusing their power, they so treated the Orcadians that, for their own safety, they were compelled to build castles of great

strength. Behind these walls of stone they thought themselves secure from harm. One of these ruins is called the Earl's Palace. Both this and the Bishop's Palace near it are very picturesque. The thick walls are

grown ruins of a fort built by Cromwell. On Mayar Island is shown the spot where St. Magnus was slain. Scott, having visited the Orkneys, tells of a peculiar primitive Norse race inhabiting one of the small dis-

ST. MAGNUS CATHEDRAL, KIRKWALL.

slowly crumbling away; there are great gaps in them. Grass and dirt cling to every crevice, and the rooms, now roofless and exposed, are the homes only of birds. In the Bishop's Palace King Haco died. The Earl's Palace is a monument to the tyranny of Earl Patrick Stewart. It is by far the most perfect ruin of Gothic art in the Orkneys. It still shows signs of ancient grandeur. Forming three sides of a square, it is a massive collection. A crumbling flight of stairs leads to the banqueting hall. It is a roofless room. In the centre is a fire-place, telling, by its ample proportions, of ancient hospitality; the mantle is carved, and supported by Gothic pillars. At one end of the hall is a Gothic window; some of the delicate traceries yet remain. From this room winding stairs lead to turret chambers with great windows and hospitable window-seats. In the cellar, a damp, mouldy place, are the dungeons into which Patrick was wont to force unruly subjects.

But Pomona, Hoy, Stromness, and Kirkwall are not the only places of interest among the Orkney group. Boats of all descriptions, from a small steamer to a crazy yawl, may at all times be had, and excursions are made from Kirkwall Bay to the distant islands. On nearly every headland or lonely isle will there be found some ruin of ancient days. On the headland of Pomona, stretching out into the bay, are the grass-

tant islands. A reverend gentleman once began to read to the inhabitants Gray's "Fatal Sisters." After listening patiently a while, they interrupted him, saying they knew the song well in the original Norse.

The Orcadians live a quiet, uneventful life. Fishing, sheep-raising, and other similar pursuits provide them with the necessities of life. They are a people generally well educated and conscientious.

The dissipation of the Orkney, and even Shetland, people culminates every year in the great fair held at Kirkwall, called the fair of St. Olla. Commencing on the 3d of August, the festivities extend during several weeks. It is to this that all the people of the neighboring islands come. It is of great antiquity, deriving its name from Olave, a monarch of Norway. Olave introduced Christianity into the islands. On such days as the fair is held the scenes around St. Magnus Cathedral are animated and odd. The rough-looking fishermen, with their families, come from far-off islands in their yawls. Young girls and men, dressed in all sorts of odd homespun goods, crowd about the clown and acrobat with staring eyes and gaping mouth. Lifting tests, sleight of hand, shooting, and many other sports turn the usually placid Orcadian into a raving, dancing, excited Frenchman.

It was with almost a lonesome feeling

that, one warm, sunny day in August, I left the little quay at Kirkwall, and, standing on the little steamer's deck, looked for the last time at the clustering town, the cathedral tower, and the hill of Whitford and distant peaks of Hoy. Winding out among the low-lying islands, past ruined castles and crumbling Pictish houses, we gradually left the Orkneys behind us, and turned our faces toward the distant Shetland Islands.

About midway between Orkney and Shetland the great bare, precipitous cliffs of Fair Isle rise gradually into view. To look at the frowning sides of this lonesome isle, the thought of its being inhabited seems incredulous. As the steamer approached, innumerable little boats, holding only one person, and having sharp-pointed ends, darted from out the shadow of the rocky cliffs, and gathered in a bunch directly in the ship's course. Huddled there together, it seemed as though the ship would bring destruction to them. When at last we were among them, they cried to us to throw over-board papers or books. Some of us threw our last supply of papers, and then watched the quick little boats as they darted about gathering the treasures.

There are many tales told by the natives of the vessels that have been wrecked. In one of the fissures of the island is still to be seen the hull of a German vessel wrecked in 1868. Fair Isle does not deceive one by its first appearance. Rocky at first sight, a more thorough acquaintance does not bring to view any secluded spots of verdure. It is one solid rock, and how the hardy little people live is a mystery. By fishing they manage to support life through the summer, but

when the winter comes they are compelled to have supplies sent from the main-land. On the solitary headlands of the island the Vikings used to light their signal-fires.

Leaving the isle, we passed on, until at last, just at sunset, the dim, dark outlines of the Shetland Islands appeared. Sailing through the tempestuous waters of the swift current dividing Fair Isle from Shetland, called the Sumburgh Roost, we came at last into the still, smooth waters protected by Sumburgh Head. The first appearance of Shetland is dull, cold, and bleak. The islands composing the group are destitute of trees, shrubs, and grass. Great cliffs of crumbling mica or sandstone tower to great heights, their bare sides broken by no clinging trees or shrubs, deserted except by the duck and wild fowl of this northern clime. Before reaching Lerwick we often sailed through passes so narrow we could almost throw a stone to either shore. The Sumburgh Head is perhaps the grandest peak of rock in the islands. Seven hundred feet high, it rises almost perpendicularly from the water.

So swift is this current of the Roost that the slightest wind blowing against the course of the tide forces the waters into great commotion, so that they run mountain high, and beat upon the Sumburgh Head with cannon-like roar, sending up great showers of white spray.

Leaving Sumburgh Head, we coasted along toward Lerwick. The cliffs were all of fantastic shapes. In some of the steep sides were dark and gloomy caves. On almost every peak there perched the weather-beaten, ruined home of some early settler.

BISHOP'S PALACE AND CATHEDRAL, KIRKWALL.

WRECK IN FAIR ISLE.

It was well into the night when we came to Bressay Sound. Although not dark, yet lights were glimmering from the windows of the houses in Lerwick, resting on the shores of the safe harbor. As we at last dropped our anchor and sounded the cannon, innumerable boats, with lanterns at their prow, pushed out from shore and surrounded us. They pushed and surged about, each one anxious to make a few pennies by taking us or our luggage ashore.

On the hill-side rising from the north shore lie the clustering houses of the town of Lerwick. Like the towns of the Orkney Islands, it is a curious jumbling together of low, gable-roofed, small - windowed houses. The general air of the place savors of the Low Countries towns. The short-skirted women, with white frilled caps, heavy clothes, and often wooden shoes, almost astonish one when they speak English instead of Dutch. Over the winding, crooked street with the great paving-stones the veritable Shetland

ponies clatter along, and the carts lumbering behind them make a dull rumbling. It is on market days that Lerwick dons her holiday dress. The little quays, privately owned, and jutting out into the waters of the bay, are alive with men, women, and children. It is the custom on such days for people of the neighboring islands to enter their boats, and, with their cargo of peat, set sail for the town. Often there will be great numbers of these well-laden boats entering the harbor, and swarming around the piers like bees about a hive. The women leap from the boats, and slinging the basket of peat over their shoulders, start off for the nearest shop, that they may barter for this and the other. The men,

left behind, clothed in rough tarpaulins and odd homespun clothes, lazily fasten their boats, and pass the news with their friends. But not only do visitors come from seaward. From the central part of the island—from the regions of solitude and peat-bogs—numberless troops come winding over the hill behind the town, down the slope, to the market-place. It is a quaint sight to watch them. The little ponies, shaggy of mane, and with long, handsome tails, are heavily burdened. They have no bridle, only a string about their neck; on their backs are pack-saddles, often so covered with bags of peat, or per-

BRESSAY SOUND.

haps grass, that the pony is scarcely to be seen at all. If by chance, after all the goods are crowded upon the docile animal's back, one small portion of the rump appears, the good woman, his master, leaps lightly on, and away goes pony, bags, and woman to the town beyond. When this collection of ponies, men, women, and children is seen together, the sight is very picturesque. All look so odd, are so animated, that one long

I have often been asked, "How do these people live? what can they do with this rocky, barren waste?" Well, they do not need as much as some other people; their wants are simple, easily satisfied. Every class has different means of living. There are the peat-women, the sheep-raiser, the fisherman, the shop-man: all these have different wants, and lead different lives. The Shetland hosiery is world known. Children

remembers it. After the day's trading is over, away go the boat-loads, singing and laughing, the women pulling the stronger oar. Over the hill the long file of ponies and riders wend their way homeward.

Our accommodations at Lerwick were of a rather romantic description. The town boasts of a hotel, but a more inhospitable home could not be found. Becoming disgusted, I left, and at last found a new home. On a cliff, overlooking a bay and the North Sea beyond, a stone cottage had been built. The worthy matron, for a consideration, gave me the front-room. The traits I have noticed in that family may be taken to be the traits in a majority of the families. Kind, patient, always ready to laugh with the merry or cry with the distressed, they are hard-working and contented. In this far-away island they knew even of our colleges and our poets. Emerson, Longfellow, and Lowell they knew well, and a more kindly feeling than these people have for us can not be found. The people of the town are industrious and well off. Some of the cottages boast of elegance. Built of stone, surrounded by flower gardens sheltered by walls of stone, they can look from their windows over the town below, and out upon the water. On Sundays during service the streets are deserted, the churches full.

SUMBURGH HEAD, SHETLAND.

are taught the art of knitting almost before any thing else; and the socks, shawls, and veils manufactured by the knitting women of Shetland are sent south in large quantities. Some of the shawls are of such fineness and beauty that they grace the shoulders of noble ladies. It is an art carried to greater perfection here than any where else. The fisherman and the sheep-raiser are quite prosperous. It is in the shop-man or the merchant that we find the most flourishing class. Some of the merchants are rich, looking at riches from the Shetland stand-point. They own neat shops, pretty houses, and lead contented, prosperous lives.

The houses of the poor classes, those living outside and back from the town, are of the rudest and most miserable construction. When it is desired to build, a trench is dug about a square tract of ground, and from these trenches are built rude walls to the height of perhaps six feet. The crevices and holes are plastered with mud. Over the inclosed space, and resting

LERWICK, SHETLAND.

on the four walls, is placed a thatched roof of straw, with coatings of earth, and covered with stones to keep the whole from being blown away by the heavy gales that often sweep across the island. The interior of these huts almost beggars description. The only light is that from the open door or the square-cut hole in the roof. The last-mentioned opening serves for the chimney as well. Entering one of these miserable houses, the stranger is almost incredulous when told that in this one room live often a whole family.

On a damp and dismal day we mounted our ponies and rode through the rain and mist to Scalloway. Although called a town, Scalloway is really only a small collection of rude houses, having but one attraction, and that the old castle left by Patrick Stewart. It overlooks the bay upon which the town is situated. Its roof is gone, its walls gaping and falling, and the whole is desolate and deserted. On one of the high walls an iron ring is still seen, and it is said that from it rebellious subjects of the cruel Patrick were suspended. From any of the

COMMERCIAL STREET, LERWICK.

SHETLAND HUTS, NEAR LERWICK.

walls of this deserted home of tyranny there can be seen the distant island of Burgh-Westray, supposed to be the one on which lived the worthy Magnus Troil. There is a peculiarity about the poorer classes of Shetland hardly equaled by any race—the belief in the supernatural and curious. It is said that in the more remote islands there are people still believing in sea-kings and dwarfs. Almost every peak and headland has some story connected with it of sorceress or elfin goblin. They often weave their poetical imaginations about ordinary objects—the caves, the cliffs, the distant ocean, and the deserted moors—that even to a stranger and a southerner have a sort of fascinating interest. In these lonely isles live those who have only dreamed or read of southern verdure. In telling them of trees and vast green meadows, they listen with the same kind absent-mindedness that we listen to the stories they tell of this and that point. I know not what the impression would be upon the mind of a Shetlander were he suddenly transplanted to the green fields of Scotland or England, but one can easily imagine him almost dumb at so great a change.

One of the most interesting excursions from Lerwick is to the "Holm of Noss" and the cliffs of the island of Noss. To reach these great natural curiosities a boat is taken at Lerwick, and a trip made across the harbor to the opposite island of Bressay. This island forms the southern protection of Bressay Sound, and, like the neighboring island upon which Lerwick is situated, is barren, rolling, and hilly. Landing on the beach, and firmly fastening the boat, we pushed on afoot over the peat-bogs and hills. The way is a narrow cart path. As some high elevation is reached, the distant view of ocean, town, and bay forms an interesting picture. The shores of that part

of the island farthest from Bressay Sound drop nearly perpendicularly to the waters of a swift, turbulent current dividing Bressay Island from that of Noss. Near the point at which an embarkation is made for Noss Island is a remain like the tumulus at Maeshowe. It is said that the interior of this monument is fashioned somewhat like that of Maeshowe, but the entrance has long since been blocked up. Near here also is a cottage embodying all the worst principles of the huts of Shetland. In this old and dilapidated house an old man, alone in the world, is living his lonely life. By the second boat the island of Noss is soon reached. This island, small,

SHETLAND PEAT-WOMAN.

SHETLAND PONIES.

and with the everlasting cliffs, has but one house upon it to break the wildness of its appearance. As the boat grounded on the shore, the keeper of the island, with his children, ran down the steep slopes to meet the welcome strangers. So swift is the current of the strait dividing these two islands of Bressay and Noss, that often for weeks at a time the one family of Noss are prisoners on their secluded island. Ponies are raised in great numbers on the island. As we proceeded, herds of the hardy little animals ran before us. There were also multitudes of rabbits. They burrowed every where, and are frightened from their hiding-places in scores. Noss Island rises gradually from the part nearest Bressay to a great height, and then, dropping suddenly, forms a strong bulwark to the angry waters of the German

Ocean. To reach the summit of the island is a hard climb. Gradually nearing the summit, the view broadens. Bressay and the Mainland are behind; Lerwick is hazy in the distance, the blue smoke of the peat fires almost hiding it from view. Beyond the town are the wild, dull hills. At the summit a rude cross has been erected as a landmark. Standing by the side of the wall protecting the ponies from falling over the precipice, we are seven hundred feet high. Looking back, there are to be seen the grazing ponies, the home of the island's keeper, and the zigzag path of our route. Climbing over the wall, we were upon a narrow shelf of rock. A dull roar came from the dashing waters so many feet below us. Dropping a stone, it fell, without once touching the side of the cliff, with a dull thud into

SCALLOWAY, SHETLAND.

the waters below. From the great height, ships were toys, gulls were flies, rocks a hundred feet high were too small to be noticed. It is a height almost beyond description. The waters seem calm and placid, yet we can hear them beat against the cliff. So great is the height that the tallest spires, the highest masts and cathedral domes, would not reach the summit.

Near this great cliff is another natural curiosity, called the Holm of Noss. Sailing along the cliffs of Bressay, past deep caves and natural arches of rock, the abrupt perpendicular cliff of the Holm is soon reached. By some convulsion of nature a huge fragment of Noss Island has fallen away, and now stands by itself, forming a steep, triangular mountain of rock. The top of Holm is rough and barren. In times past the northern birds, the eagles and the gulls, made the lonesome top their home. The deep fissure between the Holm and Noss is dark and gloomy. It is a hundred feet wide, yet so dark that it seems only a fissure. Into this the waves rush with a fearful echo, sending up great showers of spray from the dismal depths. Across the chasm, many years ago, a rope was thrown, and communication established between the two rocks. Now every trace of it has disappeared.

Near the Holm is the Orkneyman's Cave. Years ago a poor sailor, hunted by foes, hid in these black depths to save his life. An easy entrance to the cave can be made by a row-boat. Passing into its great black gaping mouth, the light of day is soon extinguished by the black depths within. How far inland the cave extends is not known, the passage becoming too small to explore. When the sun shines, by some curious freak of nature a curious spectacle is afforded those within the cave. The sun's rays are so reflected that all the colors of the rainbow are thrown upon the dark walls of the cavern, lighting up the gloominess with brilliant effect.

But a volume might be written of Shetland wonders. Each day brings something new. There are excursions to the northern part of the island, to the Drongs, great stacks of rock surrounded by water. One may also visit the Out Skerries, a group of fishing islands. St. Magnus Bay, too, is very grand, with its island rocks and high cliffs. But to tell of these is too long a tale. The Castle of Mousa, passed on the way from the Orkneys to Lerwick, is a remain of Viking days well worth a visit. It is a turret, mortar-shaped mass of rocks, the interior once having been inhabited. It is chiefly interesting as being a most perfect ruin of an early Pictish burg. In olden times, Erland, having carried off a beautiful princess, defied the avengers from this small castle.

While the Northern Islands have not

CASTLE OF MOUSA.

southern beauty, they have a grandeur of their own—the bluff high rocks with no clinging shrubs, the caves, the peaks, the deserted fields. All these, Shetland claims. What sights and years of war have these islands witnessed! The imagination almost refuses to believe that they are indeed the scenes of deeds older than those of history. It seems incredible that this castle or that ruined burg should have been standing since the days of mythology. The Cathedral of St. Denis, the Parthenon, and the Tower of London, all hoary with antiquity, are yet modern when compared with the Stones of Stennis and the Castle of Mousa, the Sphinx of Shetland.

DAWN.

THE lilies droop, the red rose pales;
The tender violet's perfume fails;
The birds are dumb, the leaves are still;
Night's dark shade infolds the hill.

O eyes so dim with unshed tears!
O heart whose pain through smiles appears!
Thy bitter cup of sadness fill,
For night and darkness hold thee still.

The clouds are gone, the sky is clear;
Night's shade has flown, the dawn is here;
Warm life and love the glad air thrill;
In golden sunlight laughs the hill.

The lilies raise their drooping heads;
Fresh fragrance steals from violet beds;
The rose with crimson blushes now;
The song-birds trill, the tree-tops bow.

Oppressed with fear, no light hath shone
My weary, tangled path upon,
While Time, with swift, remorseless tread,
Cried, "Youth and joy for thee are dead."

Sad heart, awake and greet thy morn;
Fresh life and light for thee shall dawn;
Through skies made clear by love's bright ray
Thou too shalt know the perfect day.

HUNTING WITH THE LONG-BOW.

The joy is great of him who strays
In shady woods on summer days,
With eyes alert and muscles steady,
His long-bow strung, his arrows ready.

At morn he hears the wild thrush sing,
He sees the wild rose blossoming,
And on his senses soft and low
He feels the brook-song ebb and flow.

Life is a charm and all is good
To him who lives like Robin Hood,
Hearing ever, far and thin,
Hints of the tunes of Gamelyn.

His greatest grief, his sharpest pain,
Is (when the days are dark with rain)
That for a season he must lie
Inert while deer go bounding by,

Lounge in his lodge, and long and long
For Allan à Dale's delightful song,
Or smack his lips at thought of one
Drink from the friar's demijohn.

But when the sky is clear again,
He sloughs his grief, forgets his pain,
Hearing on gusts of charming weather
The low laugh of his arrow feather.

I.—AMONG THE WOODPECKERS.

OF old, so runs the legend of the poets, a beautiful king of Latium, named Picus, went forth into the forest to enjoy his favorite pastime, hunting. We are told that he was dressed in most wonderful sporting garb, which consisted of a splendid purple cloak bound at the throat with a zone of gold. Through the sweet dusky aisles of the forest the young king saw flitting numberless beasts and birds, at which, no doubt, he hurled his whizzing cornel shafts as a lusty, sport-loving lord should. Circe, a woman of doubtful honesty, was, on this

very day, going about in the woods hunting for certain herbs, known to grow thereabout, possessing rare properties of great value to dealers in sorcery. Discovering a tuft of the desired plant (I know not whether it was snake-root or ginseng), Circe stooped, and was in the act of sawing it off with a case-knife, when, just beyond a persimmon bush, she beheld *Picus* standing up tall and beautiful, glorious with fine purple and sheeny with gold. It was, on the part of Circe, a case of love at first sight, and with her to love was to speak of it at once. It may have been leap-year. Howbeit, *Picus* indignantly spurned the proffered caresses of the woman, who thereupon slashed him across the head with a stick she held in her hand, to such effect that he was forthwith transformed into a bird which is to this day known as the woodpecker.

I have often thought that the wand of Circe must have brought the blood from the crown of the head of *Picus*, for how else will you explain the origin of the red tuft, that ever-present and unmistakable mark of the woodpecker family? From the demure and quiet sap-sucker up through all the species to the great black woodpecker, this blotch of blood-red feathers is found. A mere dot in the case of the smallest species, it spreads all over the head of the white-tailed variety, and rises into a magnificent scarlet plume on the crown of the *Hylotomus pileatus*.

To me the woodpeckers are the most interesting of all the American birds. I never tire of studying them. Obtrusive, inquisitive, self-important, knavish, bellicose, and noisy, the white-tailed variety is, perhaps, the most sprightly as well as the most versatile spirit of the woods. He attempts every thing with an air of the most presuming impertinence, and what he can not accomplish in the way of attainments generally thought necessary to a well-cultured bird is, simply to sing a good song.

There are as many as four kinds of woodpecker improperly called sap-suckers by our people. The speckled bird of the Southern pine forests, nearly allied to the *Picus pubescens*, or downy woodpecker, of our Northern States, is universally called sap-sucker by the Southern people, while two varieties of the hairy woodpecker, the downy woodpecker, and the *Centurus carolinus*, or true sap-sucker, are all known in the North by the one name—sap-sucker.

You have often noticed the trunks and limbs of your orchard and ornamental trees perforated with ring after ring of conical pits, arranged in a very orderly way, sometimes from root to top in close array. These are the dinner pots of the unique quiet bird properly named sap-sucker. The naturalists call him *Centurus carolinus*. He is the red-bellied woodpecker, the soberest, quiet-

est, and most strictly attentive to his business of the whole family.

It is amusing to watch one of these sap-suckers, after he has made his pits in one of your trees, going slowly round from one to another sipping the rich nectar therefrom, seeming to enjoy this liquid fruit of his toil in a most satisfactory way, at the same time keeping a lively look-out for the approach of an enemy.

The flicker, or golden-winged woodpecker (*Colaptes auratus*), erroneously called yellow-hammer, is a pretty bird, often seen drilling away at old logs and stumps in search of the larvæ of various insects. Next to the "white-tail," he is the commonest variety of American woodpecker. The "white-tail" is the flicker's evil genius, making it his special business to annoy him in every possible way—a proceeding as much enjoyed by one as it is dreaded and detested by the other. I once had an opportunity to watch a series of assaults made by a pair of "white-tails" trying to get possession of a flicker's nest while the latter was inside the hole. The "white-tail" had taken position just below the opening, where he began to drum away lustily in order to induce the

WOODPECKER AND OWL.

flicker to poke out its head. No sooner did the beak of the latter appear, than the former attacked it as if in a real frenzy of rage. Day after day this sort of siege was kept up almost constantly, till finally the flicker abandoned her nest, and the "white-tail," taking possession, cleaned the place out,

built therein, and reared a brood in triumph.

The flicker is the only bird of the woodpecker family fit for the table. When young and fat, he is juicy and sweet, though extremely dark and rather tough, with a high game flavor. I have killed numbers of them

up again and jeer at you when the danger is over. Bah! you can't hit a "white-tail."

The yellow-bellied woodpecker (*Sphyrapicus varius*) is a beautiful little fellow everywhere to be seen in our woods. He, together with the hairy and downy varieties, has furnished me many a day's exquisite sport,

1. PICUS PUBESCENS. 2. FLICKER.

late in the fall while they were feeding on the berries of the black-gum-tree. They eat very little grain, and are not at all a farm pest.

The "white-tail" is the only bird on which I have practiced archery that can successfully dodge a well-directed arrow. He is sharp-sighted, alert, and extremely active. You see him perched, high and fair, on a limb, and draw your bow. He sits quite still, his eye fixed keenly on you. You let fly; but no sooner does your string twang than he has flipped behind the limb, and is entirely invisible. Your shaft whisks past him, and immediately he mounts to his original perch, beginning to duck his red head and chatter at you. This exasperates you. You let drive at him again; but over he goes before your arrow reaches him, to pop

though, to tell the truth, I have never killed more of them than I needed as specimens for examination.

By far the noblest bird of the Picus family in the United States is the great black woodpecker (*Hylotomus pileatus*), which has already disappeared from the Western woods, and is becoming rare even in the vast forests of the South. When at rest, his body appears quite black, while his head has white stripes about the eyes, and is surmounted by a long tuft of brilliant scarlet feathers. When he takes to flight, which he does with great vigor at the least alarm, his wings show a sprinkling of white, which relieves the dusky hue of his body.

The hill country of North Georgia, East Tennessee, and North Alabama is at present the place where the *Hylotomus pileatus* is to

be found in the greatest numbers. It was in Gordon County, Georgia, that I killed my finest specimens. I remember a most exciting day spent in the woods of the hilly "di-

whence the arrow had come, lit on a post-oak sapling scarcely twenty yards from our thicket. Will drew quickly, and let him have a blunt arrow; but it struck too far

MEADOW-LARKS.

vide" between the valley of the Oothcaloga and that of the Oostanaula—two streams whose confluence is a mile west of the town of Calhoun—on which day Will and I bagged three of these great woodpeckers. It was in December, clear, cool, magnificent weather, not unlike the Northern Indian summer, with scarcely a breath of wind. Early in the morning we entered the woody outskirts of the "divide," and were not long in finding two black woodpeckers, whose loud pounding reached our ears when several hundred yards distant. They were on an old log, busily engaged in pecking holes in search of larvæ. Will and I, as usual, were armed with nothing but our mulberry long-bows and our quivers full of arrows. We let fly from a pine thicket at forty yards, making a clear miss of it, but frightening the birds terribly. Their flight was short, however, and one of them, not knowing

back, only breaking one of his thighs, and sending him off on a crazy, winding flight. After securing our arrows, we gave chase. And now the sport began in good earnest. The bird belonged to whichever could give him the death-shot. I fear if I tell you that for two hours we raced after that bird, shooting at it no less than ten times each before at last Will bowled it over, you will smile at our archery. Will held his bird up by the wing and, while the sweat dripped from his forehead, yelled triumphantly. He was as proud of that woodpecker as ever Girard was of a lion, or Cumming of an elephant. I had the pleasure of bagging the second bird by a fine shot at sixty yards, striking him fair in the back with a barbed arrow, the shaft of which was a slender reed. The third bird was knocked from a dead pine stump by Will at thirty yards. These three are the only specimens we ever

took with the long-bow from the ranks of the great black woodpecker.

II.—OUT WITH THE LARK.

A plate of fried meadow-larks' thighs is something too exquisitely enjoyable to be left unmentioned in any writing or conversation touching the American starling (*S. ludoviciana*). No tidbit, not even the tip of a partridge's wing, can compare with the plump thigh of a fat meadow-lark. The meat is of a clear yellowish-white color, semi-transparent, tender, juicy, and richly flavored (if the bird has found its proper food), and is of a fine, soft, waxy consistency peculiarly grateful to the molars of the epicure. Indeed, nothing is so sweet and soothing, so suggestive of tender thrills of sensual rapture, as a lark's thighs, unless it be the lark's voice. Clear, quavering, delicately modulated, this voice is the sweetest in America. You may hear it falling from the high spire of a dead tree in the fields, or rising from the tufts of dewy clover, a half-melancholy, half-sprightly trill of four notes—*ee-ter-ree-er*, far-reaching, melodious, inimitable. Not even the mocking-bird can quote from or plagiarize the original score of the meadow-lark's simple music.

This bird is found throughout the United States east of the high plains, and is so common in our fields, and has such marked beauty of plumage, that few persons in this country have failed to notice it.

In size and general color it very closely resembles the flicker, or golden-winged woodpecker. Its color above is a dark, clouded brown, the feathers slightly tipped with brownish-white, and dashed with reddish-brown terminal spots. Its wings and tail have dark brown bars waved with lighter shades, and its breast is bright golden yellow, in which is set a pectoral, heart-shaped black spot or crescent. Its eyes are of a

yellowish cast, clear, quick, and bright. Its head is low and long, striped with yellow at the sides, and its bill is slender, almost straight, and one and a quarter inches long. The dead bird measures about ten or eleven inches in length, and sixteen inches in alar extent.

The meadow-lark feeds upon the ground, generally preferring open fields overgrown with weeds or grass, where it can be hidden from the eye of the hawk while it runs nimbly about industriously searching for insects, larvæ, small seeds, and the tender germs of up-springing grain. Though not very voracious or cruel in its disposition, it will sometimes kill and eat the helpless young of the field sparrow, and I once found one destroying a nest of new-born rabbits. It is a swift runner and a good hider, but its flight is slow and quivering, rendering it an easy mark for the gunner.

It builds its nest on the ground in a hollow scooped at the root of a tuft of grass. The nest is neatly woven of dry stems of grass, and roofed over with a flat arch of the same materials. The eggs, generally four in number, are white, with reddish-brown spots at the larger end. Many persons esteem these eggs a great delicacy, and thousands of nests are yearly robbed, in the Western and Middle States, by boys and men at work in the fields.

During the nesting season the male larks engage in fierce brawls and conflicts, chattering and fluttering around each other, striking savagely with their bills, and dealing vigorous blows with their wings. Both the males and females incubate, growing miserably thin before the eggs are hatched. About the time the young have learned to fly, they are fit for the table, and should be roasted and served with currant jelly, or their thighs rolled in paste and fried.

Nothing can be finer sport than shooting meadow-larks with the long-bow and arrows in the clover and timothy meadows after the grass has been cut. You want light pewter-headed shafts for this purpose, for generally you can not get nearer a lark than forty paces, and it is a fine shot to bowl one over at that distance. While a lark is feeding he occasionally gives out a short rasping note not unlike *tizthe*, which serves to draw your attention to his exact whereabouts, and if you are quick-sighted and used to hunting, you will soon discover him running along in the grass, or standing singularly erect in the midst of a tuft neglected by the mower. If his breast is turned toward you, it glistens and brings the crescent at his throat into fine relief—a beautiful target for your arrow. Like most birds that live in constant terror of hawks, the meadow-lark will often mistake an arrow hurtling past him for his most dreaded enemy, and skulk a step or two

LARK'S NEST.

and squat flat on the ground, till by a successful shot you have knocked him over, or till a shaft strikes so near him that he takes wildly to wing, evincing the utmost fright. I saw Will kill one at the fifth shot, sixty-two yards away, and I have not unfrequently emptied a quiver of ten arrows at a lark without hitting it or even starting it to wing, when not one of the shafts missed the bird more than a foot.

III.—IN THE HAUNTS OF THE WOODCOCK.

The woodcock, and especially our American variety, is a rare bird in several respects. His plumage is dyed in sober colors, of which brown, gray, and yellowish-rufous are the prevailing tints. Across the back of his head run three narrow stripes of black, alternating with as many yellowish bands, combining to make up a rather attractive semi-crest, so narrow that his eyes, sitting very high up on his head, almost touch each other. These eyes are wonderful orbs, combining in their expression stupidity, melancholy, half-blindness, and a sort of "liquid drollery," as I once heard a sportsman express it.

The woodcock haunts the outlying marshes of inland lakes and ponds, and is frequently found in the damp lowlands bordering our small streams. His food is earth-worms and larvæ of various kinds, which he takes by thrusting his bill, two and one-half inches long, into the soft earth where such things abound. The smooth holes thus formed often serve to make the sportsman sure he is near the resting-place of his favorite bird. I say resting-place, because the woodcock rarely works or moves about in daytime. It is when the sun has got well under the horizon, and the cool shades of night are settling over the earth, that he awakes from his long day-dream, and comes out from his hiding-place to begin laboring for his nightly food. His movements when thus employed are sprightly and energetic, and he uses his long, flexible bill with a deftness and precision only equaled by the shrewdness with which he avoids all his nocturnal enemies, among which the raccoon and horned owl are the most dreaded.

Woodcock-shooting with the long-bow and arrow is charming sport. I know nothing to equal it. But you must be keen of sight and a dead-shot to make it help your table any. In a word, you must be able to find your bird on the ground, and to kill him when you have found him, neither of which is an easy performance. Like most other wild things, the woodcock has a combination of colors peculiarly adapted to the prevailing tints of the places he haunts, and in such a way as to make him next to indistinguishable when at rest among the tufts of brown grass or heaps of fallen leaves generally found in such regions as he visits in

the shooting season. This causes the archer much trouble; but when after a long and careful search he descries the outlines of his bird, and by a well-sent shaft bowls him over, he is richly paid.

This power of rendering themselves next to invisible is possessed by the quail, the pheasant, the snipe, the rabbit, and a few other wild things. Nor is man alone deceived by it. I have seen a keen-sighted greyhound run round vainly looking for a common gray rabbit which had squatted in plain view on the smooth surface of a barn lot. Even the wonderful vision of a hawk is powerless to descry a quail when muffled and flattened out on a tuft of brown grass, and I have spent an hour watching a blue-tailed darter (the small chicken-hawk), which, perched on a fence stake, waited patiently for a field lark to discover itself by the slightest motion.

I remember a day's sport that Will and I had on the celebrated Devon farm of Richard Peters, Esq., that resulted in the death of seven as fine woodcock as ever went to table. It was in December, but, as is often the case in that latitude, the day was quite warm. We had been informed by a lad who had been shooting meadow-larks on the fine blue-grass fields of the beautiful farm above mentioned that he had seen some big snipes in a bit of wet land, and we at once surmised that these big snipes were really woodcocks. We hired the boy to go with us in the capacity of pilot, and a little after sunrise we were on the ground, with our bows strung and our quivers full of light blunt-headed arrows. The marsh was small, covering not more than three acres of land, and through its centre ran a small ditch stream trickling down to the Oothcaloga. A kind of rush or marsh sedge grew in heavy tufts all over the wet portion of the tract, and where the land was dryer, the blue-grass spread its emerald carpeting. Separating a little, Will and I at once began our search by slowly advancing into the damp area, scrutinizing every foot of land as we went. We had gone but a few steps when Will suddenly halted, glared for a moment into one of the sedge tufts, raised his bow, and sent an arrow whistling to the spot. A momentary fluttering sound as of a bird entangled in the grass, and then a woodcock rose rapidly from where I saw the arrow sticking, and wheeled away, uttering its sharp peculiar cries. Will had missed his bird.

Despite my efforts to the contrary, I at once became a little excited. How eagerly my eyes scanned every place where a bird might hide! How I was longing for such a chance as Will had just had! All at once my vision was blessed. Not more than thirty feet from me the brown outlines of a woodcock were barely distinguishable under the drooping fringe of a dead sod of wire-

grass. I stopped a moment to collect my nerves, drew my right hand across my eyes to clear my vision, settled myself firmly on my feet, raised my bow, and let drive. My shaft stood quivering in the very centre, but not a feather moved. I went forward and found that I had shot at and hit a clod of brown earth. I pulled up my arrow and glanced at Will. He was chuckling at my mistake. I forget just what I said. Presently, however, we had better luck. Will drew first blood and bagged the first game, and I followed suit. We soon began to have a fine time. We got all the birds up, and they scattered out and lit in the short grass of the surrounding pasture fields, whither we followed them, and dogged them from spot to spot, till four of them hung at Will's girdle and three at mine.

THE WOODCOCK.

Early in the spring large numbers of woodcocks stop for a week or two in the damp woods of Indiana and Illinois, and a few breed here, the larger portion continuing their migratory flight to the regions of the Northern lakes.

IV.—THE WAYS OF THE HERON.

Whoever has spent a summer day in loitering beside a somewhat secluded brook has most likely been startled by the sudden but not very rapid uprising of a huge bird, whose wings, stretching six feet from tip to tip, beat the air heavily and slowly, with a muffled rushing sound suggestive of great power. The body of the bird, as it gets fairly started in its flight, takes an attitude of dignified ease strangely contrasting with the awkward swaying of the long bony legs that dangle behind. The neck of the bird, slender and disproportionately long, is drawn into a graceful reverse curve, so that the head is supported by the body. This is the great blue heron, sometimes called blue crane. In appearance the heron is a sad, stately, solemn bird, and especially does the great blue American variety continually remind one of the classical fable touching its origin. The old poets have it that Ardea, a city, the capital of the Rutuli, situated a few miles south of Rome, was burned by Æneas, and that the heron was produced from the ashes. Any one poetically inclined, after reading this account as rendered by Ovid and Virgil, has only to steal quietly near where a great blue heron nods above a stagnant pool, and watch the lone bird a while, to become possessed of the idea the poets intended to convey; for the quiet, sad-mannered, grayish-blue bird, dozing dreamily, will remind him of a heap of smouldering

ashes and embers. But if the observer is near enough to catch the glint of the heron's eye, something of the bird's true character is at once understood. That eye is as clear and bright as a diamond, and is brimful of the light of shrewd intelligence and a wide-awake spirit. Let a small fish, or a newt, or a frog, approach that solemn, sluggish-looking sentinel, and down goes that long sharp beak as surely and with as deadly effect as would a sportsman's spear. The frog, or fish, or other victim,

is impaled, drawn from the water, and mercilessly mangled and devoured, after which the heron raises one foot, and draws a toe between its mandibles, like a philosopher picking his teeth.

Our great blue heron is the largest of the

family in America, excepting, perhaps, the great white heron of the South. It is voracious almost beyond comparison, and eagerly searches for and devours the young of the other varieties. It will also kill and eat young ducks. An instance of this came under my observation several summers ago while bass-fishing in a small stream in Indiana. I saw, not fifty feet from me, a very large blue heron savagely beating a half-fledged summer-duck against the sand at the water's edge, while the parents of the victim were swimming around near by in the utmost distress. Raising my bow, I drew an arrow to the head, and let fly, striking the blood-thirsty heron through the body, but a little too far back to kill him outright. He rose with great vigor almost vertically till above the timber, and then flew rapidly off, with my shaft sticking through and through him. The shot was doubtless fatal, but where that great heron died is unknown to me. The old ducks flew away, and on picking up their murdered fledgeling, I found it greatly mangled in the body, and one of its eyes was plucked out.

Our great blue heron generally builds its nest of large dry twigs in the top of a tall tree in the midst of some lonely and almost impassable swamp, or about the margin of a wooded pond.

The young of the great blue heron are excellent for table use, tender and well flavored. Let them be stuffed and roasted, and served with currant jelly or cranberry sauce. You will smack your lips over the dish, and declare it is almost identical with roasted hare.

The great white heron is the largest of the family, and is mostly confined to the far South, though I have seen it occasionally on the small streams of North Georgia. The only one I ever killed was on Cranetah Creek, a small tributary of the Coosawattee River. It was near a place where part of an old mill-dam remained, and what had been the mill-pond was now a dense thicket, through which the clear limestone water of the creek meandered and babbled in the shade. Will, who was then with me, first discovered the great ghostly bird perched on a bough of a small maple-tree, and suc-

ceeded, by a fine shot at forty yards, in striking it through near the tail with an arrow two and a half ounces in weight, which re-

HAUNT OF THE HERON.

maintained in the wound at such an angle that it interfered so badly with the bird's flight as to bring it flapping and floundering down through the bushes near where I was standing. I had broken my bow-string a moment before, and was busily engaged putting on another when the great white fellow rushed to the earth almost at my feet. A terrier dog belonging to the gentleman with whom we were stopping had followed me, and now he sprang at the heron in good style; but alas for that dog! the noble bird curved his strong neck backward, like an overdrawn bow, and let fly straight at the face of his assailant, striking him in one of his nostrils. The dog recoiled with a howl of pain, but almost instantly returned pluckily to the attack. The old heron received him gallantly, giving him a deep wound just above the eye, and another in that organ, destroying the ball. A blow from my bow broke the bird's neck and ended the fight. The game measured seven feet and five inches from tip to tip of its wings. This variety, like the great blue heron, frequently attacks the fish-hawk, and forces it to give up its prey.

I once saw a blue heron chase a fish-hawk until it dropped a large fish, which fell among some large pebbles on the bank of a stream. The fish, not being much hurt, began flipping and floundering about among

HERON'S NEST.

the stones, and the voracious heron pounced at it with such force that, missing it, and striking its beak against a pebble, broke its upper mandible, and so injured itself that I easily got within twenty yards of it, and bowled it over with a blunt arrow.

The commonest representative of the genus *Ardea* in America is the bittern (*A. vivivens*), a beautiful bird, generally called by a vulgar name, but also widely known as the "fly-up-the-creek," or brook bittern. Next to the kingfisher, it is the handsomest of our aquatic birds. Its body is small and delicately turned, its neck long and slender, and its legs extremely so. Its plumage is richly variegated with flakes of brown, yellow, purple, black, and white, while the prevailing tint is a bluish-gray, bordering on purple. It has a fine large head, decorated with a crest, and its wonderfully clear and expressive eyes give it a look of great intelligence; and yet so erect does it hold its body above its stilt-like legs when perched, and so vertically does it stretch up its fringed neck, that of all birds its appearance is to me the most comical.

V.—THE WOOD-DUCK AND HIS COMPANIONS.

Duck-shooting is, in its way, quite as delightful as duck-eating. But when I speak of duck-shooting, I by no means refer to those long beaches on the Chesapeake where the professional fowler crouches behind his screen and sends out his decoy dog; nor do

I hint of those wild, sunny, rush-lined reaches of water on the Florida coast where the sport in his skiff, and the negro gunner in his pirogue, slaughter their thousands every season. My reminiscences of duck-shooting are mostly of the interior of the Western and Southern States, and have in them something of the freshness of those sweet currents of air that follow the ways of the brooks and rivulets, and of those damp, delicious spots of shade under the swamp-elms where the wood-duck builds her nest. As I recall a hundred days of exquisite sport spent in chasing the teal, wood-duck, and widgeon, I hear the "quack, quack" of the startled birds and the silken rustle or the keen whistling of their rapidly moving wings, and mingling with these sounds, clear, distinct, characteristic of itself, the sharp hiss of a feathered arrow. Perhaps, after all, it is the long-bow and arrows that provide for Will and me the peculiar flavoring of our sport, and

serve to render the narrow rivers, rivulets, and brooks of the interior far more attractive to us than the bays and inlets of the sea-coast. Another thing is worth noting just here. The bowman, to be successful as a hunter, must learn to perfection the habits of his game. This necessity has given Will and me opportunities to see many things and note many habits peculiar to certain kinds of small game overlooked by other sportsmen and naturalists.

The golden-eyed duck, or whistler (*Clanula americana*), though not often found far in the interior, is one of my favorite birds, and a little incident involving the death of one may well serve to describe a singular habit (common to several species of American ducks), which I have never seen mentioned by writers on natural history or in the books on field-sports.

I had been for an hour or so following a dozen or more blue-winged teal (*Querquedula discors*) down a small stream, without so much as getting a shot. While creeping slyly along, close to the brook's edge, under cover of some small bushes, my eye chanced to fall on a whistler duck sitting quite still on the surface of a shallow inlet just across the stream from me—a distance of perhaps a hundred feet. I knew the teal were considerably farther down the stream, and considering the ill luck I had had with them, I was glad to take a shot at this lone golden-eye. I let fly an arrow with about eighty pounds force, without uncovering myself, and watched it through its almost instantaneous flight with satisfaction, for it started full for the mark; but just as it had almost struck the beautiful statue-like bird, the misadjustment of the feather caused the shaft to "flip," that is, to suddenly dart up-

ward, sending the pointed end into the sand at the bottom of the water directly under the game, leaving the arrow standing at an angle of about fifty degrees with the surface of the water. The duck took to wing promptly and swiftly, darting away through the woods that lined the banks of the stream. I stood for a little time silently anathematizing the action of my shaft, and was on the point of crossing the brook to secure it, when down with a whir came my golden-eye, and settling near the shaft, began to rapidly describe small circles around it on the water, eying it curiously, and all the time uttering a peculiar piping cry, not unlike that of a gosling. I had not expected this act of accommodation on the part of my game, and so was not just in

the frame of mind best suited to making a good shot. I sent a shaft singing straight across above his back, and into the water beyond with a low "chug," that started the bird again into a convulsion of flight. I now stood quite still, composing myself for a careful effort if he should dare to return again. I had not long to wait. With a whirring sound peculiar to the wings of this bird when flying, he came down like a bolt from a catapult, making the water foam where he struck, and again commenced his circular movement and his close and evidently terror-inspired examination of my first shaft, his crest bristling, his neck feathers ruffled, and his wings quivering. I let go another arrow, which struck him fairly through the body near the butts of the wings, killing him at once. Since then I have seen a green-winged teal (*Nithon carolinensis*), and once or twice a wood-duck (*Aix sponsa*), go through the same manœuvre. Every sportsman is well aware of the habit peculiar to ducks and geese of returning to a pond or other place whence they have been driven, and flying for a time in circles, as if to make a survey of the spot; but a duck in returning to an arrow invariably does it by a direct and exceedingly rapid flight. I have had opportunity to observe this habit or action but three or four times, and have no explanation to offer.

The blue-winged teal (*Querquedula discors*) is one of the finest table birds found in the United States. It is small, about fifteen inches long and two feet in alar extent,

graceful in its movements, beautifully variegated in its colors, and so timid and rapid of flight that it is quite difficult to bag. A general description will enable any one to recognize this bird. His head and neck are grayish lead-color above, with the extreme top of the head black, and a white crescent-shaped spot between the eye and the base of the bill on either side. His wing-coverts

THE WHISTLER DUCK.

are blue, and glisten like metal. His back is brownish toward the neck, with two narrow bands of purplish-gray. His tail

is somewhat wedge-shaped, and his feet fully webbed. I have found the nest of this bird often, and it is almost invariably in the midst of a great heap of weeds, leaves of aquatic plants, and other vegetable *débris*.

The green-winged teal (*Nithon carolinensis*) is a rather smaller bird than the blue-winged fellow, but is of much the same habit and appearance, excepting that its prevailing color is green instead of blue, and its head and neck a chestnut-color. It eats while swimming, and is a remarkably fine diver. Its flesh is a delicacy. Its wing feathers are excellent for arrow vanes. I saw Will shoot a shaft tipped with these feathers two hundred and sixty-eight yards against the wind.

The most beautiful as well as the most palatable of our river ducks is known by the two names summer-duck and wood-duck all over the eastern part of the United States, and perhaps as far west as the Rocky Mountains. I have killed it in Florida, Georgia, and Indiana, hunting it most successfully along the smaller mill-streams and shallow ponds of the interior. The wood-duck (*Aix sponsa*) is to me indescribably

SHOOTING THE WOOD-DUCK.

beautiful, and has always been my favorite game. It is easily recognized by its heavy purplish-green crest, the white crescent in front of each wing, and the bars over its eyes meeting under the chin. Its lower neck, sides, and tail are purple; its back uniform with delicate pencilings of green and bronze, primaries silver white, top of head black. It builds in hollow trees, or in the cavities made by the flicker and great black woodpecker, generally choosing the depths of a wooded swamp. Its young, as soon as hatched, clamber out of the nest and tumble to the earth unharmed. Water is generally not far away, and thither they follow their parents, darting about in a lively way, seeking and finding their own food from the first.

Large numbers of the young of this bird are destroyed by water-snakes, snapping-turtles, minks, musk-rats, and raccoons. I once found a fine drake struggling to keep above water with a snapping-turtle a pound in weight hanging to his foot. An arrow secured the bird, and a stone served to smash the turtle. So thick are these pests of turtles in some of the Southern streams that you have to hurry to your game on knocking it over, or the chances are that it is dragged under the water.

From the first of September till the middle of November the wood-ducks in considerable flocks may be found on most of the brooks of the Middle and Western States, and when not more than a year old, they are fine eating. I know of no sport that can compare with that of shooting these birds with the long-bow and arrows. They seem to have been made for the special game of the toxophilite. They sit steadily on the water, are less shy and frisky than the teals, and though rapid fliers, they do not take to wing as readily as most river ducks. But their short flights especially recommend them to the archer. You may get half a dozen shots at a wood-duck while you are getting one at a whistler or a teal.

The most exciting time we ever had with these favorite birds was in a small inclosure where there stood ten or fifteen large stacks of wheat. The ducks had lit on these stacks, and were busily at work eating the grain and wrangling over the best spots. Will and I slipped up, under cover of a worm-fence, whose corners were grown full of tall elder bushes, and let drive, pinning a couple to the straw. The flock was startled, and instantly took to wing, but so completely were we hidden by the bushes that they soon settled again and fell to work on the wheat. We let fly again and again, till we had killed seven ducks, and the flock was frightened away by Will in his eagerness discovering himself in trying to shoot two arrows before the birds took to wing.

VI.—A FELLOW-SPORTSMAN.

A true sportsman will admire a hawk as an adroit and indefatigable member of the hunting profession. Somewhat of a pot-hunter, and not very particular about the Sunday and game laws, the hawk may be, but nevertheless he is to be admired for his skill and bravery, his persistent energy, and his muscular force. He is an excellent shot, too, rarely missing his game if he has a fair chance. It is a beautiful thing to see a goshawk or a blue-tailed darter change himself into a missile, and descend like a bolt upon his prey.

Watchfulness, cautiousness, and exceeding shyness are marked characteristics of the hawks, and it may seem paradoxical to add that they are bold, brave, audacious, daring, almost reckless. While it is only by the sharpest strategy that the sportsman or hunter may ever approach nearer than a hundred and fifty or two hundred paces of a hawk, it is nevertheless true that I have seen a goshawk pick up a chicken within a cane's reach of me, and escape with the prize.

The natural home of most of the hawks is in the deepest, darkest

parts of our heaviest forests, where their nests, built in the tops of high trees, are not likely to be disturbed by man or vermin. The shell-bark hickory seems to be a favorite tree with the red-tail, while the goshawk and blue-tailed darter prefer the matted tops of tall pine-trees for their building places. These trees seem to be selected on account of their altitude giving a wide scope of vision, as they overtop the surrounding forests, and also on account of their not being favorite trees with the opossums, raccoons, and other small predatory animals.

Cooper's hawk (*Accipiter cooperi*) is one of the finest birds of Eastern North America. It may easily be distinguished by its long slender body, twenty inches from tip to tip, and by its long wings, tail, and tarsi. Its color above is a rather light ashy brown, growing a shade or two darker on the head. Light transverse bands of rufous and white

CONFLICT BETWEEN A HAWK AND A SNAKE.

are traced on its under plumage. Its flight is rapid and graceful, skimming along near the ground, wheeling about in every direction. The watchfulness of the bird is only equaled by its courage. It often attacks, kills, and partially devours birds and other animals larger than itself. I once found one eating an opossum which would have weighed twelve or fifteen pounds, and from the marks on the dead animal's body, and traces of a hard death-struggle on the ground, I am sure the hawk had attacked and killed this victim. I killed the hawk, and found that it barely measured twenty-nine inches across from tip to tip of its wings. This hawk's tenacity of life is almost equal to that of a cat. I was once hunting meadow-larks and killdeers in a large sedge field, when one of Cooper's hawks sailed past me so near and so leisurely that I succeeded in driving an ounce arrow through his head just below the eyes, and instead of dropping dead, as one would expect, it flew in a winding, irregular way for several hundred yards, and lit in the top of a persimmon-tree, and refused to come down till I had pierced its body with two more shafts.

The sharp-shinned hawk (*A. fuscus*) is considerably smaller than Cooper's bird, or rather it is shorter of body, being only about one foot long, while in alar extent it is nearly two feet. Its upper parts are brownish-black tinged with a sort of ash-color, while its under plumage is light rufous lined with transverse bands of white, and its throat is streaked with black. Its under tail-coverts are white. Its flight is slow and often circular, just above the ground, though sometimes it darts about in a zigzag way, changing its course so frequently and suddenly that it is almost impossible to follow it with the eye. As it thus drifts about in the air, its eyes are scrutinizing every thing, and ever and anon it falls, like a vertical downward shot, upon a quail, a frog, a sparrow, or a snake. A friend of mine once saw a hawk of this species seize a large moccasin or adder, and soar to a considerable height with the serpent writhing in its claws. Suddenly the bird closed its wings and fell heavily to the ground. My friend hurried to the spot, and found the hawk quite dead, the snake having bitten it in the neck. But the unrelaxing claws of the brave bird were buried in the vitals of its venomous victim, so that it also died. I saw one once trying in vain to kill a terrapin.

VIII.—THE YELLOW-BILLED CUCKOO AND TWO FOREST BOHEMIANS.

Whoever has spent a few summer days in our forests, especially those lying in the hill country south of the Cumberland range of mountains, has been startled into attentiveness by a strangely hollow, vibrating voice that, breaking over the ripple of finch songs,

went beating about the woods in half-mournful, half-defiant echoes. A Western ornithologist describes this sound as "a strange hammering or pounding note frequently heard in the woods both day and night." I have never heard it after sundown. It is the voice of the American or yellow-billed cuckoo (*Cuculus americanus*)—a bird whose habits are as remarkable as its music is mournful and unique. Restless, lonely, spirit-like, it haunts the greenest and pleasantest places of the woods, often invading our orchards, but not to depredate. It has no taste for the racy fruits so dearly loved by the wood-pecker. It feeds on the most loathsome caterpillars and disgusting larvæ, seemingly without relish, mechanically. But, after all, it is a handsome bird, sleek and bright, delicately modeled in every respect, and its plumage, though plain, is beautiful. The bird has long wing feathers, a long tail, and an exceedingly slender body, the latter thickly covered with a close-fitting dress of peculiarly downy feathers.

When Will and I get into the summer woods with our long-bows, the cuckoo is a favorite object of chase. We like him because he is easy to get near and very difficult to hit—two qualities giving to the archer the maximum of fun. Carrying the bow and quiver is not in the least like carrying the gun. An archer in the woods is for the time an ancient, or at least a mediæval, huntsman. He enters into the spirit of his sport, wrapping himself in a cocoon of Arcadian fancies. He thrids the cool green ways of the wood, forgetful of steam-engine, printing-press, the electric current, and dynamite. Great cities and splendid homes mingle not in his visions. He is a simple, innocent heathen. His life for the time is full of music. It is said that the clear, sweet note of Diana's bow-string gave birth to the idea of stringed musical instruments, and that all the melody of guitar, violin, and piano, which now overlaps and entrances the world, comes down from that one spring of music far back in the dim region of eld. The sound of the bow-string, the key-note of all music, is the archer's delight, and this is why I have said that the maximum of sport to him is to get as many shots as possible, and at a difficult mark. Not so with the gunner. He is modern and realistic; he wants meat; he thinks of his tooth; he counts how much his ammunition has cost him, and glances at the newspaper market reports to see what his birds are worth.

For singular habits I place the blue jay (*Cyanurus cristatus*) beside the cuckoo, howbeit the two birds are as different in every respect as day from night. The blue jay is the prettiest of the American cone-bills (conirostres). But his beauty is his only attraction. His ways are not the ways of righteousness, and none of his paths are peace.

He seems to have no conscience, and therefore he is very happy all the time. The colored gentry of the South have it that the blue jay owes to the devil one day's work in each week, and that at precisely one minute past one o'clock Friday morning the birds start for the infernal regions to render the service due. Of course this is only an idle fancy, sprung from the brain of the dreamy negro, but blue jays are rather scarce on Fridays.

The blue jay is a dandy, a smart, disagree-

large, fierce, and radiant; his bill is short and strong. The common cry of the blue jay, not unlike "de-jay, de-jay," is rather harsh and disagreeable, but his wheedling love-notes, "too-loo-loo, too-loo-loo," are tender and sweet. The building-place of this bird is on the low strong branches of trees. He can not be domesticated, and is not like himself in a cage.

Will and I once visited the paradise of birds—at least we think so. It was a small delta lying between two little brooks that

BLUE JAY AND YELLOW-BILLED CUCKOO.

able babbler, an overbearing bully, a murderer, a robber, and a petty sneak thief all in one. He is as audacious as a book peddler, and as cunning as a jealous woman. He is somewhat larger than the black-faced red-bird of the South, which he resembles very much in shape and in his manner of flight. As indicated by his name, blue is the prevailing color of his plumage, a color that runs through all its most beautiful shades along his back and tail, melting into silver white on his breast. He has a heavy, pointed crest, dark, brilliant, erectile; his eyes are

run together in one of the wildest and sweetest places in the Southern hill country. A natural orchard, consisting of clumps of wild plum-trees, with here and there a haw bush, overtopped by scrubby oaks, formed the wood growth, while under foot short thick green grass, flecked with a great variety of wild flowers, carpeted the ground. This delta or gore between the streams was thus wooded and decorated as far back as the foot of a ledge of high scarpd rocks, so that we had about forty or fifty acres of wild orchard, grass, and flowers. Small birds of many

kinds had come here to nest and spend the summer, and among them were the flaunting jay and the mysterious cuckoo. For three days we drew the bow in this wild garden of fruit and song, having great sport, and adding much to our knowledge of the ways of the birds. About noon of the last day of our stay I was sitting under a plum-tree enjoying a pipe, and Will was taking his siesta beside me. Just before me stood a small broken-topped red oak, in which I chanced to discover a cuckoo's nest (for you must know that our American bird builds its own nest and hatches its own young). A very interesting scene followed this discovery. Pretty soon a blue jay came fluttering along, and lit on a bough near the nest. Immediately he turned his head to one side, and uttered what Will calls his Eureka note—"Jee-jee-jee." I saw business on hand; so I gently shook Will to wake him, and pointed to the jay.

"There's a cuckoo's nest up there, with young ones in it," I whispered.

"All right," said Will, clutching at his bow; "I'll tap the jay."

But I held his arm.

"Let's see what he'll do," I added. So we sat still, and saw a battle. The jay waltzed up the limb to where the nest lay, in among the fresh sprays that had sprung out around the place where a part of the tree's top had been broken off. At the brink of the nest he paused, and squealed again. The young birds stretched their necks and opened their mouths. The jay snapped one of them half in two and flung it to the ground. At this moment there came a ghost-like cry from some high tufts of leaves above the nest, and a cuckoo fell bodily upon the jay.

"Give it to him!" hissed Will, excitedly.

Down came the two birds to the ground,

fighting one of those silent fights which mean death or victory. But the blue jay was the master, and would have soon made short work of the poor cuckoo. Will saw this, and before I could interfere, let drive an arrow which stretched both birds dead on the spot. This was the last shot in the paradise of birds. We folded our oil-cloths, caught and saddled our ponies, cast one look behind us at the orchard, and then, as the flood of summer wind rolled over us, we set our faces northward, and rode up among the green foot-hills of John's Mountain.

Meantime, side by side at Will's belt dangled the two feathered Bohemians.

VIII.—IN THE WOODS WITH THE TURKEY.

That family of birds called by the naturalists *meleagrina* has a representative here in the United States of which the true sportsman never tires speaking, and I am sure no epicure ever refuses to eat its delicious meat as long as he has room for another morsel. Taking its size and its rare flavor into consideration, the wild turkey (*M. gallopavo*) is, perhaps, the king of American game birds. Three and a half feet

long and five feet in alar extent, it often weighs over twenty pounds avoirdupois; wherefore it will not be wondered at that a sportsman considers the bagging of a turkey something to boast of.

The general appearance of the wild turkey is almost identical with that of the domestic bird of the same name, excepting its color. The game bird is invariably of a dingy black. The male, however, at certain seasons is glossy and almost beautiful.

The wild turkey is fast becoming extinct, and the time is not far distant when we will look in vain for these delicious birds in our markets. Comparatively few sportsmen, even now, can boast of many turkeys bagged in a season.

After the young turkeys are hatched, the mother bird makes them the objects of her most constant solicitude and care. She creeps stealthily about leading them into the densest thickets of the woods, piping to them in a low, tender way, always alert, and at the least sign of danger gives them a signal which sends them into concealment until by a soft cluck she calls them forth.

WILD TURKEYS.

When the young turkeys are from one-third to half grown, they are delicious for the table, and nothing is finer sport than shooting them. You can very rarely get sight of them on the ground, but when startled by a small dog, the flock will generally rise and light among the lower branches of the nearest trees, when, if you are careful, you may get some nice shots.

IX.—THE GRAY RABBIT.

The hare has always been considered the most timid of animals, as well as the most tender. "My hare," was the very softest and sweetest phrase in the Roman language. In the days of the empire, *Milepus* were the words of endearment breathed into the damsel's ear by the loving youth just ready to don the toga. The reason of this will be well understood by whomsoever has had the exquisite pleasure of devouring a broiled rabbit saddle, served with gravy, for breakfast.

The rabbit, or, if we follow the naturalist, the hare, is found everywhere in the eastern part of the United States, from Florida to the great lakes of the North. With us as a people the name is rabbit, no matter what the zoologists may say, and no matter how many varieties may be found; but the hunter knows the gray rabbit from the brown hare as well as he knows a woodcock from a partridge; and the epicure is disgusted at once when he finds that his servant has purchased a long-legged wood rabbit (*Lepus americanus*) instead of the delicately penciled gray rabbit (*L. sylvaticus*), the difference in their flavor and the consistency of their flesh being quite marked.

In the Southern States, where the forests are thickly grown with pine underbrush, rabbits are exceedingly numerous, and you may every where see their paths crossing and recrossing each other. Taking advantage of this habit of following certain well-defined trails, the negroes of the South snare and trap large numbers of them.

Rabbits have, especially when wounded, an inexplicable habit of running in a circuit of only a few hundred feet in diameter. I once followed one seventeen times round the periphery of two acres of brushy land before

I finally secured him, and often in hunting with the long-bow and arrows I have found it a good plan, when a rabbit has been wounded and has made one turn, to stand and await his re-appearance at any point of the circle, while another follows on his track. I recollect a singular incident connected with this peculiar habit, so characteristic of the rabbit that I will relate it as illustrative of its foolish simplicity as well as of the untiring energy of a weasel. I was standing near a worm-fence that inclosed a small patch of wheat just beginning to head,

RABBIT AND WEASEL.

watching for a quail which I was decoying, when a rabbit ran past me, keeping between the fence and the dense wall of green wheat. It was too late in the season for rabbit-shooting, so I allowed it to go unharmed. To my surprise, in a second or two, a small brown weasel rushed by, following madly on the track of the flying game. I sent an arrow at the earnest little thing, but missed it. A few moments elapsed, and the rabbit, having made the circuit of the wheat, again ran by me. I looked out sharply for the weasel, and got another shot at him, planting the arrow in the ground just in front of him. He did not even halt, but running right over the shaft, kept on in full chase of his intended victim. Round and round that little field went pursuer and pursued, till the circuit had been made no less than a dozen times. Finally, despairing of being able to hit the weasel with an arrow while

it was running, I seized a club, and, watching for it again, rushed after it as it passed, intending to overtake and kill it. My movement, while it did not in the least startle or discomfit the weasel, caused the rabbit to break into the wheat, and start diagonally across the field, and the weasel following, both were at once out of my sight. In less than ten seconds I heard the rabbit squeal, and knew the race was over. Hurrying, club in hand, to the spot, I found the game's throat cut and the weasel very complacently sucking its blood. My cudgel soon made an end of the little vampire.

XL.—AMONG THE SQUIRRELS.

About the time when the moist places of the hollows and flats of our woods begin to force the buds of the red elms and swamp-maples to expand into tufts of exquisitely soft and tender leaves; when the crow-foot and the turkey-pea are in full bloom; when the days are languid and warm, and the nights have a lingering touch of chilliness in them; when the sun comes up clear and yellow, and starts the fog upward from the dewy meadows and fallow lands—at such time, and fully alive to the joyful influence of the season, the young squirrels come forth, about half grown, to frisk and frolic, to nibble fresh buds and young leaves, to quack and squeal, and chase each other up and down the trees, and—to be shot by the wary sportsman. Broiled squirrel, if the game is not over six months old, is deliciously toothsome, but when under three months of age, every mouthful is to the epicure what opium is to the dreamer of the Orient, something to make him forget care and love-life—for the sake of eating.

The largest of our squirrels, here in the United States, is the fox-squirrel (*Sciurus vulpinus*), found in the Southern States from North Carolina to Western Texas. It seems to me a distinct species. Its habits are peculiarly its own in many respects, and the shape of its head, its heavy dog-like limbs and body, its habitat (the high dry pine and black-jack hills), all considered together, with its black ears and nose tipped with white, have clearly settled its claim for separate individuality of species.

When quite young the fox-squirrel is tolerable for the table, but the lobster-like redness of his bones is disgusting to many. His food is principally acorns, chestnuts, and hickory-nuts. These he hunts in winter as well as summer, seeming to have no inclination to store away any food for bad weather. He has his den usually in the hollow of a low scrubby black-jack or post-oak tree, near or on the very crown of a high windy hill or ridge.

This squirrel is as tenacious of life as a cat. I pinned one through the ribs once with a two-ounce steel-pointed arrow with-

out so much as knocking him off the bough on which he sat. It took two heavy thwacks from two-ounce pewter-headed shafts to bring him down. I am sure the fox-squirrel lives to a great age. An old negro informed me that he knew of one that for eighteen years had lived all alone in a certain old tree on a hill back of his cabin, and I have no reason to doubt the truth of the story.

The cat-squirrel (*S. cinereus*), erroneously called fox-squirrel by some, is rather smaller than the species above described, and has a broader, more cat-like head. Its color is ashy gray mixed with yellow on the back, tawny or yellowish-brown on the sides and under parts. This species haunts thinly wooded districts, preferring a flat country and large trees. It eats nuts, acorns, larvæ, and often makes great havoc in fields of Indian corn. It is not so wild as the fox-squirrel, and may frequently be seen very near the houses and grain-cribs of farmers in the Middle and Western States. When young it is good for the table, but not so tender, juicy, and sweet as some of the smaller squirrels. Rapid of foot, nimble and strong, the cat-squirrel skims along the ground or darts from root to top of a tree like a yellow flash of light. Nevertheless, I have seen it called clumsy and slow of motion. It is a wary, watchful little animal, fully versed in the craft of all wild things. You rarely see one unless it is when he is on the ground, and then he quickly scampers to a tree, and from that moment keeps the trunk betwixt you and him. Of course he is difficult to shoot, and for this reason it is great fun to hunt him. In the beech and white-oak flats of Indiana, Will and I have lost more arrows after cat-squirrels, and strained our bows to less profit financially, than it would be prudent for me to carefully estimate.

The gray squirrel (*S. migratorius*) gives us fine sport, and sweet, delicious broils. Approach one of these little fellows carefully, and he rarely climbs higher than the first strong limb of the tree he takes. In fact, I have often knocked them from logs, and bowled them over while on the ground. I saw Will shoot from behind the corner of a worm-fence and kill one on a stake not more than sixteen feet distant.

The gray squirrel is very quick in his movements, sometimes dodging an arrow sent with all the force of a ninety-pound bow. But he is as curious to know all that is going on as an antelope or a woman. I killed one at the tenth shot once, he poking his head from behind a tree to gaze at me after each shot, the last one excepted, it knocking his head entirely off.

The ground-squirrel—*Tamias (S.) striatus*—is the little brown and dark striped fellow, the chipmunk of our fences, wood-piles,

fields, and deadenings. His cluck is the most familiar sound heard in our rural districts, the note of the red-headed woodpecker excepted. He is a size smaller than the chickaree, or mountain squirrel, feeds on nuts, acorns, and grain, and is by most farmers considered an irrepressible pest.

The flying-squirrel (*Pteromys volucella*) is little larger than a large mouse, light gray on the back and silver white below. It has rat-like eyes, and a singular membrane or flap at each side running from the fore to the hind legs. It seems to me of little kin to the squirrels proper—scarcely as much as the owl is to the eagle. It is strictly nocturnal in its habits, and, like the bat, spends the day-time sleeping in dark places—holes in trees, and behind loose bark in deadenings. I have seen them from the Gulf States to the Northern lake regions. In the hill country of the South, where most people live in open log-houses, the flying-squirrels are sometimes more troublesome to housewives than rats. While Will and I were sojourning in Cherokee, Georgia, the family with whom we were living became greatly annoyed by the nightly visits of a swarm of these winged rodents. They came into the house, squeaked and chattered, used their teeth on every thing they found, cut clothing and table linen to pieces, and, despite a cat or two, ran about the floors and up and down the walls all night long. Finally, thoroughly bent on putting a stop to their orgies, Will and I one bright moon-lit night watched for them, and found that most of them came from an old dead pine stump, some fifty feet high and two feet in diameter, which stood fifty yards from the house. Early the next morning our bows were strung and business commenced. We found the old stump literally honey-combed with holes made by woodpeckers. In these the flying-squirrels had taken up their abode. A heavy blow on the stump with the back of an axe brought half a dozen of the frightened little pests, each one running to the top and sailing off, falling at an angle of about fifteen or twenty

degrees, floating down gently like a dry leaf. Most of them lit on neighboring trees, from which Will and I took great delight in knocking them. We kill-

ed that morning a great number of flying-squirrels, and after that our sleep was peaceful, and our dreams uninterrupted by their clatter. Besides, we received a vote of thanks from the family we had thus relieved.

The cool green ways of our woods have no livelier or more interesting inhabitants than the squirrels, and, if we except a few game birds, the sportsman finds no animal that offers finer sport or sweeter meat. Of all the merry days spent by Will and me in our woods and fields with bow and quiver, those are about the merriest which inclose our life among the squirrels. This is, perhaps, much owing to the fact that the seasons for hunting these active little fellows fall in the two finest stretches of weather seen in our climate—the last days of spring, and the early ripening time of autumn.

BIRDS' NESTS.

II.

CLIFF SWALLOW'S NEST.

IN my first article on birds' nests, in the June number, I divided them into four classes--those supported from beneath, those supported from above (or pensive), those supported on one side, and those which are excavations in earth or wood. The first two classes I treated in that article; the last two are the subjects of this paper.

SECTION OF GOLDEN-WINGED WOODPECKER'S NEST.

established. The observant Wilson, who ransacked Pennsylvania from 1790 to 1810, never saw them, and his successor, Bonaparte, speaks of the cliff swallow as "annually invading a new territory farther to the eastward," and says, "This induces us to conclude that a few more summers will find it sporting in this immediate vicinity, and familiarly

DOUBLE NEST.

The nests of certain swallows are among those supported on one side; and to the cliff or eaves swallows I shall first direct the attention of my readers. These birds have caused much interesting speculation; their past history is but little known. The question is, Have they actually migrated eastward from the Mississippi to the Atlantic since the settlement of the United States by Europeans, or have they apparently done so by gradually leaving their natural haunts for those of man? It would be improper to introduce here such evidence and scanty records as we have of their early history; but at least one fact is known--that they formerly built their nests altogether on cliffs or steep banks (still doing so in some wild parts of the country), and now build them under the eaves of barns, etc. Had they been in New England when it was first settled, and if they began to use barns sixty years ago, as they are known to have done, their change of habit would have followed civilization westward; but their appearance about man's buildings was remarked in the West first, and the recorded dates become generally later the further to the eastward that they have been

WOODPECKERS' NESTS.

established along the Atlantic shores" (this being written in 1825). I believe, therefore, that these birds originally lived among the bluffs and cliffs of the West, were reached by the tide of advancing civilization, were attracted by the facilities which man's belongings offered to them, and, as their numbers increased, travelled toward the Atlantic, seeking and finding further accommodations. On the other hand, even in the last century the white-breasted swallows, purple martins, and chimney swifts had deserted in a great measure their nesting-places in hollow trees and stumps to occupy bird-boxes and chimneys, while the barn swallows, which were probably indigenous to the Eastern United States, were established in barns, in which, as now, they built their nests on the inside beams and rafters.

The cliff swallows show wonderfully the influence of man's progress, having not only extended their range (as I am led to believe) many hundred miles, but having modified very materially their architecture. Their nests are built chiefly of mortar or plaster, of which mud or clay is the basis, and which becomes hard, though rather brittle, when dried by the atmosphere or baked by the sun. Their strength is due to the adhesive and cohesive force of this material. When built on cliffs, as shown in the accompanying picture, they are shaped like a round flask, often with a neck, through which is the entrance. As built in New England and other parts of the Atlantic States, they are more open, and have no neck, being protected above by the projecting roof of the building, under the eaves of which they are placed. The eggs are white, with brown and lilac spots and speckles, but are not ordinarily distinguishable from those of the barn swallows, whose nests are always inside of buildings (as those of the eaves swallows seldom are).

Even more interesting are the nests of the chimney swifts, popularly known as swallows, though not such from a scientific point of view. At a distance they may easily be recognized by their nervous flight, long wings, and apparent want of tail. If examined closely, they are seen to be of a very dull brown, and to have the shafts of their tail feathers projecting beyond the web, so that they can more easily support themselves when clinging to an upright surface. They have made the bold experiment of using chimneys instead of hollow trees for nesting-places, and have succeeded admirably, having begun so early that, so far as I know, they have never been known to naturalists under any other popular name than that of chimney-swallow. Their nests are made of small sticks, which the birds break off from tree-tops while flying, and these are held together and to the wall by a sticky saliva (of which the "edible birds'

nests" of the East are altogether made). Their eggs are white, and long in proportion to their breadth.

Though several swallows retain their primitive habits of nesting to a limited extent, and in limited tracts of country, the common grayish and white bank swallows are the only ones which have retained them altogether. They continue, in settlements of various sizes, to make their burrows in banks of sand or gravel, choosing most often those near water, less often those on road-sides. The study of their excavations is quite endless, owing to the variety of circumstances which must be taken into consideration, and I shall not try here to enter into its details. The care of the birds in building is to reach a stratum of firm earth, from which pebbles can not drop upon their eggs. For this purpose they sometimes dig inward three feet. At the end of the burrow are placed a few materials, upon which the delicate white eggs are laid. The entrances are from two to three inches wide, often circular, and sometimes within a foot or two of one another. The burrows vary in construction and depth, but are usually from fifteen to twenty-four inches long.

On the shores of some lake or mill-pond a solitary burrow, much larger and deeper than those just described, may often be found—that of the kingfisher. This bird was formerly supposed to lead a most eccentric life, having power to calm the waves when he wanted to fish, and intrusting to them his nest, which was said to float about with the eggs and young. As the kingfishers can swim but very little, the young, according to the fable, must have led a very precarious life; but nowadays, since romance has given way to practical comforts, the kingfishers lay their eggs and bring up their children in dry and roomy nurseries, with water no nearer than the necessity of food requires. They feed on small fish, and capture them by plunging into water, their plumage being so oily that they have no difficulty in getting out. They may be recognized by their very short legs, their large head, with its rough crest of loose feathers, and by their peculiar cry, like a watchman's rattle. Though their feet are weak, their bill is large, sharp, and strong, and they use both in making their excavations. Any other person than an enthusiastic naturalist will do better to accept another's account of these burrows than to try to find out all about them himself, unless he prefers digging four or five feet into a sand bank. The kingfisher's eggs are white, like those of the bank swallows, but are about twice as long, and have four times as much bulk.

There are only two birds in New England which make burrows, and I therefore pass on to the woodpeckers, who are carpenters and clever architects. They gain a living for the

most part by hopping about trunks and limbs, supporting themselves with their stiff tail feathers, and picking small insects from the bark, or extracting grubs from beneath it by boring, or rather chiseling, small holes, which are not, I believe, injurious to orchard trees or others.

The golden-winged woodpeckers have a pointed and rather long bill, partly adapted to their habit of feeding on ants from the ground, but yet a very strong one. In spring they generally choose a sound, hard-wood tree in which to make their nest, and go to work on the trunk at some height from the ground. They dig inward a few inches, and then downward, sometimes more than two feet, but commonly much less than that. The passage made varies considerably in shape, but is always enlarged toward the end, as seen in one of our illustrations, drawn from the longitudinal section of a woodpecker's nest. So hard is the work that the birds can finish it only by persevering for two or three weeks; and yet very often, alarmed by being watched or found out, or dissatisfied with their first choice of a position, they abandon a begun or half-finished excavation to make another, sometimes in a different part of the same tree. They never advance, so far as I have observed, more than two inches in one day, and they rarely accomplish so much as that. They work chiefly in the morning, especially in the earlier part, and do not work at all steadily throughout the day. While making the entrance they cling to the trunk, and deliver sharp blows after drawing back the head; a chip is then broken off and dropped to the ground, where, together with its fellows, it betrays to the observant passer-by the nest above. As the hole is deepened, the birds can not be seen at work, but now and then they come out to drop the chips. It is astonishing how quickly they hear one's approach, and the ease with which they turn round to fly out or to show their heads at the entrance. Watch a woodpecker go in; throw a stone against the tree, and instantly the bird is out again. When the excavation is finished, the eggs are laid on the chips at the bottom, no lining ever being used. These eggs, like those of all woodpeckers, are smooth-shelled and pure white. On examining the nest, one is struck with its symmetry and finish. The entrance, about three inches wide, is sometimes circular, but often is an arch, as represented in the engraving.

The nest of the downy woodpecker (which has a bill blunted at the end, or "truncated") is similar, but much smaller. The entrance, which is circular, as shown in the engraving, is about two inches in diameter, sometimes so narrow as to make one doubtful as to the possibility of its owner passing through. The nest is usually made in

a partially decayed tree, and sometimes in an old post. It may most often be found in a birch, poplar, or button-wood tree, and not unfrequently in a branch instead of in the trunk. The architects choose their building site with care and instinctive skill. It is not to be supposed, however, that their loud rapping in early spring is made for the sake of testing the soundness of any wood: it is made by the male and female when calling to one another.

As the woodpeckers sometimes content themselves with a natural cavity, so the little chickadees (with black crown and throat), which almost always do so, or which are glad to find a commodious but deserted woodpecker's home, sometimes spend much time and labor in making an excavation for themselves, with a neat entrance about an inch and a half in diameter, and itself rarely more than six inches deep. At the bottom of this they make an inner nest of any warm materials which they can find—moss, wool, feathers, hairs, etc.—and lay six or more small white eggs with brown speckles. The shell is so thin that the yolk shines through, giving to the eggs before blowing a delicate blush. The same is observable in the woodpeckers' and many other eggs, which often lose much of their natural beauty when prepared for the cabinet. No birds are more tender-hearted parents than the chickadees. If you break up their nest or take their eggs, they follow you along the wood path, now silent, and now uttering such a sweet, plaintive whistle that you repent of the mischief done, and regret that it is too late to repair it.

Many birds make use of natural cavities* for nurseries, but the smaller kinds always line them at the bottom, or, in other words, build their nests in the hollows. The bluebirds are among these latter, and among the very first birds to begin housekeeping in spring. Sometimes they use a bird-box, but more often an old apple-tree or fence post. They are careful in their choice, and may be seen in March or April wandering in pairs through orchards and along fences hunting for a home. On finding one, they spend a few days in making it warm and dry; the female then lays four or five light blue eggs. In the same class are the great crested fly-catchers, which are not very common, but are well known on account of their peculiar nest. Their eggs are very handsome, being buff or creamy, streaked and "scratched" with purplish and a winy brown. The nests are nearly always composed partly of a cast-off snake-skin.

Some of our wrens also build in holes, such as the great Carolina wrens (common to the southward of New England, but extremely

* Such nests should be ranked as a fifth class. See the beginning of this article.

rare in it), the winter wrens, and the common house wrens. A nest of the winter wren which I found in the White Mountains of New Hampshire is extremely interesting from the care with which it was concealed. It was in a retired part of a swampy tract of woodland, in a spot with a confusion of fallen trunks and branches, and in a low, moss-covered stump. The stump I have still; but, without pulling it to pieces, few persons would find readily the home within, for the entrance is only an inch wide, and is covered by a piece of hanging moss. The cavity inside is thickly lined with feathers, as one finds on inserting a finger. I should not have found the nest, after being attracted to its neighborhood by the singing male, had I not seen the female at work and going in and out.

The common house wrens (small and brown, with dark transverse waves) are characterized more than any other of my feathered friends by pertinacity. Their conduct at the time of nest-building is often extraordinary. Almost as often as not they begin by a quarrel, in which they are generally to blame, but are also successful. Sometimes they wish to obtain a ready furnished house, and, finding none unoccupied, take possession of the most attractive which they can find in the absence of its owners, and on the return of the proprietors are so persistently rude as generally to drive them away. Sometimes they merely take a fancy to the situation of a neighbor's home, and, having seized upon the latter, pull it to pieces to make room for a new structure, or fill it up with rubbish of their own collecting that it may be small enough for them, for they quarrel with much larger birds than themselves. When they build their nest peaceably, though they sometimes choose a simple cavity in wood, they are addicted to choosing extraordinary situations, and, having once carried in their materials (sticks and twigs, afterward to be lined warmly), they are not disconcerted by having them removed, but persist many times in replacing them. I give below a partial list of the interesting situations in which the house wren's nest has been found, and I do not doubt that it might be extended over a page: an old hat, the sleeve of a coat, a tin spout, a broken jar, the space between two cogs of a disused mill-wheel, the "box" of a carriage, a stove, a ventilator, a wooden pump, a basket, a milk can, etc.

I shall close this article by a conundrum and its answer. What birds lay their eggs in a nest, yet build no nest nor use an old one, do not sit upon their eggs, though these are not hatched by the sun, and never feed their young? Secondly, how is all this brought about? The answer to the first question is—the cow-birds. The answer to

the second is longer. It may not seem appropriate to speak at length, in an article on bird architecture, of birds who build nothing; but closely connected with them is the subject of *two-story* birds' nests. The cow-buntings do not mate as most other wild birds do, but in spring and summer commonly form small flocks. Neither male nor female show any affection toward one another, nor toward their young. The female, when ready to lay, becomes very nervous, as is natural to a mother who has no home prepared for her offspring, and she therefore looks about anxiously for a nursery and a nurse. Finally, she sees a bird building, or finds a nest just completed, perhaps with fresh eggs in it. She waits until the poor warbler, vireo, or sparrow is gone, then steals up and lays her egg, sometimes returning soon afterward to lay another. The mother thus imposed upon soon comes back, and in consternation calls her mate. Strange to say, they very often accept the strange egg, hatch it, and care for the chick until he can care for himself. Were it not so, the race of cow-birds would no longer exist, unless those birds altered their habits very materially. Sometimes, however, they abandon their nests; less often they destroy or remove the foundling; very rarely they add a story to their nursery, leaving the strange egg on the lower floor, where it comes to nothing, and laying their own eggs in the upper chamber. Among our illustrations on page 256 is a representation of one of these double nests. When a small bird, such as the cow-bunting usually selects for the purpose, consents to become the foster-mother of the stranger deposited with her, her history for the rest of the season is a sad one. The parasite's egg is larger than her own, and consequently receives so great a share of warmth from her body that hers usually become stale, or at least it is hatched first. In the latter case the young cow-bird soon clears the nest for himself and fills it up. His foster-parents are now devoted in providing him with food. He is greedy and lazy, and seems to stay in the nest much longer than is necessary. When at last he makes up his mind to take care of himself, and shows that he is not utterly helpless, he leaves the friends to whom he owes his life without thanking them, and, joining his comrades, becomes a member of the cow-bird community. The facts just related present many interesting questions for discussion. Upon these I can not enter here, but let me say to my readers that in the study of birds they will not only find many subjects for philosophical speculation, but many sources of pure pleasure, combining healthful exercise and the study of Nature, which, if thoroughly appreciated, can not but inspire us with good sentiments and good taste.

STRONGER THAN DEATH.

Who shall tell the story
As it was?
Write it with the heart's blood?
(Pale ink, alas!)
Speak it with the soul's lips,
Or be dumb?
Tell me, singers fled and
Song to come!

No answer: like a shell the silence curls,
And far within it leans a whisper out,
Breathless and inarticulate, and whirls
And dies as dies an ailing dread or doubt.

And I—since there is found none else than I,
No stronger, sweeter voice than mine, to tell
This tale of love that can not stoop to die—
Were fain to be the whisper in the shell:

Were fain to lose and spend myself within
The sacred silence of one mighty heart,
And leaning from it, hidden there, to win
Some finer ear that, listening, bends apart:

An ear that hears the sunlight woo the snow,
Detects the fire in a lily's kiss,
And hearkens, like an untaught child, to know
How holy is the place in which love is.

"Fly for your lives!" The entrails of the earth
Trembled, resounding to the cry
That, like a chasing ghost, around the mine
Crept ghastly. "The pit's on fire! Fly!"

The shaft, a poisoned throat whose breath was death,
Like hell itself grown sick of sin,
Hurled up the men; haggard and terrible;
Leaping upon us through the din

That all our voices made; and back we shrank
From them as from the starting dead,
Recoiling, shrieked, but knew not why we shrieked,
And cried, but knew not what we said.

And still that awful mouth did toss them up.
"The last is safe! the last is sound!"
We sobbed to see them where they sunk and crawled,
Like beaten hounds, upon the ground.

Some sat with lolling idiot head and laughed;
One reached to clutch the air away
His shrunken lips refused; some cursed; and one
Knelt down—but he was old—to pray.

We huddled there together all that night,
Women and men from the wild Town;
I heard a shrill voice cry, "We all are up.
But some—ye have forgot—are down!"

"Who is forgot?" We stared from face to face,
But, answering through the dark, she said
(It was a woman): "Eh, ye need not fret;
None is forgot except the dead.

"The buried dead asleep there in the works—
Eh, Lord! it must be hot below!
Ye'll keep 'em waking all the livelong night,
To set the mine a-burning so!"

And all the night the mine did burn and burst,
As if the earth were but a shell
Through which a child had thrust a finger touch;
And, peal on dreadful peal, the bell,

The miner's 'larum, wedged and wrenched the air;
And through the flaring light we saw
The solid forehead of the eternal hill
Take on a human look of awe,

As if it were a living thing that spoke
And flung some protest to the sky,
As if it were a dying thing that saw,
But could not tell, a mystery.

The bells ran ringing by us all that night;
The bells ceased jangling with the morn.
About the blackened works, sunk, tossed, and rent,
We gathered in the foreign dawn.

Women and men, with eyes askance and strange,
Fearing, we knew not what, to see.
Against the hollowed jaws of the torn hill
Why creep the miners silently?

From man to man a whisper chills: "See, see!
The sunken shaft of Thirty-one!
The earth, a traitor to her trust, has fled,
And turned the dead unto the sun.

"And here—O God of life and death! Thy work,
Thine only, this!" With foreheads bare,
We knelt, and drew him, young and beautiful,
Thirty years dead, into the air.

Thirty years dead and buried from the day;
By the swift poison caught and slain;
By the kind poison unmarred, rendered fair
Back to the upper earth again—

Back to the breathing earth that knew him not;
And men and women wept to see—
For kindred had he none among us all—
How lonely even the dead may be.

We wept, I say, we wept who knew him not;
But sharp a tearless woman sprang
From out the crowd (that quavering voice I knew),
And terrible her cry outrang:

"I pass, I pass ye all! Make way! Stand back!
Mine is the place ye yield," she said.
"He was my lover once—my own, my own;
Oh, he was mine, and he is dead!"

Women and men, we gave her royal way;
Proud as young joy the smile she had:
We knew her for a neighbor in the town,
Unmated, solitary, sad.

Women and men, we gave her silent way.
Calm as a sigh she swept us all;
Then swiftly, as a word leans to a thought,
We saw her lean to him, and fall

Upon the happy body of the dead—
An aged woman, poor and gray.
Bright as the day, immortal as young Love,
And beautiful as life he lay.

Her shrunken hands caressed his rounded cheeks;
Her white locks on his golden hair
Fell wanly. "O love," she cried, with shriveled lips,
"O love, my love, my own, my fair!"

"See, I am old, and all my heart is gray—
They say the dead are aye forgot—
There, there, my sweet! I whisper, leaning low,
That all these women hear it not.

"Deep in the darkness there, didst think on me?
High in the heavens, have ye been true?
Since I was young, and since you called me fair,
I never loved a man but you.

"And here, my boy, you lie, so safe, so still—"
But there she hushed; and in the dim
Cool morning, timid as a bride, but calm
As a glad mother, gathered him

Unto her heart. And all the people then,
Women and men and children too,
Crept back and back, and back and on,
Still as the morning shadows do,

And left them in the lifting dawn, they two.
On her sad breast his shining head
Stirred softly, as were he the living one,
And she had been the moveless dead.

And yet we crept on, back and back and on:
The distance widened like the sky
Between our little restlessness and love
So Godlike that it can not die.

BARNABY PASS.

ITS name was originally a good Scripture Barnabas, but had degenerated into Barnaby; its location was among the high mountains of one of the Southern States; its characteristics were darkness and wildness. It had a brook flowing along its narrow length, and the cliffs on each side were high and straight; you could ascend them by searching for foot-holds and drawing yourself up by the trees, but you could not run up, or indeed climb up, with the least grace, for it was a matter of time, and you must go, as it were, although erect, on all fours, using both hands and feet. Below, there was just room enough for the brook and the roadway, with hardly a yard to spare; the cliffs rose like walls, shadowed with leaning trees, and made the day dark even at noontide. How the brook ever caught any sunshine down there in that deep green trench was a mystery; but it did. Josepha had seen it catching and reflecting beams much more gayly than the river that ran through the broad open meadow outside. Once she said to her mother that she thought it was like a woman who could love but once, whereas the river in the meadow was like a fair, lovely heart that is sweet to every body, the sunshine, the winds, the bees, and the clover scents, and to all alike.

"Nobody loves any body, of course, but their husbands," replied Mrs. Kay. "I can not imagine where you get your fancies."

"Nor I, mother," said Josepha.

But Mrs. Kay was not Josepha's mother, only her step-mother; a fair-haired little woman whom Joseph Kay had married, with that sort of unconscious fatuity which comes, as a kind of equalization perhaps, after middle life to almost all much-admired men; believing that all women are pining for them, they fall an easy prey to the first infantile-faced person who has an object in securing them. Josepha's own mother had died when her little daughter was but two months old, and the girl had spent her life with an aunt, and at boarding-schools of an austere kind, until, at her father's sudden death, she was called home to Hope Cottage to take care of the still fair-haired but faded little step-mother. It had been no home to her; but it was a pretty place, and she looked around the luxurious rooms and the rose garden with slow surprise. She had not realized that life could be made so pleasant, for her aunt was an iron-nerved woman, and in her house lamps were not shaded for the eyes, nor chairs fitted to the back, nor rooms made beautiful for mere beauty's sake. But for the mind there had always been every aliment. Thus Josepha had become what she was—a quiet girl with a large store of book-knowledge, and a large ignorance of all that constituted her step-moth-

er's ideas of living and of life. "It is not that she is disagreeable at all," said Mrs. Kay, sitting up in her heavy crape to receive a visit from Mrs. Verdyne, her rich neighbor, "but so different, so unsympathetic; and I, as you know, with my extreme sensitiveness! It is very hard."

Mrs. Verdyne thought it was, and made one or two beautiful remarks. She then took her departure, having fulfilled all the duties of the occasion: let it be understood that Mrs. Verdyne always fulfilled all her duties to a T. The whole of the widow's visiting list, very well-bred people all of them, fulfilled their duties likewise; they wrote notes of condolence, to which Josepha was obliged to reply, copying from her step-mother's dictation.

"I do not see the necessity for this," she said one day, suddenly pausing over the fortieth sheet.

"Ah! life is not all necessity, child," sighed the widow from her sofa.

But it turned out that there was a good deal of necessity in it, after all, for Joseph Kay's affairs were found to be involved, and his widow was left with less than nothing. This last phrase was repeated more than once by the lawyers engaged, and by those lookers-on who always gather unctuously around a broken fortune, like birds around a wreck.

"I do not know what you mean by less than nothing," said Josepha at last. "She has me, and I am something, I hope."

"We hope so too," said the lawyers. "But young ladies nowadays—"

"I have found out since I have been here," said the girl, bluntly, "that I do not belong to 'nowadays' at all. Mother herself has told me so. It is just as well, as things have happened. Pay the debts, and give us what you can, Mr. Brown. I shall take mother away."

"What are you going to do, Miss Kay?"

"Teach, of course. That is the only thing I can do."

And so it happened that as friends fell away from the wreck, as they always do, Josepha set out alone in her little row-boat, with her step-mother in the stern, on the long voyage of life. The austere aunt gave them a little, but she herself was not rich, and so fixed in her ways, besides, that it would have cost her great pain to diminish her various contributions to the missionary societies and educational institutions in which she had long been interested. Josepha and her mother drifted from one place to another, poor and poorer as time wore on, until at last the girl was glad to obtain this position of mistress in a school among the Southern mountains, in one of those settled regions in the midst of wildness which the traveller comes upon with surprise. These little neighborhoods are fringes around

springs whose waters have attracted visitors for generations. Two years had passed since her father's death, and Josepha had seen something of the dark side of life; but she had a calm, prosaic courage and a thorough way of working hard which did not leave much time for borrowing trouble—an amusement belonging generally to doleful idleness. They started on their journey, and in due time arrived at a small village, a half-way station between the Springs and the railroad, where the stage stopped, and where there was a mountain inn. Here Mrs. Kay, grown resigned to her fate, but quick as a cat to take advantage of whatever of pleasure appeared, wished to remain. "We could see the stage go by every day, and perhaps sometimes the passengers would take tea here," she said, hopefully.

"I am sorry, mother, but we can not do that; it is too far from the school. I must try to find a little home for us that will be nearer."

"Of course, since *I* wish it, we can not do it; it is always so," said Mrs. Kay, dissolving not into tears exactly, but into a certain dampness of tone and visage. "And I think I could stand it better, Josepha, if you would not persist in calling me 'mother' in that business-like way. If I had had a daughter of my own, I am sure she would have called me 'mamma.'"

"I think it very probable; but as I have been brought up differently, won't you try to overlook my deficiencies, mother? I know they are many."

"I know they are also. Why conceal it?" said Mrs. Kay. "But I do my best with you, and the spirit of my sainted Joseph can view us with satisfaction, I am sure, in every respect save our worldly surroundings, which, however, are trash to the spirits, I suppose," she added, with a sigh.

"I hope father's spirit has something better to do," said the girl.

"You cold-hearted creature, talking on such a subject in that unmoved way! What would you have your father engaged in up there, I should like to know? But I positively believe you would like to have him saw wood, provided there was any, and a necessity for fuel; and he as delicate a handed man as ever lived! I must say I can not understand you, Josepha."

"Oh, well, there is not much to understand!" answered the girl, with a weary little laugh. She was very contemptuous toward herself at times, for she thought she ought long before this to have accomplished something in the world, whereas all she had done so far amounted merely to keeping the wolf a few steps from the door.

Mrs. Kay's crape was all worn out now; her weeds were made of *barége*. She never failed to be distressed about this every time she left the house, lest she should meet some

of her old visiting list, who must have been endowed with extraordinary powers of moving about to have been in all the places where she looked for them. Josepha had begun by explaining that they could not possibly be here nor there; but, after a while, she had perceived that even the distress was pleasant to her step-mother, as a relief from the monotony of the life she led, an exciting possibility lurking around every corner and coming out of every house door. Every carriage might contain, every person approaching might be—who knows?—somebody she had known. A thousand times had she rehearsed in her mind her opening sentences, with the sighs all ready at the proper places, and she took great comfort in this exercise, and was affected even to tears by the little scenes she conjured up, apropos of a back like somebody's, or a Roman nose that had associations.

They found a little brown house, and settled themselves in it with their few belongings; it stood at the edge of Barnaby Pass. The school was on the opposite side of the small valley, half a mile away; and four times a day the young mistress took the straight walk between the corn fields and over the bridge, following a little path bordered with Michaelmas daisies that ran alongside of the dusty road. But nothing passed save the winds and the bees, and, at night, the cows, walking solemnly and far apart, each in her own golden cloud, and thinking, no doubt, that all the world was dust.

Mrs. Kay arranged the house; then she re-arranged it. Then she began anew, and arranged it all over again. It grew to be quite a common thing for the daughter, coming home, to see all the chairs and tables out on the piazza.

"I am glad you are interested," she said.

"Interested!" said Mrs. Kay, throwing up her hands—"interested! But that only shows how little you know me. I try, in my poor way, to have the house in some kind of order, so as to be ready in case any one should come, and you talk about interested! But I know my duty. I have very little to work with, it is true; yet I flatter myself that my *taste* at least is unimpeachable."

Josepha went on eating her bread in silence. She had not the tact or thoughtfulness to say pleasant things, and, not thinking that calico ruffles improved the wash-stand, or that the veiled barrels were successful toilet-tables, she would not say so. Her step-mother, however, set this down to ignorance, and went on with a certain kind of happiness in her preparations for wildly impossible contingencies, as she had done steadily, with whatever materials she had at hand, ever since they left Hope Cottage.

They had come in the late winter; it was

now spring. Josepha taught almost continuously, not only in school hours, but out; for she had evening scholars at home, and on Saturdays a dozen lessons. The only time she kept for herself was from five in the afternoon until dark, and Sundays, when she had all the day. In the afternoon she walked. After a time, tired of the meadow, she wandered into the Pass. It was in April; she never forgot the day. Not that any thing happened; at least only so small a matter as an awakening on her part to what had been in the world always from the beginning, although *she* had not had eyes to see it. As some day, after months spent over grammars and dictionaries with apparently little progress, a language will all at once burst upon the student, and suddenly he knows it all, so now, as suddenly, this girl was taken all at once into the order of Nature-lovers, leaving forever the great majority who have eyes and see not, ears and hear not, and hearts into which it has never entered even to conceive the beauty of God's earth. There had been a shower the night before, and the cool Pass had kept the moisture; the earth of the roadway was elastic and dark, and exhaled a peculiar freshness, the aroma of the contented soil. The low bushes along the brook were covered with a light green lace-work of small buds, some opening into little leaves, others curled, others still but fuzzy down; on the cliff-side were clustered the ferns in troops, in regiments, all kinds, from the delicate Venus-hair to the bold evergreen with spear-pointed tips, which took care of her. Then began the trees, growing in ranks one above the other, and Josepha, walking along and looking up, saw their green tops swelling out, row after row, until the last brushed the sky. The strip of blue at the top was narrow. The girl could see it for some distance, as the Pass was almost straight for nearly a mile. Indeed, with all its length and windings, one came out of it at last almost directly opposite this entrance, eight miles back as the bird flies. The brook flowed along with the rushing sound one hears in dreams when bound by fever in a hot city. It seemed to laugh, and the sunset light came down to it as magically as Sindbad flew down into the valley of diamonds. Birds were singing their spring songs here and there, each, no doubt, with a demure little auditor near, and unmindful of the rest of the Pass, which, nevertheless, listened. It was a wonderful bird auditorium, for there was no hum, no whirl and shrill insect chanting, as in the meadow outside, the little loud-voiced, sun-loving creatures rarely venturing into the shadows of the Pass. There was no jar of passing wheels, no lowing of cows, only the low rush of the brook, like an organ accompaniment. One bird on a near bough trilled forth such a rapturous shower of notes that Josepha, listening, said

to herself, "I have never heard a bird sing before." With her senses filled with new delights, the leaf-bud tracery before her eyes, the touch of the woolly fern crosiers on her hands, the fresh odors of the brown ground inhaled with her breath, and the bird songs and rush of the brook in her ears, at last she turned homeward.

"To-day is an era in our life here, mother," she said, as she took her seat at the tea table.

"The stage has then begun to come this way?" said Mrs. Kay, putting down her cup excitedly.

"No; I believe not."

"What then, you disappointing girl?"

"I have made the acquaintance of—"

"Some one staying at the Springs?"

"No, mother: of Nature."

Mrs. Kay threw herself back in her chair and tapped her foot on the floor impatiently. "I shall never become used to your ways, Josepha," she said. "You do try me dreadfully sometimes. Talking of Nature, as though you had really met some one of importance! Have the goodness to explain what you mean by 'an era in our life.'"

"I mean that the acquaintance is to be for both of us, mother. If I can not persuade you to go with me into the Pass, then I shall bring its influence out for you."

"And what may this influence be?" asked Mrs. Kay, resignedly.

"A kinder spirit, mother, and more efforts to make you happy."

"I do not see what the Pass has to do with that, Josepha; and as to efforts, they are not in your line at all. You can go steadily on in your monotonous way, doing the same thing day after day; but as to efforts, real true efforts, *I* am the person who makes them in this family. Efforts require verve, inspiration. Look at that divan!"

The divan was a dry-goods box covered with chintz. In spite of hay, it had a most un-Orientally hard appearance, and being without back, engendered discomfort and whitewash for the unwary occupant. Josepha looked at it, and decided that she could never be a Turk; but the new influence of the Pass made her say, after a moment, that the chintz was pretty, whereat the person of efforts condescended to be pleased. The chintz *was* pretty: Mrs. Kay had understood colors in her day. It was this singular mixture of things which she did and did not understand that made her mind like an old curiosity shop, where, amid much rubbish, occasionally something of value is found.

After that day Josepha went into the Pass every afternoon. She learned to feel that delicate yet deep enjoyment which Nature gives to those who love her, something which can hardly be described or expressed, but whose intensity is nearer the soul than

the influence of any poem or philosophy ever written on a book's page. It is true that there are many persons, otherwise exquisitely endowed, who can not appreciate this enjoyment, as there are persons also who can not appreciate music. But this taciturn girl was of a different nature, and she had at last come to her own. Her favorite seat was on a high crag where the sunset light fell on her head; there she sat and took in all the perfume and uncurling of the spring, and listened to the growing.

One day in July the stage did come through the Pass; Josepha, on her crag, heard it rattling by below, and was angered. She did not want the world there. However, the world did not come. Day after day Mrs. Kay, who had watched carefully from her little piazza, reported "not a passenger;" day after day her small tableau of herself, her work-basket, and her white cat remained unnoticed save by a small driver in a large flapping hat, who did not seem at all impressed by it.

"I can not understand it," she said. "I thought a great many persons visited these springs; I am sure I have heard of them all my life. Not as one hears of Saratoga, of course, but still as something quite fashionable in its way, like camping out in the Adirondacks, or going to those queer little places at the mouth of the St. Lawrence."

After a while Josepha herself met the stage, and, in spite of her jealousy, could not bear anger long against the intruder, it was such a forlorn old vehicle. It had no curtains over its windows, no shining gorgeous paint; its wheels were dingy, its springs incrustated with ancient mud; the rack behind looked as though it had never held a trunk, so shriveled and lean were its ancient leather coverings. Four thin horses drew this old ghost, and their countenances showed that although, according to law, they were having an easy time of it, they knew better; the merry voices of nine inside and six on top would have cheered them, and they were ashamed, in a horsely way, of the dingy vehicle behind them, and the fact that there were never any passengers save mail-bags. They had known better days. The driver had stopped to water his team. Josepha, coming down from her crag, paused on a ledge above him, and bowed slightly, according to the custom of the country, where all passers-by salute each other. He nodded in return, and climbed down on to the wheel; under his flapping hat she saw his small brown face and lantern jaws.

"What stage is this?" she asked.

"The Greenoway express, mum."

"But it does not go as far as Greenoway, does it?"

"No, mum—it don't."

"You have not many passengers," she ob-

served, when the little man had refilled his pail and the second horse was drinking.

"No, mum—we haven't."

"Why do you run, then?"

"To carry the mails and please old Scrannel Swan."

"Who is old Scrannel Swan?"

"A skinflint, I reckon."

"Do skinflints run stages here for pleasure?"

"No, mum; but they do for spite when they've got the contract and make money out of it," said the driver, going off for another pailful.

"Why have you taken lately to coming through the Pass?" continued Josepha, watching the third horse take his turn and drink a little with dejection.

"Bridge down the other way."

"When it is repaired, I suppose you will go that way again?"

"No; reckon not. The Tunkers' meeting begins before long, you see."

"Where?"

"In the Pass here."

"Here?"

"No; three miles up."

"Who comes to this meeting?"

"Tunkers."

"What are Tunkers?"

"Sorter Dutch Shakers."

"What do they do?"

"Well, they pray some; and they eat."

"Oh, a camp-meeting."

"No, mum, begging your pardon," said the driver, emphatically, standing on tiptoe to check up his horses' heads, which seemed, however, no higher after the operation than before. "Camp-meetings belong to my own Church, if you please, which is the Methodist, and hez nothing in common with Tunkers." He then climbed up to his seat and untwisted the reins. "I bid you good-day, mum," he said; and the old stage started off with a groaning and rattling of every joint.

That evening, when Christian Converse came for his lesson, Mrs. Kay asked if the stage that passed every afternoon was the stage to the Springs.

"You did not think that old trap was the Crystal stage, did you, ma'am?" said Christian, who, with red hair, bare feet, and a spelling-book, was yet desperately in love, in a bashful, awkward way, with the school-mistress. "That air's the old express that carries the mail through the mountains west of here. The Crystal coach goes the other way to the Springs, and a stunner she is, too."

"Then it never comes by here?"

"No, ma'am; all the Springs coaches go by on the other side of the river."

"Now, Converse, begin your lesson," said Josepha. She called the large boys by their last names, and had thereby won, though all unconsciously, their deepest affections.

"We must certainly move over across the river, Josepha," said Mrs. Kay.

Every afternoon now in the Pass the school-mistress saw the old stage, or heard it rattling by below over the rocky road, while she sat on her high crag. She did not come down again to talk to the driver, but she fell into the habit of waiting for it to go by before she started homeward, using it as a forest clock. After a week or so the camping people began to appear, coming over the bridge and up the road between the corn fields toward the Pass in wagons, in old gigs, and on horseback—plain sober folk, upon whose faces reigned a subdued excitement; for this assembling of themselves together in the greenwood to hold converse and to rouse religious fervor was the one festival of their lives. They were not "Tunkers," as the driver had called them, but a kindred sect of German origin, Separatists from the Lutheran creed. All the year round they toiled on their small farms, men, women, and children, like patient beasts of burden, with hardly a thought above the ground they tilled, and the principles of their faith might have been summed up in the words industry and economy. Their religion was sober enough during eleven months of toil; but in the midsummer came their time for rejoicing, and this year the Pass had been selected as their gathering-place.

"They are the most outlandish-looking people I ever saw," announced Mrs. Kay, every time Josepha came home from school. "The women have their funny yellow hair braided in tight but most elaborate little braids at the backs of their heads, and they carry their sun-bonnets on their arms. They have narrow-skirted blue gowns, hanging straight down, and such figures!"

"As Nature made them, I suppose, mother."

"No, she did not; but long generations of wooden ancestors did, perhaps. They are just like the wives of Shem, Ham, and Japheth in the toy arks."

"I should like to see them and their camp," said the girl, after a moment. Then she laughed, and added, "I might go in the old stage, and be a solitary passenger arriving at last from somewhere, like a novel."

"Do not dream of any thing of the kind," said Mrs. Kay. "Although there is no church here, we still remain good church people, I hope, and have nothing to do with strange religions."

"I was only joking, mother."

"I did not know you ever joked."

"I do not—often; but when nothing else happens—"

"Happens!" said Mrs. Kay, impatiently—"happens! Nothing ever happens here, or ever will."

But something did happen.

In spite of the camping people, numbering

now some hundreds at the gathering-place, the old stage went by every day empty; the little driver, however, wore an expectant air, and he had fastened two blue rosettes on the leaders' heads, which ornaments, nevertheless, had no effect upon the settled dejection of their long horse-countenances. One afternoon the stage was late. As its rattling wheels had not disturbed her, Josepha, forgetting the flight of time, had sat on her crag in a reverie until after sunset; she now hurried down into the road. It was more than twilight down there, almost darkness; a thousand glow-worms were out in the dusky air. She walked rapidly; she was not afraid; but she knew her step-mother would be full of alarm. Presently she heard a rattling sound. The stage was behind her; it drew nearer. She stepped aside quietly, and it passed. Then, in a moment or two, there was a crash, and a sudden "whoa!" It had broken down. She came up and spoke; she was obliged to make her presence known, so that in the darkness and on the narrow road they might not drive over her.

"No danger," said the driver. "She's broken clean down. You hain't got a match, have you?"

Josepha had not. "You can come as far as our house and get a lantern," she suggested.

"I can't leave my passengers," replied the little man, importantly. "I'm responsible for 'em and their luggage to the company."

"To Scrannel Swan, you mean," said Josepha, laughing, entirely incredulous as to the passengers. But a new voice spoke at this moment, and startled her into silence.

"Driver," it said, "can the stage go on or not?"

"Mebbe not this one; but another will go, of course, in its place," replied the driver, in a finely assumed tone of careless certainty. "I shall have to go back, though."

"Where to?"

The driver was vague in his answer. The stables of Scrannel Swan were not prolific of coaches. Still, he thought he remembered an old red wagon standing there, and his plan was to walk back with the horses, six miles, and get it. "In the mean time you will have to wait until I come along," he said, "and this lady's house is the nearest."

"I could not think of intruding," answered the voice. But it was climbing out of the wrecked coach all the same, was on the ground, was looking around, was making out the figure at the side of the road, was approaching it, was taking off its hat, was speaking one or two polite generalities, and waiting to hear the accents in reply.

"You can wait at our house, if you like," said Josepha, answering. "As the driver says, it is the nearest. We will all walk there together."

So, after a few moments, they started, Josepha, the stranger, and the driver on a line, the latter leading one of his horses, with the other three following in the darkness, and clattering over the rocky road in a way that would have frightened a nervous woman. The stranger said as much. "But I am not nervous," replied Miss Kay.

They were about a mile from the entrance of the Pass, and it was a queer walk. Conversation was kept up by the stranger, but Josepha did not say much; she listened, however. And she mixed his words strangely with the subtle influence of the darkness and the looming cliffs. She was too unconventional to care what he would think of her being so far from home at that hour. It was an accident: it had never occurred before, and would never occur again. Of what consequence was it?

But if she did not consider, her step-mother considered for her. Alarmed at her absence, Mrs. Kay was on the point of venturing into the Pass herself, preceded by old Judy, who acted as maid-of-all-work, carrying a coal-oil lamp, and by Judy's grandson, "Beverley," a scampish little black of ten years, who carried a lantern. Mrs. Kay herself had a candle, and, holding up her skirts with the other hand, she was coming out of the gate with gingerly steps. Judy was already in the road, the lamp's light flaring on her white turban, and Beverley was turning a few somersaults in advance, the lantern on his toes, when the clatter of horses' hoofs was heard, and in another moment the driver's flapping hat, the head of one horse, Josepha's face, and the stranger's, came into the circle of radiance. The stranger bowed; he was well dressed; he had the air of a gentleman. These three facts Mrs. Kay took in at a glance. A slight flush rose in her thin cheeks, her lifted skirts were smoothly falling in an instant; she heard the explanations graciously, and led the way to the house. The driver was gone with his horses, Judy had retired, a meaning glance from her mistress fixed in her quick intelligence, the stranger was seated, and Mrs. Kay was entertaining him, all in another five minutes. Josepha was seated too. Her dress was damp with the dews of the Pass, her heavy hair somewhat disordered; she was tired, and did not concern herself at all about her attitudes. Her step-mother knew this without looking, and sat with double grace to make up for it. After a while old Judy served a delicious Southern supper in the little dining-room, at a wild expense of the whole week's stores: but never mind. She had understood her mistress's eye. The stranger noticed every thing without apparent observation. Mrs. Kay was too well bred to allude to former prosperity, but its ghost lurked in every intonation of

her voice, in every motion of her delicate withered hands. It was all a plain story—the cottage, the parlor, and herself. But this tall, unlike daughter? She understood the incongruity, and took occasion to say, with a little sigh, when the girl was not in the room.

"Josepha is only my step-daughter."

"Ah, when you called her daughter, I thought that it was impossible *you* could have a child of that age," replied the stranger. He had told his name immediately, Martin Gage, and his residence, New York. But he said nothing further.

About ten o'clock, when the brightening influence of the coffee had faded away, and old Judy had gone to bed, and Mrs. Kay herself was sleepy, as old blondes always are at an early hour, the conversation fell more into Josepha's hands. She was not sleepy at all. Things had been said that aroused her attention; she was slowly waking up. Many a time she had told herself that she must be dull-witted, because nobody ever cared to talk about what she liked to talk about, so she had taken refuge in taciturnity. But now already at least three subjects had been broached which had interested her for years. Her eyes brightened, she began to fuse a little; generally she was hard metal, that would not melt. Mrs. Kay leaned back on her sofa, and let them talk. "Perhaps he is a literary man," she thought. Then, after a moment, she added to herself, "But no; he dresses too well for that."

After a while it came out that the stranger was going to the camp-meeting. The listener was aroused at once. "What in the world is he going there for?" she asked, inwardly. "But perhaps he owns the ground. After the war a great deal of this Southern land fell into the hands of Northerners." She listened again, but caught nothing. They were talking of phrenology.

"I fear I am keeping you up very late," said the stranger, as Judy's sharp-voiced little clock struck eleven in the near kitchen.

"Yes; we are generally asleep by half past nine," said Josepha.

"Here in this mountain wilderness," hurriedly interposed Mrs. Kay, "there is so little to engross one—no society or any thing of that kind, you know."

"I can not imagine what has become of my driver and his coach," continued the visitor. "Perhaps it would be as well for me to walk down the road to meet him. Indeed, I think I should enjoy the walk; it is a fine night."

"But it is not a fine night; it is very dark," said Josepha. "You only say that because you think we are tired. The house seems chilly, but I will soon remedy that. I am not at all sleepy myself, and if mother is, she can go to bed."

Mrs. Kay came to life with vigor. "You funny child!" she said, tapping Josepha's arm playfully. "What will you say next? And—where *are* you going now?"

"To get some wood," replied the girl; and before her mother could interfere, she had brought in an armful and laid it down upon the hearth.

"Allow me," said the stranger, springing forward.

"Very well, if you like. Only, as I particularly enjoy making fires, I consider it a favor."

"So do I," said Gage.

He lighted a match, looked around, then took a newspaper from his pocket.

"You need no paper," said Josepha. "That shows how little you understand light-wood." She knelt down, set up three little splinters together like the poles of a miniature tent, applied the match, and in a second the whole pile was gloriously blazing, and the room full of light.

"The pitch-pine of the South," explained Mrs. Kay. "It really becomes an æsthetic pleasure to light fires under such circumstances, Mr. Gage."

"I quite agree with you," replied the young man, looking at Josepha, who had risen, and was standing on the opposite side of the hearth absently warming her hands and watching the blaze.

"He certainly knows what to say," thought the elder lady. Then she too looked at Josepha. The girl looked well, almost handsome, but the small step-mother could never have appreciated that. I suppose the canaries have but one opinion as to the clumsiness of the slow white swan down in the pond.

Another long hour spun itself out over the bright blaze, Mrs. Kay keeping her eyes open, but yawning desperately behind her fan. She had ceased to follow the course of conversation, but maintained a watch for stray sentences, like a man fishing on the bank. She caught little of importance—only allusions to a home and a father somewhere, and once something about "our guild." "He can not be a missionary," she thought; "only High-Churchmen use that term." She scrutinized him carefully. "No, he is not a High-Churchman," she said to herself—"at least not an extreme case. He has not that serene, sweetly humble, yet proudly superior air which they all have; and, besides, he is too broad-shouldered. A home and a father—that is something. For young men nowadays do not talk about their fathers unless they are very decidedly proud of them for some reason or other. On the whole, it looks well."

At midnight a rumbling sound was heard outside; the old red wagon had arrived. Martin Gage took leave, asking permission to call on his way back. "I shall only stay at the camp a day or two," he said.

"It will be very interesting there, no doubt," said Mrs. Kay.

"Well, I don't know about that; I go on business," replied the stranger.

"Decidedly he owns the ground," thought the widow, cheerfully.

The next afternoon Josepha started for the Pass as usual.

"You never go as far as the camp, I suppose?" said Mrs. Kay, in a suggestive tone.

"No," replied the girl.

She went no farther than her usual crag; but on coming down, this time before sunset, there was the stranger gathering ferns along the road below.

"Ah, you have ferns too," he said. "I will walk to the mouth of the Pass, and carry them for you."

"You need not," said Josepha.

"But I should like to."

"Oh, very well."

"You are so strong, Miss Kay, that you do not like to be assisted, I suppose. Still, you must not forget that other persons are stronger."

"They are occasionally; but generally I *am* the strongest person present," said the girl.

"Do you see that stage lifted up on the side of the cliff?"

"Yes."

"Well, I did that."

"You must have been very cross, then."

"What do you mean?"

"Only that I have noticed that when a man makes any great effort of bodily strength, like lifting a heavy weight, he is always in an irritated condition—really a terrible temper."

"I *did* use some strong language, I believe," said Gage, laughing. "That short-bodied, big-hatted little driver had left his old coach right in the middle of the road, and, of course, we could not pass with our red wagon. The horses, not having wings, could neither climb up nor back up the cliff, and so there was nothing for it but a lift. I assure you that all the hard cider in the camp was hardly enough for me when I arrived."

"Do you like the camp?"

"It is picturesque."

"You do not seem to stay there."

Gage looked at her; but she had meant no epigram.

"Oh, I have finished my work for the day," he said, carelessly. "I came this way to meet you. I knew you were here every day, and, of course, you would make no change in your habits on my account."

Of course not," said Josepha. Still, she felt a little disturbed. The stranger, however, turned back to their conversation of the night before, and soon her mind was off, like a bird, over the fields of imagination and thought. It is astonishing how much

better two birds can fly together than one all alone.

At the mouth of the Pass he left her. "I have just time to hurry back before supper," he said.

"So they have supper?"

"Of course—with bright camp fires and gypsy kettles. Do you suppose, because they are religious, they are not hungry too?"

"The two things never seem quite to go together," said Josepha.

"Whether they seem or not, they *do*," said the stranger, laughing. "Look at the supper tables of donation parties and sewing societies." With that he raised his hat and went back into the dusky Pass, while Josepha, coming out into the still golden valley, went over the conversation thoughtfully.

She told her mother what had occurred, and Mrs. Kay thought a number of thoughts behind the tea-pot for several minutes. At last she decided not to interfere. "Josepha is not like other girls," she mused. The only remark she made was, "Promise me that you will always be home before dark, Josepha."

"Of course, mother; I always mean to be. That one night it was an accident."

The next afternoon Gage met her again. She had not expected to see him; but as her thoughts had been dwelling on some things said the day before, she willingly took up the conversation where they had left it, and they walked together to the mouth of the Pass again.

This was repeated for five days, and now she expected it; she likewise enjoyed it. Regularly on the way somewhere the old red wagon passed them, and the driver gave them friendly nods. He had still no passengers, but it was evident that he had an interest in Gage; he expected to take him back some time, and regarded him as he passed with a proprietary eye. The old coach remained where it was, tilted up against the cliff.

"He is staying much longer than he first intended," observed Mrs. Kay after a while.

"Is he?" said Josepha.

"He said only a few days. Have you any idea what he is doing there?"

"No, I have not; but he always speaks of being occupied in the mornings—business, he said."

"About the land, perhaps. Still, I do not see why it should take so long, unless he is laying it all out in lots," thought Mrs. Kay. "Has he said nothing about himself or his affairs all these days?" she asked, aloud. "Come, try to think."

"He spoke once of owning vast estates."

"Vast estates? Where?"

"Everywhere, he said. And he also spoke of a grand inheritance received from his father."

"But that is, I am afraid, a romance. It is too much to believe," said Mrs. Kay, slowly. "Only two or three families in the United States have any thing like that. I have been wrong, Josepha; I see it now. That man is trying to deceive us. You must not go into the Pass again."

"You are mistaken, mother. He is not *trying* to do any thing; he is perfectly at his ease."

"He is trying to interest *you*, child."

"Is he?" said Josepha. Then she blushed suddenly and deeply. "I never thought of it," she said.

"I know you did not; but he *is* trying. And I am afraid you are too much interested already."

"No, mother; it is only that I like to talk to him."

"And hear him talk."

Josepha colored again, this time slowly and almost painfully. The blood seemed to rise gradually in her face as she thought. "You are right," she said at last. "I shall not go into the Pass again."

The next afternoon she remained in the little shaded parlor with a book open before her, trying not to miss too much her crag and her fern-bordered road. The hours were long; through the window the Pass looked purple and cool; she felt herself longing for it. At dusk she threw aside her volume, glad that the day was done.

There came a sound of rattling wheels, and the old red wagon rumbled out of the Pass and stopped at the door. The little driver had brought a note. All it said was, "Why did you not come? I thought you were not going to change your habits on my account."

"Impertinent!" said Mrs. Kay. "No answer," she called out to the driver, who was waiting. Then a second thought seized her, and she went to the door. "Mr. Gage gave you this?"

"Yes, mum, he did. I'm 'bliging him by delivering it."

"I fancy he owns the camp-ground," said the widow, affably.

"Acts as though he did, mum; swells round considerable, and sends off passils and passils of big litters in my mail-bags," replied the driver.

"How do they treat him at the camp?"

"The Tunkers, you mean? They seem tickled 'most to death to have him there."

"But *he* is not a Dunkard?"

"Fur from it, mum. He isn't much on religion of any kind, I reckon," said the driver.

Mrs. Kay let him depart, and went back, lost in reflection. The next afternoon she herself suggested that her daughter should take a stroll.

"I shall not go, mother," replied the girl; and another sunset passed drearily. The

next day she was not tempted, for it had begun to rain.

It seldom rains in the Southern mountains during the summer, save an occasional short thunder-shower; but when it does rain, it is a torrent, and floods follow. The steep sides of the hills and cliffs gather and pour down the drops into the narrow deep ravines so suddenly that in an hour, sometimes, the brooks are out of their beds, swollen and roaring ten feet high over the roads. This happens only in the passes and defiles, of course, where there are no wide levels; the waters can not disperse themselves or sink through the hard rocky bottoms.

"The brook will be up before morning, sure as you live, and Barnaby 'll be all afloat," announced Christian Converse that evening, as he opened his spelling-book. "A man come through an hour ago, and he said at the other end er-ready the water was over the road, and old Squire Luken's milk pails was all washed away as had been left down by the fence while the boy went to supper."

"What will become of the camp, then?" asked Mrs. Kay.

"Well, reckon they've hed warning; and if not, they can take to the rocks; though they may hev some trouble with the horses. Me and Sam Brown's going in at daylight—along the cliffs—to see how they've stood it."

"Why not go now?" said Josepha.

"Well, you see, miss, it's powerful dark in Barnaby at night; and besides, they've got legs same as us if they want to come out," replied Converse. "They're nothing but Tunkers, anyway," he added, with that fine scorn for a foreign religion peculiar to native-American virtue.

After the boy had gone, Josepha went out on to the piazza, and down to the gate. She could distinctly hear the roar of the brook as it came out of the Pass, but she could see nothing, for the rain was still falling heavily. At ten o'clock she went to her room; at half past ten her light was out, but she was not asleep. She could hear the sound of the water now, even when her head was on her pillow. After a while she rose, dressed herself, and looked out. The rain had ceased; great broken clouds were lying across the sky, and between them the moon shone out. The brook had overflowed the corn fields; the stalks stood like reeds in a lake. The torrent coming out of the Pass was violent and loud as a water-fall.

"I really must see if I can do something," she said to herself. "There are women and children in there, and the cliffs are very steep. They do not know the way, but I do. I can help them now; at daylight other aid will come."

She put on a thick jacket and a small stout hat, unlocked the front-door softly, and stole out. No one heard her go. There

was moonlight enough to show the way. She went around to the side of the hill, and began to ascend by a path she knew. It took some time, for it was a roundabout course; but at last she was on top, overlooking the gorge. Holding on by a tree trunk, she peered down, but could see nothing through the thick branches; she heard, however, the swift rush of the water below. Taking a long breath, she began to descend, holding on tightly, and feeling her way step by step. Her eyes became gradually accustomed to the darkness; she could make out objects close to her; still, her progress was slow. Having reached the edge of the water, she made her way forward along its line, using the trees as supports and their roots as footholds. She worked on in this way for an hour. At last she thought she heard voices. She paused and called; a cry answered her. She hastened her climbing, and, after a moment, came upon a forlorn party, straggling apart from each other and lost in the darkness, but trying to move forward toward the mouth of the Pass in the same way that she was advancing in; but they were encumbered with children, and also with helpless aged persons, who had lost heart and courage, and were led and carried along. The working members of this party seemed to be all women; some of them were tired out, and sat like drift-wood caught on the tree trunks; you felt that if the water rose two inches they would be swept away. Others worked with zeal; but heavy babies, tied in their shawls, weighed them down, and impeded their progress. They panted, and struggled, and held on to the trees, these poor mothers, and dragged along the older children, who cried with fright. Josepha took a stout little boy from an exhausted young German woman, and soothed his weeping into quiet; then she proposed that they should all get themselves together and rest a few moments.

"We are not very far from the mouth of the Pass," she called out cheerfully and clearly. "But after you have rested a while, I think it will be better to climb straight up to the top. There there is a path down to the valley. I know the way."

"But *can* we, miss?" said the nearest woman.

"Yes; I came down from the top myself. But first, if you like, while you are resting here, I will go up and see exactly how steep the rocks are at this point."

This seemed to give confidence; the women drew together, the stragglers came up one by one. They all propped themselves behind trees, in the angles made by the roots and the cliff-side, not unlike sailors sitting in the rigging, and then it was that Josepha discovered that they were in reality marshaled by a man, who was, however, far behind, owing to his carrying children

on his back and in his arms, and helping several old women besides. The darkness and the noise of the water had prevented any explanation or comprehension of this. The man now disencumbered himself from his burdens, and placed them in safety; then he joined the new-comer. It was Martin Gage. Josepha was already climbing; he climbed by her side. There was not breath to spare for talking until they had reached the top, and it took them some time to reach it. Josepha sat down to rest for a moment, and said,

"No loss of life, I hope?"

"I think not," he answered.

"How shall we ever get them up?" she continued, turning to the subject in hand in her most business-like way.

"Oh, easily enough, by detachments. You shall stay here and receive them."

"I shall do nothing of the kind; I am going down to help."

"Of course I knew you would."

"Of course."

"But I had to suggest it, because it is what most women would prefer to do under the circumstances."

"You mean, let you do all the work?"

"Yes, since I *can* do it, and there is no vital necessity for you to help. I can bring them all up, one at a time."

"But I want to help."

"I know you do, you generous-hearted creature! Come down and help; and then, when it is all over, take *me*, and help me too."

He did not explain his meaning further; but, in some way, she knew. They were already climbing down the rocks again, and she had helped up four children, two at a time, and gone down again before she recovered her mental breath.

They had to work like Trojans (if any one knows what that means); they were two hours at it. The hardest labor was with the old people, who could not see, and whom they could not carry, but had to guide and encourage, step by step. At last it was over, and they were all assembled on top, where there was a comparatively level space. They could now begin to descend by the path, which could be discerned in the faint light of the coming dawn. Josepha, protecting herself by a bulwark of children from this intrusive suitor, walked first; then came the mothers and babies; Gage brought up the rear with the old women. Their march was necessarily slow. After a while they heard a cry; it came from down below, in the Pass.

"It is a child," said one of the women.

They all stopped to listen; then they heard another cry, and another. There seemed to be several children below. Some of the women shed tears; their own children were safe, but these must be children belonging to oth-

er members of their party who had not been so fortunate.

"I must go down," said Gage, "and one of you had better go with me. I may not be able to manage them all."

But no one stirred; mother-love is pitying, but selfish.

"One of you *must* come," said Gage, making strong use of the situation. "Do you want them to drown down there?"

At this Josepha stepped forth (as he knew she would). "I will go," she said. "All the rest of you sit down here, and wait for us."

They started. On the way Gage said something very lover-like. "Are you mad?" said the girl, angrily. This was not what she had intended to say at all; she had intended to be very proud and distant. But it is difficult to refuse an offer with dignity when climbing down rocks in the dark, and obliged to accept aid which the suitor, being of a bold temper and not afraid, takes care to make lover-like.

They had some trouble in finding and collecting the lost children. There were four of them, all boys, who had undertaken to get themselves out of the Pass without aid. They had started up the cliff with them, when a fainter cry came up from below.

"Another," said Gage.

"I will go down for that one, while you keep on up with the others," said Josepha.

"Very well," answered her companion, with lamb-like docility; and he disappeared up the rocks with his little troop, who, refreshed and cheered, climbed now like monkeys. Josepha went down toward the roaring water again. There, on its edge, she found a very little boy, crying, all by himself, behind a bush, the ends of whose bent branches were already swept by the torrent. She took him in her arms. His ankle was injured; he could not walk. She bound it with her handkerchief, soothed him, and considered what she should do. He was five years old, and heavy to carry. Suddenly she heard a new and louder roaring; new and deeper water was at her ankles—was at her knees. With the child on one arm, she climbed and sprang upward to a higher rock; but the current had almost swept her away. There had been a wash-out a mile up the Pass, and the temporary dam had made this new flood. The child was crying again loudly. A voice called her name, some one was at her side. "Give me the child," said this person; "of course you knew I would come back."

"I did *not*," said Josepha; but she obeyed. They climbed higher. But some of the trees had been uprooted, and were bending and falling; their position was full of danger. They were at a bend in the Pass, and the rising water climbed as fast as they did. They could have escaped that, perhaps, but not the swaying, crashing trees. Something

large and square floated by; it came near them. With an exclamation, Gage seized hold of it, climbed up with the child, and dragged up Josepha. It was the old stage. Its wheels were gone, and it floated. The man, excited and silent, steered with a broken branch, while Josepha held the child, clung to the old top-railing, and watched with dilated eyes the foaming water and the whirling, tossing roots and trees. There was a faint light now; they could see their danger. Again and again death came very near them, then swerved aside by a foot, by an inch, and spared their lives. Again and again the woman gave up hope, and said, "It is the last;" but only once did the man's quick hand fail, and then it was because no human power could save them. He leaned backward, threw his arm around Josepha, and pressed his lips to her cold white cheek; he said afterward that he did it as a last earthly farewell. But even as they sat thus, the great tree tossing close behind them, with all its branches outspread like impaling hooks, was held, was stopped by a rock, and the old coach was borne on. In real time all this was incredibly swift and short, as a canoe shoots the rapids of the Sault Sainte Marie. In apparent time it was long hours. When they were carried out into the valley, and stranded in the shallow water there, they were like persons who have seen a vision: every thing in actual life seemed vaguely unreal. The child, who had been so tightly held in Josepha's arms that he could see nothing, and who had actually fallen asleep, now woke, began to talk, and ask questions about the red bars across his face and hands, made by the woolen cloth of her jacket as she unconsciously pressed

him more closely to her breast. She tried to answer him, and the necessary words brought back things present. They climbed down from the stage, made their way through the wet fields, and at last reached home.

The brown cottage was busy giving breakfast to the camp people; old Judy did nothing but cook for hours. The house was full. Different parties of drenched Germans were constantly arriving, and the divan was covered with exhausted children, laid across it like bundles, while the mothers wrung out their dripping skirts. The procession on the hill had come down by themselves as soon as they could see the way. When Josepha appeared, her step-mother greeted her with outstretched arms and tears: "Oh, my beloved child, they say they left you in the Pass! How did—how *did* you get here?"

"Well, mother," said Josepha, slowly, "I came—by the stage."

At night the water was down again, only the mired corn fields and the stranded trees were left to tell of the flood. The neighborhood considered it rather a joke than otherwise that the Germans had been drowned out of Barnaby, and the camp people themselves had all departed, to continue their meeting on safer and better-known ground. One fact alone did not depart, but remained and faced Mrs. Kay.

Ah, well, there was no use in objecting, although he was only an artist, making sketches for an illustrated paper while waiting for higher work. His inheritance was a father's genius, and his estates those which an artist's eye owns every where; alas! alas! (Mrs. Kay added the sighs.) He is young, however, and has the greatest expectations. So have we.

EREMA; OR, MY FATHER'S SIN.

CHAPTER XXXIV.

SHOXFORD.

ARE there people who have never, in the course of anxious life, felt desire to be away, to fly away, from every thing, however good and dear to them, and rest a little, and think new thought, or let new thought flow into them, from the gentle air of some new place, where nobody has heard of them—a place whose cares, being felt by proxy, almost seem romantic, and where the eyes spare brain and heart with a critic's self-complacence? If any such place yet remains, the happy soul may seek it in an inland English village.

A village where no billows are to stun or to confound it, no crag or precipice to trouble it with giddiness, and where no hurry of restless tide makes time, its own father, uneasy. But in the quiet, at the bottom of

the valley, a beautiful rivulet, belonging to the place, hastens or lingers, according to its mood; hankering here and there, not to be away yet; and then, by the doing of its own work, led to a swift perplexity of ripples. Here along its side, and there softly leaning over it, fresh green meadows lie reposing in the settled meaning of the summer day. For this is a safer time of year than the flourish of the spring-tide, when the impulse of young warmth awaking was suddenly smitten by the bleak east wind, and cowslip and cuckoo-flower and speedwell got their bright lips browned with cold. Then, moreover, must the meads have felt the worry of scarcely knowing yet what would be demanded of them; whether to carry an exacting load of hay, or only to feed a few sauntering cows.

But now every trouble has been settled for the best; the long grass is mown, and the

short grass browsed, and capers of the fairies and caprices of the cows have dappled worn texture with a deeper green. Therefore let eyes that are satisfied here—as any but a very bad eye must be, with so many changes of softness—follow the sweet lead of the valley; and there, in a bend of the gently brawling river, stands the never-brawling church.

A church less troubled with the gift of tongues is not to be found in England: a church of gray stone that crumbles just enough to entice frail mortal sympathy, and confesses to the storms it has undergone in a tone that conciliates the human sigh. The tower is large, and high enough to tell what the way of the wind is without any potato-bury on the top, and the simple roof is not cruciated with tiles of misguided fancy. But gray rest, and peace of ages, and content of lying calmly six feet deeper than the bustle of the quick; memory also, and oblivion, following each other slowly, like the shadows of the church-yard trees—for all of these no better place can be, nor softer comfort.

For the village of Shoxford runs up on the rise, and straggles away from its burial-place, as a child from his school goes mitching. There are some few little ups and downs in the manner of its building, as well as in other particulars about it; but still it keeps as parallel with the crooked river as the far more crooked ways of men permit. But the whole of the little road of houses runs down the valley from the church-yard gate; and above the church, looking up the pretty valley, stands nothing but the mill and the plank bridge below it; and a furlong above that again the stone bridge, where the main road crosses the stream, and is consoled by leading to a big house—the Moonstock Inn.

The house in which my father lived so long—or rather, I should say, my mother, while he was away with his regiment—and where we unfortunate seven saw the light, stands about half-way down the little village, being on the right-hand side of the road as you come down the valley from the Moonstock bridge. Therefore it is on the further and upper side of the street—if it can be called a street—from the valley and the river and the meads below the mill, inasmuch as every bit of Shoxford, and every particle of the parish also, has existence—of no mean sort, as compared with other parishes, in its own esteem—on the right side of the river Moon.

My father's house, in this good village, standing endwise to the street, was higher at one end than at the other. That is to say, the ground came sloping, or even falling, as fairly might be said, from one end to the other of it, so that it looked like a Noah's ark tilted by Behemoth under the stern-post. And a little lane, from a finely wooded

hill, here fell steeply into the "High Street" (as the grocer and the butcher loved to call it), and made my father's house most distinct, by obeying a good deal of its outline, and discharging in heavy rain a free supply of water under the weather-board of our front-door. This front-door opened on the little steep triangle formed by the meeting of lane and road, while the back-door led into a long but narrow garden running along the road, but raised some feet above it; the bank was kept up by a rough stone wall crested with stuck-up snap-dragon and valerian, and faced with rosettes and disks and dills of houseleek, pennywort, and hart's-tongue.

Betsy and I were only just in time to see the old house as it used to be; for the owner had died about half a year ago, and his grandson, having proved his will, was resolved to make short work with it. The poor house was blamed for the sorrows it had sheltered, and had the repute of two spectres, as well as the pale shadow of misfortune. For my dear father was now believed by the superstitious villagers to haunt the old home of his happiness and love, and roam from room to room in search of his wife and all his children. But his phantom was most careful not to face that of his father, which stalked along haughtily, as behooved a lord, and pointed forever to a red wound in its breast. No wonder, therefore, that the house would never let; and it would have been pulled down long ago if the owner had not felt a liking for it, through memories tender and peculiar to himself. His grandson, having none of these to contend with, resolved to make a mere stable of it, and build a public-house at the bottom of the garden, and turn the space between them into skittle-ground, and so forth.

To me this seemed such a very low idea, and such a desecration of a sacred spot, that if I had owned any money to be sure of, I would have offered hundreds to prevent it. But I found myself now in a delicate state of mind concerning money, having little of my own, and doubting how much other people might intend for me. So that I durst not offer to buy land and a house without any means to pay.

And it was not for that reason only that Betsy and I kept ourselves quiet. We knew that any stir in this little place about us—such as my name might at once set going—would once for all destroy all hope of doing good by coming. Betsy knew more of such matters than I did, besides all her knowledge of the place itself, and her great superiority of age; therefore I left to her all little management, as was in every way fair and wise. For Mrs. Strouss had forsaken a large and good company of lodgers, with only Herr Strouss to look after them—and who was he among them? If she trod on one side of her foot, or felt a tingling in her

hand, or a buzzing in her ear, she knew in a moment what it was—of pounds and pounds was she being cheated, a hundred miles off, by foreigners!

For this reason it had cost much persuasion and many appeals to her faithfulness, as well as considerable weekly payment, ere ever my good nurse could be brought away from London; and perhaps even so she never would have come if I had not written myself to Mrs. Price, then visiting Betsy in European Square, that if the landlady was too busy to be spared by her lodgers, I must try to get Lord Castlewood to spare me his housekeeper. Upon this Mrs. Strouss at once declared that Mrs. Price would ruin every thing; and rather than that—no matter what she lost—she herself would go with me. And so she did, and she managed very well, keeping my name out of sight (for, happen what might, I would have no false one); and she got quiet lodgings in her present name, which sounded nicely foreign; and the village being more agitated now about my father's material house, and the work they were promised in pulling it down, than about his shattered household, we had a very favorable time for coming in, and were pronounced to be foreigners who must not be allowed to run up bills.

This rustic conclusion suited us quite well, and we soon confirmed it unwittingly, Betsy offering a German thaler and I an American dollar at the shop of the village chandler and baker, so that we were looked upon with some pity, and yet a kind desire for our custom. Thus, without any attempt of ours at either delusion or mystery, Mrs. Strouss was hailed throughout the place as "Madam Straw," while I, through the sagacity of a deeply read shoe-maker, obtained a foreign name, as will by-and-by appear.

We lodged at the post-office, not through any wisdom or even any thought on our part, but simply because we happened there to find the cleanest and prettiest rooms in the place. For the sun being now in the height of August, and having much harvest to ripen, at middle day came ramping down the little street of Shoxford like the chairman of the guild of bakers. Every house having lately brightened up its whitewash—which they always do there when the frosts are over, soon after the feast of St. Barnabas—and the weeds of the way having fared amiss in the absence of any water-cart, it was not in the strong, sharp character of the sun to miss such an opportunity. After the red Californian glare, I had no fear of any English sun; but Betsy was frightened, and both of us were glad to get into a little place sheltered by green blinds. This chanced to be the post-office, and there we found nice lodgings.

By an equal chance this proved to be the

wisest thing we could possibly have done, if we had set about it carefully. For why, that nobody ever would impute any desire of secrecy to people who straightway unpacked their boxes at the very head-quarters of all the village news. And the mistress of the post was a sharp-tongued woman, pleased to speak freely of her neighbors' doings, and prompt with good advice that they should heed their own business, if any of them durst say a word about her own. She kept a tidy little shop, showing something of almost every thing; but we had a side door, quite of our own, where Betsy met the baker's wife and the veritable milkman; and neither of them knew her, which was just what she had hoped; and yet it made her speak amiss of them.

But if all things must be brought to the harsh test of dry reason, I myself might be hard pushed to say what good I hoped to do by coming thus to Shoxford. I knew of a great many things, for certain, that never had been thoroughly examined here; also I naturally wished to see, being a native, what the natives were; and, much more than that, it was always on my mind that here lay my mother and the other six of us.

Therefore it was an impatient thing for me to hear Betsy working out the afternoon with perpetual chatter and challenge of prices, combating now as a lodger all those points which as a landlady she never would allow even to be moot questions. If any applicant in European Square had dared so much as hint at any of all the requirements which she now expected gratis, she would simply have whisked her duster, and said that the lodgings for such people must be looked for down the alley. However, Mrs. Busk, our new landlady, although she had a temper of her own (as any one keeping a post-office must have) was forced by the rarity of lodgers here to yield many points, which Mrs. Strouss, on her own boards, would not even have allowed to be debated. All this was entirely against my wish; for when I have money, I spend it, finding really no other good in it; but Betsy told me that the purest principle of all was—not to be cheated.

So I left her to have these little matters out, and took that occasion for stealing away (as the hours grew on toward evening) to a place where I wished to be quite alone. And the shadow of the western hills shed peace upon the valley, when I crossed a little stile leading into Shoxford church-yard.

For a minute or two I was quite afraid, seeing nobody any where about, nor even hearing any sound in the distance to keep me company. For the church lay apart from the village, and was thickly planted out from it, the living folk being full of superstition, and deeply believing in the dead people's ghosts. And even if this were a

wife to a husband, or even a husband re-appearing to his wife, there was not a man or a woman in the village that would not run away from it.

This I did not know at present, not having been there long enough; neither had I any terror of that sort, not being quite such a coward, I should hope. But still, as the mantles of the cold trees darkened, and the stony remembrance of the dead grew pale, and of the living there was not even the whistle of a grave-digger—my heart got the better of my mind for a moment, and made me long to be across that stile again. Because (as I said to myself) if there had been a hill to go up, that would be so different and so easy; but going down into a place like this, whence the only escape must be by steps, and where any flight must be along channels that run in and out of graves and tombstones, I tried not to be afraid, yet could not altogether help it.

But lo! when I came to the north side of the tower, scarcely thinking what to look for, I found myself in the middle of a place which made me stop and wonder. Here were six little grassy tuffets, according to the length of children, all laid east and west, without any stint of room, harmoniously.

From the eldest to the youngest, one could almost tell the age at which their lowly stature stopped, and took its final measurement.

And in the middle was a larger grave, to comfort and encourage them, as a hen lies down among her chicks and waits for them to shelter. Without a name to any of them, all these seven graves lay together, as in a fairy ring of rest, and kind compassion had prevented any stranger from coming to be buried there.

I would not sit on my mother's grave for fear of crushing the pretty grass, which some one tended carefully; but I stood at its foot, and bent my head, and counted all the little ones. Then I thought of my father in the grove of peaches, more than six thousand miles away, on the banks of the soft Blue River. And a sense of desolate sorrow and of the blessing of death overwhelmed me.

CHAPTER XXXV.

THE SEXTON.

WITH such things in my mind, it took me long to come back to my work again. It even seemed a wicked thing, so near to all these proofs of God's great visitation over us, to walk about and say, "I will do this," or even to think, "I will try to do that." My own poor helplessness, and loss of living love to guide me, laid upon my heart a weight from which it scarcely cared to move. All was buried, all was done with,

all had passed from out the world, and left no mark but graves behind. What good to stir anew such sadness, even if a poor weak thing like me could move its mystery?

Time, however, and my nurse Betsy, and Jacob Rigg the gardener, brought me back to a better state of mind, and renewed the right courage within me. But, first of all, Jacob Rigg aroused my terror and interest vividly. It may be remembered that this good man had been my father's gardener at the time of our great calamity, and almost alone of the Shoxford people had shown himself true and faithful. Not that the natives had turned against us, or been at all unfriendly; so far from this was the case, that every one felt for our troubles, and pitied us, my father being of a cheerful and affable turn, until misery hardened him; but what I mean is that only one or two had the courage to go against the popular conclusion and the convictions of authority.

But Jacob was a very upright man, and had a strong liking for his master, who many and many a time—as he told me—had taken a spade and dug along with him, just as if he were a jobbing gardener born, instead of a fine young nobleman; "and nobody gifted with that turn of mind, likewise very clever in white-spine cowcubers, could ever be relied upon to go and shoot his father." Thus reasoned old Jacob, and he always had done so, and meant evermore to abide by it; and the graves which he had tended now for nigh a score of years, and meant to tend till he called for his own, were—as sure as he stood there in Shoxford church-yard a-talking to me, who was the very image of my father, God bless me, though not of course so big like—the graves of slaughtered innocents, and a mother who was always an angel. And the parson might preach forever to him about the resurrection, and the right coming uppermost when you got to heaven, but to his mind that was scarcely any count at all; and if you came to that, we ought to hang Jack Ketch, as might come to pass in the Revelations. But while a man had got his own bread to earn, till his honor would let him go to the work-house, and his duty to the rate-payers, there was nothing that vexed him more than to be told any texts of Holy Scripture. Whatever God Almighty had put down there was meant for ancient people, the Jews being long the most ancient people, though none the more for that did he like them; and so it was mainly the ancient folk, who could not do a day's work worth eighteenpence, that could enter into Bible promises. Not that he was at all behindhand about interpretation; but as long as he could fetch and earn, at planting box and doing borders, two shillings and ninepence a day and his beer, he was not going to be on for kingdom come.

I told him that I scarcely thought his

view of our condition here would be approved by wise men who had found time to study the subject. But he answered that whatever their words might be, their doings showed that they knew what was the first thing to attend to. And if it ever happened him to come across a parson who was as full of heaven outside as he was inside his surplice, he would keep his garden in order for nothing better than his blessing.

I knew of no answer to be made to this. And indeed he seemed to be aware that his conversation was too deep for me; so he leaned upon his spade, and rubbed his long blue chin in the shadow of the church tower, holding as he did the position of sexton, and preparing even now to dig a grave.

"I keeps them well away from you," he said, as he began to chop out a new oblong in the turf; "many a shilling have I been offered by mothers about their little ones, to put 'em inside of the 'holy ring,' as we calls this little cluster; but not for five golden guineas would I do it, and have to face the Captain, dead or alive, about it. We heard that he was dead, because it was put in all the papers; and a pleasant place I keeps for him, to come home alongside of his family. A nicer gravelly bit of ground there couldn't be in all the county; and if no chance of him occupying it, I can drive down a peg with your mark, miss."

"Thank you," I answered; "you are certainly most kind; but, Mr. Rigg, I would rather wait a little. I have had a very troublesome life thus far, and nothing to bind me to it much; but still I would rather not have my peg driven down just—just at present."

"Ah, you be like all the young folk that think the tree for their coffins ain't come to the size of this spade handle yet. Lord bless you for not knowing what He hath in hand! Now this one you see me a-raising of the turf for, stood as upright as you do, a fortnight back, and as good about the chest and shoulders, and three times the color in her cheeks, and her eyes a'most as bright as yourn be. Not aristocratic, you must understand me, miss, being only the miller's daughter, nor instructed to throw her voice the same as you do, which is better than gallery music; but setting these haxidents to one side, a farmer would have said she was more preferable, because more come-at-able, though not in my opinion to be compared—excuse me for making so free, miss, but when it comes to death we has a kind of right to do it—and many a young farmer, coming to the mill, was disturbed in his heart about her, and far and wide she was known, being proud, as the Beauty of the Moonshine, from the name of our little river. She used to call me 'Jacob Diggs,' because of my parochial office, with a meaning of a joke on my parenschal name. Ah, what

a merry one she were! And now this is what I has to do for her! And sooner would I 'a doed it a'most for my own old ooman!"

"Oh, Jacob!" I cried, being horrified at the way in which he tore up the ground, as if his wife was waiting, "the things you say are quite wrong, I am sure, for a man in your position. You are connected with this church almost as much as the clerk is."

"More, miss, ten times more! He don't do nothing but lounge on the front of his desk, and be too lazy to keep up 'Amen,' while I at my time of life go about, from Absolution to the fifth Lord's prayer, with a stick that makes my rheumatics worse, for the sake of the boys with their pocket full of nuts. When I was a boy there was no nuts, except at the proper time of year, a month or two on from this time of speaking; and we used to crack they in the husk, and make no noise to disturb the congregation; but now it is nuts, nuts, round nuts, flat nuts, nuts with three corners to them—all the year round nuts to crack, and me to find out who did it!"

"But, Mr. Rigg," I replied, as he stopped, looking hotter in mind than in body, "is it not Mrs. Rigg, your good wife, who sells all the nuts on a Saturday for the boys to crack on a Sunday?"

"My missus do sell some, to be sure; yes, just a few. But not of a Saturday more than any other day."

"Then surely, Mr. Rigg, you might stop it, by not permitting any sale of nuts except to good boys of high principles. And has it not happened sometimes, Mr. Rigg, that boys have made marks on their nuts, and bought them again at your shop on a Monday? I mean, of course, when your duty has compelled you to empty the pockets of a boy in church."

Now this was a particle of shamefully small gossip, picked up naturally by my Betsy, but pledged to go no further; and as soon as I had spoken I became a little nervous, having it suddenly brought to my mind that I had promised not even to whisper it; and now I had told it to the man of all men! But Jacob appeared to have been quite deaf, and diligently went on digging. And I said "good-evening," for the grave was for the morrow; and he let me go nearly to the stile before he stuck his spade into the ground and followed.

"Excuse of my making use," he said, "of a kind of a personal reference, miss; but you be that pat with your answers, it maketh me believe you must be sharp inside—more than your father, the poor Captain, were, as all them little grass buttons argueth. Now, miss, if I thought you had head-piece enough to keep good counsel and ensue it, maybe I could tell you a thing as would make your hair creep out of them

coorous hitch-ups, and your heart a'most bust them there braids of fallallies."

"Why, what in the world do you mean?" I asked, being startled by the old man's voice and face.

"Nothing, miss, nothing. I was only a-joking. If you bain't come to no more discretion than that—to turn as white as the clerk's smock-frock of a Easter-Sunday—why, the more of a joke one has, the better, to bring your purty color back to you. Ah! Polly of the mill was the maid for color—as good for the eyesight as a chane-rose in April. Well, well, I must get on with her grave; they're a-coming to speak the good word over un on sundown."

He might have known how this would vex and perplex me. I could not bear to hinder him in his work—as important as any to be done by man for man—and yet it was beyond my power to go home and leave him there, and wonder what it was that he had been so afraid to tell. So I quietly said, "Then I will wish you a very good evening again, Mr. Rigg, as you are too busy to be spoken with." And I walked off a little way, having met with men who, having begun a thing, needs must have it out, and fully expecting him to call me back. But Jacob only touched his hat, and said, "A pleasant evening to you, ma'am."

Nothing could have made me feel more resolute than this did. I did not hesitate one moment in running back over the stile again, and demanding of Jacob Rigg that he should tell me whether he meant any thing or nothing; for I was not to be played with about important matters, like the boys in the church who were cracking nuts.

"Lord! Lord, now!" he said, with his treddled heel scraping the shoulder of his shining spade; "the longer I live in this world, the fitter I grow to get into the ways of the Lord. His ways are past finding out, saith King David: but a man of war, from his youth upward, hath no chance such as a gardening man hath. What a many of them have I found out!"

"What has that got to do with it?" I cried. "Just tell me what it was you were speaking of just now."

"I was just a-thinking, when I looked at you, miss," he answered, in the prime of leisure, and wiping his forehead from habit only, not because he wanted it, "how little us knows of the times and seasons and the generations of the sons of men. There you stand, miss, and here stand I, as haven't seen your father for a score of years a'most; and yet there comes out of your eyes into mine the very same look as the Captain used to send, when snakes in the grass had been telling lies about me coming late, or having my half pint or so on. Not that the Captain was a hard man, miss—far otherwise, and capable of allowance, more than any

of the women be. But only the Lord, who doeth all things aright, could 'a made you come, with a score of years atween, and the twinkle in your eyes like—Selah!"

"You know what you mean, perhaps, but I do not," I answered, quite gently, being troubled by his words and the fear of having tried to hurry him; "but you should not say what you have said, Jacob Rigg, to me, your master's daughter, if you only meant to be joking. Is this the place to joke with me?"

I pointed to all that lay around me, where I could not plant a foot without stepping over my brothers or sisters; and the old man, callous as he might be, could not help feeling for—a pinch of snuff. This he found in the right-hand pocket of his waistcoat, and took it very carefully, and made a little noise of comfort; and thus, being fully self-assured again, he stood, with his feet far apart and his head on one side, regarding me warily. And I took good care not to say another word.

"You be young," he said at last; "and in these latter days no wisdom is ordained in the mouths of babes and sucklings, nor always in the mouths of them as is themselves ordained. But you have a way of keeping your chin up, miss, as if you was gifted with a stiff tongue likewise. And whatever may hap, I has as good mind to tell 'e."

"That you are absolutely bound to do," I answered, as forcibly as I could. "Duty to your former master and to me, his only child—and to yourself, and your Maker too—compel you, Jacob Rigg, to tell me every thing you know."

"Then, miss," he answered, coming nearer to me, and speaking in a low, hoarse voice, "as sure as I stand here in God's churchyard, by all this murdered family, I knows the man who done it!"

He looked at me, with a trembling finger upon his hard-set lips, and the spade in his other hand quivered like a wind vane; but I became as firm as the monument beside me, and my heart, instead of fluttering, grew as steadfast as a glacier. Then, for the first time, I knew that God had not kept me living, when all the others died, without fitting me also for the work there was to do.

"Come here to the corner of the tower, miss," old Jacob went on, in his excitement catching hold of the sleeve of my black silk jacket. "Where we stand is a queer sort of echo, which goeth in and out of them big tombstones. And for aught I can say to contrary, he may be a-watching of us while here we stand."

I glanced around, as if he were most welcome to be watching me, if only I could see him once. But the place was as silent as its graves; and I followed the sexton to the shadow of a buttress. Here he went into a

deep gray corner, lichened and mossed by a drip from the roof; and being, both in his clothes and self, pretty much of that same color, he was not very easy to discern from stone when the light of day was declining.

"This is where I catches all the boys," he whispered; "and this is where I caught him, one evening when I were tired, and gone to nurse my knees a bit. Let me see—why, let me see! Don't you speak till I do, miss. Were it the last but one I dug? Or could un 'a been the last but two? Never mind; I can't call to mind quite justly. We puts down about one a month in this parish, without any distemper or haxident. Well, it must 'a been the one afore last—to be sure, no call to scratch my head about un. Old Sally Mock, as sure as I stand here—done handsome by the rate-payers. Over there, miss, if you please to look—about two land-yard and a half away. Can you see un with the grass peeking up a'ready?"

"Never mind that, Jacob. Do please to go on."

"So I be, miss. So I be doing to the best of the power granted me. Well, I were in this little knuckle of a squat, where old Sally used to say as I went to sleep, and charged the parish for it—a spiteful old ooman, and I done her grave with pleasure, only wishing her had to pay for it; and to prove to her mind that I never goed asleep here, I was just making ready to set fire to my pipe, having cocked my shovel in to ease my legs, like this, when from round yon corner of the chancel-foot, and over again that there old tree, I seed a something movin' along—movin' along, without any noise or declarance of solid feet walking. You may see the track burnt in the sod, if you let your eyes go along this here finger."

"Oh, Jacob, how could you have waited to see it?"

"I did, miss, I did; being used to a many antics in this dead-yard, such as a man who hadn't buried them might up foot to run away from. But they no right, after the service of the Church, to come up for more than one change of the moon, unless they been great malefactors. And then they be ashamed of it; and I reminds them of it. 'Amen,' I say, in the very same voice as I used at the tail of their funerals; and then they knows well that I covered them up, and the most uneasy goes back again. Lor' bless you, miss, I no fear of the dead. At both ends of life us be harmless. It is in the life, and mostways in the middle of it, we makes all the death for one another."

This was true enough; and I only nodded to him, fearing to interject any new ideas from which he might go rambling.

"Well, that there figure were no joke, mind you," the old man continued, as soon as he had freshened his narrative powers

with another pinch of snuff, "being tall and grim, and white in the face, and very unpleasant for to look at, and its eyes seemed a'most to burn holes in the air. No sooner did I see that it were not a ghostie, but a living man the same as I be, than my knees begins to shake and my stumps of teeth to chatter. And what do you think it was stopped me, miss, from slipping round this corner, and away by belfry? Nort but the hoddest idea you ever heard on. For all of a suddint it was borne unto my mind that the Lord had been pleased to send us back the Captain; not so handsome as he used to be, but in the living flesh, however, in spite of they newspapers. And I were just at the pint of coming forrard, out of this here dark cornder, knowing as I had done my duty by them graves that his honor, to my mind, must 'a come looking after, when, lucky for me, I see summat in his walk, and then in his countenance, and then in all his features, unnatural on the Captain's part, whatever his time of life might be. And sure enough, miss, it were no Captain more nor I myself be."

"Of course not. How could it be? But who was it, Jacob?"

"You bide a bit, miss, and you shall hear the whole. Well, by that time 'twas too late for me to slip away, and I was bound to scrooge up into the elbow of this nick here, and try not to breathe, as nigh as might be, and keep my Lammas cough down; for I never see a face more full of malice and uncharity. However, he come on as straight as a arrow, holding his long chin out, like this, as if he gotten crutches under it, as the folk does with bad water. A tall man, as tall as the Captain a'most, but not gifted with any kind aspect. He tramped over the general graves, like the devil come to fetch their souls out; but when he come here to the 'holy ring,' he stopped short, and stood with his back to me. I could hear him count the seven graves, as pat as the shells of oysters to pay for, and then he said all their names, as true, from the biggest to the leastest one, as Betsy Bowen could 'a done it, though none of 'em got no mark to 'em. Oh, the poor little hearts, it was cruel hard upon them! And then my lady in the middle, making seven. So far as I could catch over his shoulder, he seemed to be quite a-talking with her—not as you and I be, miss, but a sort of a manner of a way, like."

"And what did he seem to say? Oh, Jacob, how long you do take over it!"

"Well, he did not, miss; that you may say for sartain. And glad I was to have him quick about it; for he might have redooced me to such a condition—ay, and I believe a' would, too, if onst a' had caught sight of me—as the parish might 'a had to fight over the appintment of another sexton. And

so at last a' went away. And I were that stiff with scrooging in this cornder—"

"Is that all? Oh, that comes to nothing. Surely you must have more to tell me? It may have been some one who knew our names. It may have been some old friend of the family."

"No, miss, no! No familiar friend; or if he was, he were like King David's. He bore a tyrannous hate against 'e, and the poison of asps were under his lips. In this here hattitude he stood, with his back toward me, and his reins more upright than I be capable of putting it. And this was how he held up his elbow and his head. Look 'e see, miss, and then 'e know as much as I do."

Mr. Rigg marched with a long smooth step—a most difficult strain for his short bowed legs—as far as the place he had been pointing out; and there he stood with his back to me, painfully doing what the tall man had done, so far as the difference of size allowed.

It was not possible for me, to laugh in a matter of such sadness; and yet Jacob stood, with his back to me, spreading and stretching himself in such a way, to be up to the dimensions of the stranger, that—low as it was—I was compelled to cough, for fear of fatally offending him.

"That warn't quite right, miss. Now you look again," he exclaimed, with a little readjustment. "Only he had a thing over one shoulder, the like of what the Scotchmen wear; and his features was beyond me, because of the back of his head, like. For God's sake keep out of his way, miss."

The sexton stood in a musing and yet a stern and defiant attitude, with the right elbow clasped in the left-hand palm, the right hand resting half-clinched upon the forehead, and the shoulders thrown back, as if ready for a blow.

"What a very odd way to stand!" I said.

"Yes, miss. And what he said was odder. 'Six, and the mother! I heared un say; 'no cure for it, till I have all seven.' But stop, miss. Not a breath to any one! Here comes the poor father and mother to speak the blessing across their daughter's grave—and the grave not two foot down yet!"

CHAPTER XXXVI.

A SIMPLE QUESTION.

Now this account of what Jacob Rigg had seen and heard threw me into a state of mind extremely unsatisfactory. To be in eager search of some unknown person who had injured me inexpressibly, without any longing for revenge on my part, but simply with a view to justice—this was a very different thing from feeling that an unknown person was in quest of me, with the horrible

purpose of destroying me to insure his own wicked safety.

At first I almost thought that he was welcome to do this; that such a life as mine (if looked at from an outer point of view) was better to be died than lived out. Also that there was nobody left to get any good out of all that I could do; and even if I ever should succeed, truth would come out of her tomb too late. And this began to make me cry, which I had long given over doing, with no one to feel for the heart of it.

But a thing of this kind could not long endure; and as soon as the sun of the morrow arose (or at least as soon as I was fit to see him), my view of the world was quite different. Here was the merry brook, playing with the morning, spread around with ample depth and rich retreat of meadows, and often, after maze of leisure, hastening with a tinkle into shadowy delight of trees. Here, as well, were happy lanes, and foot-paths of a soft content, unworn with any pressure of the price of time or business. None of them knew (in spite, at flurried spots, of their own direction posts) whence they were coming or whither going—only that here they lay, between the fields or through them, like idle veins of earth, with sometimes company of a man or boy, whistling to his footfall, or a singing maid with a milking pail. And how ungrateful it would be to forget the pleasant copses, in waves of deep green leafage flowing down and up the channeled hills, waving at the wind to tints and tones of new refreshment, and tempting idle folk to come and hear the hush, and see the twinkled texture of pellucid gloom.

Much, however, as I loved to sit in places of this kind alone, for some little time I feared to do so, after hearing the sexton's tale; for Jacob's terror was so unfeigned (though his own life had not been threatened) that, knowing as I did from Betsy's account, as well as his own appearance, that he was not at all a nervous man, I could not help sharing his vague alarm. It seemed so terrible that any one should come to the graves of my sweet mother and her six harmless children, and, instead of showing pity, as even a monster might have tried to do, should stand, if not with threatening gestures, yet with a most hostile mien, and thirst for the life of the only survivor—my poor self.

But terrible or not, the truth was so; and neither Betsy nor myself could shake Mr. Rigg's conclusion. Indeed, he became more and more emphatic, in reply to our doubts and mild suggestions, perhaps that his eyes had deceived him, or perhaps that, taking a nap in the corner of the buttress, he had dreamed at least a part of it. And Betsy, on the score of ancient friendship and kind remembrance of his likings, put it to him in a gentle way whether his knowledge of what Sally Mock had been, and the calum-

nies she might have spoken of his beer (when herself, in the work-house, deprived of it), might not have induced him to take a little more than usual in going down so deep for her. But he answered, "No; it was nothing of the sort. Deep he had gone, to the tiptoe of his tling; not from any feeling of a wish to keep her down, but just because the parish paid, and the parish would have measurement. And when that was on, he never brought down more than the quart tin from the public; and never had none down afterward. Otherwise the ground was so ticklish, that a man, working too free, might stay down there. No, no! That idea was like one of Sally's own. He just had his quart of Persfield ale—short measure, of course, with a woman at the bar—and if that were enough to make a man dream dreams, the sooner he dug his own grave, the better for all connected with him."

We saw that we had gone too far in thinking of such a possibility; and if Mr. Rigg had not been large-minded, as well as notoriously sober, Betsy might have lost me all the benefit of his evidence by her London-bred clumsiness with him. For it takes quite a different handling, and a different mode of outset, to get on with the London working class and the laboring kind of the country; or at least it seemed to me so.

Now my knowledge of Jacob Rigg was owing, as might be supposed, to Betsy Strouss, who had taken the lead of me in almost every thing ever since I brought her down from London. And now I was glad that, in one point at least, her judgment had overruled mine—to wit, that my name and parentage were as yet not generally known in the village. Indeed, only Betsy herself and Jacob and a faithful old washer-woman, with no roof to her mouth, were aware of me as Miss Castlewood. Not that I had taken any other name—to that I would not stoop—but because the public, of its own accord, paying attention to Betsy's style of addressing me, followed her lead (with some little improvement), and was pleased to entitle me "Miss Raumur."

Some question had been raised as to spelling me aright, till a man of advanced intelligence proved to many eyes, and even several pairs of spectacles (assembled in front of the blacksmith's shop), that no other way could be right except that. For there it was in print, as any one able might see, on the side of an instrument whose name and qualities were even more mysterious than those in debate. Therefore I became "Miss Raumur;" and a protest would have gone for nothing unless printed also. But it did not behoove me to go to that expense, while it suited me very well to be considered and pitied as a harmless foreigner—a being who on English land may find some cause to doubt whether, even in his own country, a

prophet could be less thought of. And this large pity for me, as an outlandish person, in the very spot where I was born, endowed me with tenfold the privilege of the proudest native. For the natives of this valley are declared to be of a different stock from those around them, not of the common Wessex strain, but of Jutish or Danish origin. How that may be I do not know; at any rate, they think well of themselves, and no doubt they have cause to do so.

Moreover, they all were very kind to me, and their primitive ways amused me, as soon as they had settled that I was a foreigner, equally beyond and below inquiry. They told me that I was kindly welcome to stay there as long as it pleased me; and knowing how fond I was of making pictures, after beholding my drawing-book, every farmer among them gave me leave to come into his fields, though he never had heard there was any thing there worth painting.

When once there has been a deposit of idea in the calm deep eocene of British rural mind, the impression will outlast any shallow deluge of the noblest education. Shoxford had settled two points forever, without troubling reason to come out of her way—first, that I was a foreign young lady of good birth, manners, and money; second, and far more important, I was here to write and paint a book about Shoxford. Not for the money, of that I had no need (according to the congress at the "Silver-edged Holly"), but for the praise and the knowledge of it, like, and to make a talk among high people. But the elders shook their heads—as I heard from Mr. Rigg, who hugged his knowledge proudly, and uttered dim sayings of wisdom let forth at large usury: he did not mind telling me that the old men shook their heads, for fear of my being a deal too young, and a long sight too well favored (as any man might tell without his spees on), for to write any book upon any subject yet, leave alone an old, ancient town like theirs. However, there might be no harm in my trying, and perhaps the school-master would cross out the bad language.

Thus for once fortune now was giving me good help, enabling me to go about freely, and preventing (so far as I could see, at least) all danger of discovery by my unknown foe. So here I resolved to keep my head-quarters, dispensing, if it must be so, with Betsy's presence, and not even having Mrs. Price to succeed her, unless my cousin should insist upon it. And partly to dissuade him from that, and partly to hear his opinion of the sexton's tale, I paid a flying visit to Lord Castlewood; while "Madam Straw," as Betsy now was called throughout the village, remained behind at Shoxford. For I long had desired to know a thing which I had not ventured to ask my cousin—though I did ask Mr. Shovelin—whether my father

had intrusted him with the key of his own mysterious acts. I scarcely knew whether it was proper even now to put this question to Lord Castlewood; but even without doing so, I might get at the answer by watching him closely while I told my tale. Not a letter had reached me since I came to Shoxford, neither had I written any, except one to Uncle Sam; and keeping to this excellent rule, I arrived at Castlewood without notice.

In doing this I took no liberty, because full permission had been given me about it; and indeed I had been expected there, as Stixon told me, some days before. He added that his master was about as usual, but had shown some uneasiness on my account, though the butler was all in the dark about it, and felt it very hard after all these years, "particular, when he could hardly help thinking that Mrs. Price—a new hand compared to himself, not to speak of being a female—knewed all about it, and were very aggravating. But there, he would say no more; he knew his place, and he always had been valued in it, long afore Mrs. Price come up to the bottom of his waistcoat."

My cousin received me with kindly warmth, and kissed me gently on the forehead. "My dear, how very well you look!" he said. "Your native air has agreed with you. I was getting, in my quiet way, rather sedulous and self-reproachful about you. But you would have your own way, like a young American; and it seems that you were right."

"It was quite right," I answered, with a hearty kiss, for I never could be cold-natured; and this was my only one of near kin, so far, at least, as my knowledge went. "I was quite right in going; and I have done good. At any rate, I have found out something—something that may not be of any kind of use; but still it makes me hope things."

With that, in as few words as ever I could use, I told Lord Castlewood the whole of Jacob's tale, particularly looking at him all the while I spoke, to settle in my own mind whether the idea of such a thing was new to him. Concerning that, however, I could make out nothing. My cousin, at his time of life, and after so much travelling, had much too large a share of mind and long skill of experience for me to make any thing out of his face beyond his own intention. And whether he had suspicion or not of any thing at all like what I was describing, or any body having to do with it, was more than I ever might have known, if I had not gathered up my courage and put the question outright to him. I told him that if I was wrong in asking, he was not to answer; but, right or wrong, ask him I must.

"The question is natural, and not at all improper," replied Lord Castlewood, standing a moment for change of pain, which was all his relief. "Indeed, I expected you to

ask me that before. But, Erema, I have also had to ask myself about it, whether I have any right to answer you. And I have decided not to do so, unless you will pledge yourself to one thing."

"I will pledge myself to any thing," I answered, rashly; "I do not care what it is, if only to get at the bottom of this mystery."

"I scarcely think you will hold good to your words when you hear what you have to promise. The condition upon which I tell you what I believe to be the cause of all is, that you let things remain as they are, and keep silence forever about them."

"Oh, you can not be so cruel, so atrocious!" I cried, in my bitter disappointment. "What good would it be for me to know things thus, and let the vile wrong continue? Surely you are not bound to lay on me a condition so impossible?"

"After much consideration and strong wish to have it otherwise, I have concluded that I am so bound."

"In duty to my father, or the family, or what? Forgive me for asking, but it does seem so hard."

"It seems hard, my dear, and it is hard as well," he answered, very gently, yet showing in his eyes and lips no chance of any yielding. "But remember that I do not know, I only guess, the secret; and if you give the pledge I speak of, you merely follow in your father's steps."

"Never," I replied, with as firm a face as his. "It may have been my father's duty, or no doubt he thought it so; but it can not be mine, unless I make it so by laying it on my honor. And I will not do that."

"Perhaps you are right; but, at any rate, remember that I have not tried to persuade you. I wish to do what is for your happiness, Erema. And I think that, on the whole, with your vigor and high spirit, you are better as you are than if you had a knowledge which you could only brood over and not use."

"I will find out the whole of it myself," I cried, for I could not repress all excitement; "and then I need not brood over it, but may have it out and get justice. In the wildest parts of America justice comes with perseverance: am I to abjure it in the heart of England? Lord Castlewood, which is first—justice or honor?"

"My cousin, you are fond of asking questions difficult to answer. Justice and honor nearly always go together. When they do otherwise, honor stands foremost, with people of good birth, at least."

"Then I will be a person of very bad birth. If they come into conflict in my life, as almost every thing seems to do, my first thought shall be of justice; and honor shall come in as its ornament afterward."

"Erema," said my cousin, "your meaning is good, and at your time of life you can

scarcely be expected to take a dispassionate view of things."

At first I felt almost as if I could hate a "dispassionate view of things." Things are made to arouse our passion, so long as meanness and villainy prevail; and if old men, knowing the balance of the world, can contemplate them all "dispassionately," more clearly than any thing else, to my mind, that proves the beauty of being young. I am sure that I never was hot or violent—qualities which I especially dislike—but still I would rather almost have those than be too philosophical. And now, while I revered my father's cousin for his gentleness, wisdom, and long-suffering, I almost longed to fly back to the Major, prejudiced, peppery, and red-hot for justice, at any rate in all things that concerned himself.

CHAPTER XXXVII.

SOME ANSWER TO IT.

HASTY indignation did not drive me to hot action. A quiet talk with Mrs. Price, as soon as my cousin's bad hour arrived, was quite enough to bring me back to a sense of my own misgovernment. Moreover, the evening clouds were darkening for a night of thunder, while the silver Thames looked nothing more than a leaden pipe down the valleys. Calm words fall at such times on quick temper like the drip of trees on people who have been dancing. I shivered, as my spirit fell, to think of my weak excitement, and poor petulance to a kind, wise friend, a man of many sorrows and perpetual affliction. And then I recalled what I had observed, but in my haste forgotten—Lord Castlewood was greatly changed even in the short time since I had left his house for Shoxford. Pale he had always been, and his features (calm as they were, and finely cut) seemed almost bleached by in-door life and continual endurance. But now they showed worse sign than this—a delicate transparence of faint color, and a waxen surface, such as I had seen at a time I can not bear to think of. Also he had tottered forward, while he tried for steadfast footing, quite as if his worried members were almost worn out at last.

Mrs. Price took me up quite sharply—at least for one of her well-trained style—when I ventured to ask if she had noticed this, which made me feel uneasy. "Oh dear, no!" she said, looking up from the lace-frilled pockets of her silk apron, which appeared to my mind perhaps a little too smart, and almost of a vulgar tincture; and I think that she saw in my eyes that much, and was vexed with herself for not changing it—"oh dear, no, Miss Castlewood! We who know and watch him should de-

tect any difference of that nature at the moment of its occurrence. His lordship's health goes vacillating; a little up now, and then a little down, like a needle that is mounted to show the dip of compass; and it varies according to the electricity, as well as the magnetic influence."

"What doctor told you that?" I asked, seeing in a moment that this housekeeper was dealing in quotation.

"You are very"—she was going to say "rude," but knew better when she saw me waiting for it—"well, you are rather brusque, as we used to call it abroad, Miss Castlewood; but am I incapable of observing for myself?"

"I never implied that," was my answer. "I believe that you are most intelligent, and fit to nurse my cousin, as you are to keep his house. And what you have said shows the clearness of your memory and expression."

"You are very good to speak so," she answered, recovering her temper beautifully, but, like a true woman, resolved not to let me know any thing more about it. "Oh, what a clap of thunder! Are you timid? This house has been struck three times, they say. It stands so prominently. It is this that has made my lord look so."

"Let us hope, then, to see him much better to-morrow," I said, very bravely, though frightened at heart, being always a coward of thunder. "What are these storms you get in England compared to the tropical outbursts? Let us open the window, if you please, and watch it."

"I hear myself called," Mrs. Price exclaimed. "I am sorry to leave you, miss. You know best. But please not to sit by an open window; nothing is more dangerous."

"Except a great bunch of steel keys," I replied; and gazing at her nice retreating figure, saw it quickened, as a flash of lightning passed, with the effort of both hands to be quit of something.

The storm was dreadful; and I kept the window shut, but could not help watching, with a fearful joy, the many-fingered hazy pale vibrations, the reflections of the levin in the hollow of the land. And sadly I began to think of Uncle Sam and all his goodness; and how in a storm, a thousandfold of this, he went down his valley in the torrent of the waves, and must have been drowned, and perhaps never found again, if he had not been wearing his leathern apron.

This made me humble, as all great thoughts do, and the sidelong drizzle in among the heavy rain (from the big drops jostling each other in the air, and dashing out splashes of difference) gave me an idea of the sort of thing I was—and how very little more. And feeling rather lonely in the turn that things had taken, I rang the bell for somebody; and up came Stixon.

"Lor', miss! Lor', what a burning shame of Prick!—'Prick' we call her, in our genial moments, hearing as the 'k' is hard in Celtic language; and all abroad about her husband. My very first saying to you was, not to be too much okkipied with her. Look at the pinafore on her! Lord be with me! If his lordship, as caught me, that day of this very same month fifty years, in the gooseberry bush—"

"To be sure!" I said, knowing that story by heart, together with all its embellishments; "but things are altered since that day. Nothing can be more to your credit, I am sure, than to be able to tell such a tale in the very place where it happened."

"But, Miss—Miss Erma, I ain't begun to tell it."

"Because you remember that I am acquainted with it. A thing so remarkable is not to be forgotten. Now let me ask you a question of importance; and I beg you, as an old servant of this family, to answer it carefully and truly. Do you remember any one, either here or elsewhere, so like my father, Captain Castlewood, as to be taken for him at first sight, until a difference of expression and of walk was noticed?"

Mr. Stixon looked at me with some surprise, and then began to think profoundly, and in doing so he supported his chin with one hand.

"Let me see—like the Captain?" He reflected slowly: "Did I ever see a gentleman like poor Master George, as was? A gentleman, of course, it must have been—and a very tall, handsome, straight gentleman, to be taken anyhow for young Master George. And he must have been very like him, too, to be taken for him by resemblance. Well then, miss, to the best of my judgment, I never did see such a gentleman."

"I don't know whether it was a gentleman or not," I answered, with some impatience at his tantalizing slowness; "but he carried his chin stretched forth—like this."

For Stixon's own attitude had reminded me of a little point in Jacob Rigg's description, which otherwise might have escaped me.

"Lor', now, and he carried his chin like that!" resumed the butler, with an increase of intelligence by no means superfluous. "Why, let me see, now, let me see. Something do come across my mind when you puts out your purty chin, miss; but there, it must have been a score of years ago, or more—perhaps five-and-twenty. What a daft old codger I be getting, surely! No wonder them new lights puts a bushel over me."

"No," I replied; "you are simply showing great power of memory, Stixon. And now please to tell me, as soon as you can, who it was—a tall man, remember, and a handsome one, with dark hair, perhaps, or

at any rate dark eyes—who resembled (perhaps not very closely, but still enough to mislead at a distance) my dear father—Master George, as you call him, for whose sake you are bound to tell me every thing you know. Now try to think—do please try your very best, for my sake."

"That I will, miss; that I will, with all my heart, with all my mind, with all my soul, and with all my strength, as I used to have to say with my hands behind my back, afore education were invented. Only please you to stand with your chin put out, miss, and your profield towards me. That is what brings it up, and nothing else at all, miss. Only, not to say a word of any sort to hurry me. A tracherous and a deep thing is the memory and the remembrance."

Mr. Stixon's memory was so deep that there seemed to be no bottom to it, or, at any rate, what lay there took a very long time to get at. And I waited, with more impatience than hope, the utterance of his researches.

"I got it now; I got it all, miss, clear as any pictur'!" the old man cried out, at the very moment when I was about to say, "Please to leave off; I am sure it is too much for you." "Not a pictur' in all of our gallery, miss, two-and-fifty of 'em, so clear as I see that there man, dark as it was, and a heavy wind a-blowing. What you call them things, miss, if you please, as comes with the sun, like a face upon the water? Wicked things done again the will of the Lord, and He makes them fade out afterwards."

"Perhaps you mean photographs. Is that the word?"

"The very word, and no mistake. A sinful trespass on the works of God, to tickle the vanity of gals. But he never spread himself abroad like them. They shows all their ear-rings, and their necks, and smiles. But he never would have shown his nose, if he could help it, that stormy night when I come to do my duty. He come into this house without so much as a 'by your leave' to nobody, and vexed me terrible accordingly. It was in the old lord's time, you know, miss, a one of the true sort, as would have things respectful, and knock down any man as soon as look. And it put me quite upon the touch-and-go, being responsible for all the footman's works, and a young boy promoted in the face of my opinion, having my own son worth a dozen of him. This made me look at the nature of things, miss, and find it on my conscience to be after every body."

"Yes, Stixon, yes! Now do go on. You must always have been, not only after, but a very long way after, every body."

"Miss Erma, if you throw me out, every word goes promiscuous. In a heffort of the mind like this it is every word, or no word. Now, did I see him come along the big pas-

sage?—a 'currydoor' they call it now, though no more curry in it than there is door. No, I never seed him come along the passage, and that made it more reproachful. He come out of a green-baize door—the very place I can point out to you, and the self-same door, miss, though false to the accuracy of the mind that knows it, by reason of having been covered up red, and all the brass buttons lost to it in them new-fangled upholsteries. Not that I see him come through, if you please, but the sway of the door, being double-jointed, was enough to show legs had been there. And knowing that my lord's private room was there, made me put out my legs quite wonderful."

"Oh, do please to put out your words half as quickly."

"No, miss, no. I were lissome in those days, though not so very stiff at this time of speaking, and bound to be guarded in the guidance of the tongue. And now, miss, I think if you please to hear the rest to-morrow, I could tell it better."

A more outrageous idea than this was never presented to me. Even if I could have tried to wait, this dreadful old man might have made up his mind not to open his lips in the morning, or, if he would speak, there might be nothing left to say. His memory was nursed up now, and my only chance was to keep it so. Therefore I begged him to please to go on, and no more would I interrupt him. And I longed to be ten years older, so as not to speak when needless.

"So then, Miss Erma, if I must go on," resumed the well-coaxed Stixon, "if my duty to the family driveth me to an 'arrowing subjeck, no words can more justly tell what come to pass than my language to my wife. She were alive then, the poor dear hangel, and the mother of seven children, which made me, by your leave comparing humble roofs with grandeur, a little stiff to him up stairs, as come in on the top of seven. For I said to my wife when I went home—sleeping out of the house, you see, miss, till the Lord was pleased to dissolve matrimony—'Polly,' I said, when I took home my supper, 'you may take my word for it there is something queer.' Not another word did I mean to tell her, as behooved my dooty. Howsoever, no peace was my lot till I made a clean bosom of it, only putting her first on the Testament, and even that not safe with most of them. And from that night not a soul has heard a word till it comes to you, miss. He come striding along, with his face muffled up, for all the world like a bugglar, and no more heed did he pay to me than if I was one of the pedestals. But I were in front of him at the door, and to slip out so was against all orders. So in front of him I stands, with my hand upon the handles, and meaning to have a word with him, to know who he was, and such like, and how he

comes there, and what he had been seeking, with the spoons and the forks and the gravies on my mind. And right I would have been in a court of law (if the lawyers was put out of it) for my hefforts in that situation. And then, what do you think he done, miss? So far from entering into any conversation with me, or hitting at me, like a man—which would have done good to think of—he send out one hand to the bottom of my vest—as they call it now in all the best livery tailors—and afore I could reason on it, there I was a-lying on a star in six colors of marble. When I come to think on it, it was but a push directed to a part of my system, and not a hit under the belt, the like of which no Briton would think of delivering. Nevertheless, there was no differ in what came to me, miss, and my spirit was roused, as if I had been hit foul by one of the prizemen. No time to get up, but I let out one foot at his long legs as a' was slipping through the door, and so nearly did I fetch him over that he let go his muffle to balance himself with the jamb, and same moment a strong rush of wind laid bare the whole of his wicked face to me. For a bad wicked face it was, as ever I did see; whether by reason of the kick I gave, and a splinter in the shin, or by habit of the mind, a proud and 'aughty and owdacious face, and, as I said to my poor wife, reminded me a little of our Master George; not in his ordinary aspect, to be sure, but as Master George might look if he was going to the devil. Pray excoose me, miss, for bad words, but no good ones will do justice. And so off he goes, after one look at me on the ground, not worth considering, with his chin stuck up, as if the air was not good enough to be breathed perpendiklar like."

"And of course you followed him," I exclaimed, perceiving that Stixon would allow me now to speak. "Without any delay you went after him."

"Miss Erma, you forget what my dooty was. My dooty was to stay by the door and make it fast, as custodian of all this mansion. No little coorosity, or private resentment, could 'a bórne me out in doing so. As an outraged man I was up for rushing out, but as a trusted official, and responsible head footman, miss—for I were not butler till nine months after that—my dooty was to put the big bolt in."

"And you did it, without even looking out to see if he tried to set the house on fire! Oh, Stixon, I fear that you were frightened."

"Now, Miss Erma, I calls it ungrateful, after all my hefforts to obleege you, to put a bad construction upon me. You hurts me, miss, in my tenderest parts, as I never thought Master George's darter would 'a doed. But there, they be none of them as they used to be! Master George would 'a said, if he ever had heard it, 'Stixon, my man, you have

acted for the best, and showed a sound discretion. Stixon,' he would have said, 'here's a George and Dragon in reward of your gallant conduct.' Ah, that sort of manliness is died out now."

This grated at first upon my feelings, because it seemed tainted with selfishness, and it did not entirely agree with my own recollections of my father. But still Mr. Stixon must have suffered severely in that conflict, and to blame him for not showing rashness was to misunderstand his position. And so, before putting any other questions to him, I felt in my pocket for a new half sovereign, which I hoped would answer.

Mr. Stixon received it in an absent manner, as if he were still in the struggle of his story, and too full of duty to be thankful. Yet I saw that he did not quite realize the truth of a nobly philosophic proverb—"the half is more than the whole." Nevertheless, he stowed away his half, in harmony with a good old English saying.

"Now, when you were able to get up at last," I inquired, with tender interest, "what did you see, and what did you do, and what conclusion did you come to?"

"I came to the conclusion, miss, that I were hurt considerable. Coorosity on my part were quenched by the way as I had to rub myself. But a man is a man, and the last thing to complain of is the exercise of his functions. And when I come round I went off to his lordship, as if I had heard his bell ring. All of us knew better than to speak till him beginning, for he were not what they now call 'halfable,' but very much to the contrary. So he says, 'You door-skulker, what do you want there?' And I see that he got his hot leg up, certain to fly to bad language. According, I asked, with my breath in my hand, if he pleased to see any young man there just now, by reason that such likes had been observated going out in some direction. But his lordship roared to me to go in another direction, not fit for young ladies. My old lord was up to every word of English; but his present lordship is the hoppersite extreme."

"Is that all you have to tell me, Stixon? Did you never see that fearful man again? Did you never even hear of him?"

"Never, miss, never! And to nobody but you have I ever told all as I told now. But you seems to be born to hear it all."

CHAPTER XXXVIII.

A WITCH.

It was true enough that Stixon now had nothing more to tell, but what he had told already seemed of very great importance, confirming strongly, as it did, the description given me by Jacob Rigg. And even the but-

ler's concluding words—that I seemed born to hear it all—comforted me like some good omen, and cheered me forward to make them true. Not that I could, in my sad and dangerous enterprise, always be confident. Some little spirit I must have had, and some resolve to be faithful, according to the power of a very common mind, admiring but never claiming courage. For I never did feel in any kind of way any gift of inspiration, or even the fitness of a quick, strong mind for working out deeds of justice. There were many good ladies in America then, and now there are some in England, perceiving so clearly their own superiority as to run about largely proclaiming it. How often I longed to be a little more like these, equal to men in achievements of the body, and very far beyond them in questions of the mind!

However, it was useless to regret my lacks, and foolish, perhaps, to think of them. To do my very best with what little gifts I had was more to the purpose and more sensible. Taking in lonely perplexity now this dim yet exciting view of things, I resolved, right or wrong, to abide at the place where the only chance was of pursuing my search. I was pledged, as perhaps has been said before, to keep from every one excepting faithful Betsy, and above all from Lord Castlewood, the unexpected little tale wrung out of Mr. Stixon. That promise had been given without any thought, in my eagerness to hear every thing, and probably some people would have thought of it no more. But the trusty butler was so scared when I asked him to release me from it, so penitent also at his own indiscretion, which never would have overcome him (as he said in the morning) only for the thunder-storm, that instead of getting off, I was quite obliged to renew and confirm my assurances.

Therefore, in truth, I had no chance left but to go back to Shoxford and do my best, meeting all dark perils with the shield of right spread over me. And a great thing now in my favor was to feel some confidence again in the guidance of kind Wisdom. The sense of this never had abandoned me so much as to make me miserable about it; but still I had never tried to shelter under it, and stay there faithfully, as the best of people do. And even now I was not brought to such a happy attitude, although delivered by these little gleams of light from the dark void of fatalism, into which so many bitter blows had once been driving me.

However, before setting off again, I made one more attempt upon Lord Castlewood, longing to know whether his suspicions would help me at all to identify the figure which had frightened both the sexton and the butler. That the person was one and the same, I did not for a moment call in question, any more than I doubted that he was the man upon whose head rested the

blood of us. But why he should be allowed to go scot-free while another bore his brand, and many others died for him, and why all my most just and righteous efforts to discover him should receive, if not discouragement, at any rate most lukewarm aid—these and several other questions were as dark as ever.

"You must not return to Shoxford, my cousin," Lord Castlewood said to me that day, after a plain though courteous refusal to enlighten me even with a mere surmise, except upon the condition before rejected. "I can not allow you to be there without strict supervision and protection. You will not, perhaps, be aware of it, as perhaps you have not been before; but a careful watch will be kept on you. I merely tell you this that you may not make mistakes, and confound friendly vigilance with the spying of an enemy. Erema, you will be looked after."

I could not help being grateful for his kindness, and really, try as I might to be fearless, it would be a great comfort to have some one to protect me. On the other hand, how would this bear upon my own freedom of looking about, my desire to make my own occasions, and the need of going every where? Could these be kept to my liking at all while an unknown power lay in kind regard of me? Considering these things, I begged my cousin to leave me to my own devices, for that I was afraid of nobody on earth while only seeking justice, and that England must be worse than the worst parts of America if any harm to me could be apprehended at quiet times and in such a quiet place.

My cousin said no more upon that point, though I felt that he was not in any way convinced; but he told me that he thought I should pay a little visit, if only for a day, such as I treated him with, to my good friends at Bruntsea, before I returned to Shoxford. There was no one now at Bruntsea whom I might not wish to meet, as he knew by a trifling accident; and after all the kind services rendered by Major and Mrs. Hockin, it was hardly right to let them begin to feel themselves neglected. Now the very same thing had occurred to me, and I was going to propose it; and many things which I found it hard to do without were left in my little chest of locked-up drawers there. But of that, to my knowledge, I scarcely thought twice; whereas I longed to see and have a talk with dear "Aunt Mary." Now, since my affairs had been growing so strange, and Lord Castlewood had come forward—not strongly, but still quite enough to speak of—there had been a kind-hearted and genuine wish at Bruntsea to recover me. And this desire had unreasonably grown while starved with disappointment. The less they heard of me, the

more they imagined in their rich good-will, and the surer they became that, after all, there was something in my ideas.

But how could I know this, without any letters from them, since letters were a luxury forbidden me at Shoxford? I knew it through one of the simplest and commonest of all nature's arrangements. Stixon's boy, as every body called him (though he must have been close upon five-and-twenty, and carried a cane out of sight of the windows), being so considered, and treated boyishly by the maids of Castlewood, asserted his dignity, and rose above his value as much as he had lain below it, by showing that he owned a tender heart, and them that did not despise it. For he chanced to be walking with his cane upon the beach (the very morning after he first went to Bruntsea, too late for any train back again), and casting glances of interior wonder over the unaccustomed sea—when from the sea itself out-leaped a wondrous rosy deity.

"You there, Mr. Stixon! Oh my! How long?" exclaimed Mrs. Hockin's new parlor-maid, ready to drop, though in full print now, on the landward steps of the bathing-machine set up by the reckless Major.

"Come this very hinstant, miss, honor bright!" replied the junior Stixon, who had moved in good society; "and just in the hackmy of time, miss, if I may offer you my 'umble hand."

The fair nymph fixed him with a penetrating gaze through tresses full of salt curliness, while her cheeks were conscious of an unclad dip. But William Stixon's eyes were firm with pure truth, gently toning into shy reproach and tenderness. He had met her at supper last night, and done his best; but (as he said to the Castlewood maids) it was only feeling then, whereas now it was emotion.

"Then you are a gentleman!" Polly Hopkins cried; "and indeed, Mr. Stixon, these are slippery things." She was speaking of the steps, as she came down them, and they had no hand-rails; and the young man felt himself to be no more Stixon's boy, but a gentleman under sweet refining pressure.

From that hour forth it was pronounced, and they left the world to its own opinion, that they were keeping company; and although they were sixty miles apart by air, and eighty-two by railway, at every post their hearts were one, with considerable benefit to the United Kingdom's revenue. Also they met by the sad sea waves, when the bathing-machines had been hauled up—for the Major now had three of them—as often as Stixon senior smiled—which he did whenever he was not put out—on the by-gone ways of these children. For Polly Hopkins had a hundred pounds, as well as being the only child of the man who kept the only shop for pickled pork in Bruntsea.

And my Mr. Stixon could always contrive to get orders from his lordship to send the boy away, with his carriage paid, when his health demanded bathing. Hence it is manifest that the deeds and thoughts of Bruntsea House, otherwise called "Bruntlands," were known quite as well, and discussed even better—because dispassionately—at Castlewood than and as they were at home.

Now I won forever the heart of Stixon's boy, and that of Polly Hopkins, by recoiling with horror from the thought of going to Bruntsea unattended. After all my solitary journeys, this might have been called hypocrisy, if it had been inconvenient; but coming as it did, it was pronounced, by all who desired either news or love, to be another proof of the goodness of my heart.

Escorted thus by William Stixon (armed with a brilliant cane bought for this occasion), and knowing that Sir Montague Hockin was not there, I arrived at Bruntlands in the afternoon, and received a kindly welcome from my dear friend Mrs. Hockin. Her husband was from home, and she grieved to say that now he was generally doing this; but nobody else could have any idea what his avocations were! Then she paid me some compliments on my appearance—a thing that I never thought of, except when I came to a question of likeness, or chanced to be thinking of things, coming up as they will, at a looking-glass.

That the Major was out was a truth established in my mind some time ago; because I had seen him, as our fly crawled by, expressly and emphatically at work on a rampart of his own designing. The work was quite new to me, but not so his figure. Though I could not see people three miles off, as Firm Gundry was said to do, I had pretty clear sight, and could not mistake the Major within a furlong. And there he was, going about in a row of square notches against the sea-line, with his coat off, and brandishing some tool, vehemently carrying on to spirits less active than his own. I burned with desire to go and join him, for I love to see activity; but Mrs. Hockin thought that I had better stay away, because it was impossible to get on there without language too strong for young ladies.

This closed the question, and I stopped with her, and found the best comfort that I ever could have dreamed of. "Aunt Mary" was so steadfast, and so built up with, or rather built of, the very faith itself, that to talk with her was as good as reading the noblest chapter of the Bible. She put by all possibility of doubt as to the modern interference of the Lord, with such a sweet pity and the seasoned smile of age, and so much feeling (which would have been contempt if she had not been softened by her own escapes), that really I, who had come expecting to set her beautiful white hair

on end, became like a little child put into the corner, but too young yet for any other punishment at school, except to be looked at. Nevertheless, though I did look small, it made me all the happier. I seemed to become less an individual, and more a member of a large kind race under paternal management. From a practical point of view this may have been amiss, but it helped to support me afterward. And before I began to get weary or rebel against her gentle teaching, in came her husband; and she stopped at once, because he had never any time for it.

"My geological hammer!" cried the Major, being in a rush as usual. "Oh, Miss Castlewood! I did not see you. Pardon me! It is the want of practice only; so wholly have you deserted us. Fallen into better hands, of course. Well, how are you? But I need not ask. If ever there was a young lady who looked well—don't tell me of troubles, or worries, or nerves—I put up my glasses, and simply say, 'Pretty young ladies are above all pity!' My hammer, dear Mary; my hammer I must have. The geological one, you know; we have come on a bit of old Roman work; the bricklayer's hammers go flat, like lead. I have just one minute and a half to spare. What fine fellows those Romans were! I will build like a Roman. See to every bit of it myself, Erema. No contractor's jobs for me. Mary, you know where to find it."

"Well, dear, I think that you had it last, to get the bung out of the beer barrel, when the stool broke down in the corner, you know, because you would—"

"Never mind about that. The drayman made a fool of himself. I proceeded upon true principles. That fellow knew nothing of leverage."

"Well, dear, of course you understand it best. But he told cook that it was quite a mercy that you got off without a broken leg; and compared with that, two gallons of spilled ale—" Mrs. Hockin made off, without finishing her sentence.

"What a woman she is!" cried the Major; "she takes such a lofty view of things, and she can always find my tools. Erema, after dinner I must have a talk with you. There is something going on here—on my manor—which I can not at all get a clew to, except by connecting you with it, the Lord knows how. Of course you have nothing to do with it; but still my life has been so free from mystery that, that—you know what I mean—"

"That you naturally think I must be at the bottom of every thing mysterious. Now is there any thing dark about me? Do I not labor to get at the light? Have I kept from your knowledge any single thing? But you never cared to go into them."

"It is hardly fair of you to say that. The

fact is that you, of your own accord, have chosen other counselors. Have you heard any more of your late guardian, Mr. Shovelin? I suppose that his executor, or some one appointed by him, is now your legal guardian."

"I have not even asked what the law is," I replied. "Lord Castlewood is my proper guardian, according to all common-sense, and I mean to have him so. He has inquired through his solicitors as to Mr. Shovelin, and I am quite free there. My father's will is quite good, they say; but it never has been proved, and none of them care to do it. My cousin thinks that I could compel them to prove it, or to renounce in proper form; but Mr. Shovelin's sons are not nice people—as different from him as night from day, careless and wild and dashing."

"Then do you mean to do nothing about it? What a time she is finding that hammer!"

"I leave it entirely to my cousin, and he is waiting for legal advice. I wish to have the will, of course, for the sake of my dear father; but with or without any will, my mother's little property comes to me. And if my dear father had nothing to leave, why should we run up a great lawyer's bill?"

"To be sure not! I see. That makes all the difference. I admire your common-sense," said the Major—"but there! Come and look, and just exercise it here. There is that very strange woman again, just at the end of my new road. She stands quite still, and then stares about, sometimes for an hour together. Nobody knows who she is, or why she came. She has taken a tumble-down house on my manor, from a wretch of a fellow who denies my title; and what she lives on is more than any one can tell, for she never spends sixpence in Bruntsea. Some think that she walks in the dark to Newport, and gets all her food at some ship stores there. And one of our fishermen vows that he met her walking on the sea, as he rowed home one night, and she had a long red bag on her shoulder. She is a witch, that is certain; for she won't answer me, however politely I accost her. But the oddest thing of all is the name she gave to the fellow she took the house from. What do you think she called herself? Of all things in the world—'Mrs. Castlewood!' I congratulate you on your relative."

"How very strange!" I answered. "Oh, now I see why you connect me with it; and I beg your pardon for having been vexed. But let me go and see her. Oh, may I go at once, if you please, and speak to her?"

"The very thing I wish—if you are not afraid. I will come with you, when I get my hammer. Oh, here it is! Mary, how clever you are! Now look out of the window, and you shall see Erema make up to her grandmamma."

AUF WIEDERSEHN.

"JANET, you ought to have a story written about you. You look so like one."

Janet was walking up the broad oaken stairs in front of me as I made this remark. She turned, laughing in her low sweet way, and leaned against the wall, a slight figure clad all in soft dark blue, from whose dusky lights looked out, more flower-like than ever, the pure face, with its dead-leaf hair and hazel eyes.

"Ought I? Then you tell it for me, Sylvie."

"Ah, my infant, all in good time," I answered. "I must find my, or rather *your*, Prince Charming first; for what's a story, real or fictitious, without a hero?"

"You might manufacture one out of your brain, since I am so devoid of lovers. Couldn't you 'evolve one from your inner consciousness,' as Hillyer says?"

"My dear, impossible. It's a strange and sad fact that since I've promised to take Hillyer and try him for better or worse, the divine afflatus has left me. Does the little god chase out the muse, I wonder?"

"You are very unkind, Sylvie. When I look like a story for one brief half hour of my life, you refuse to utilize me or immortalize yourself by grasping the auspicious time. I shall be a picture no longer."

And so we two happy, careless girls ran up the stairs, bright with the last rays of a May sun that streamed in through the painted window on the landing. We were keeping house by ourselves for a week or two while mamma was visiting in Boston, I, as a recently acknowledged engaged girl, being considered a sufficient chaperon for my pretty friend, Janet Berne.

The little drawing-room lay half in gloom as we entered it: through the open windows the spring air wafted in a sense of magnolia bloom; to the west, above the house opposite, the sun was sinking in the midst of pale pink and primrose clouds; an organ in the street beneath was grinding out brokenly the fact of there being "Silver Threads among the Gold;" a light laugh or half-caught scrap of song came in now and then, thrown out on the gentle air from the overbubbling of some joyous heart.

The half-light, the keen scent of the little pine fire that it was Janet's fancy to keep lighted on the hearth through all seasons, because it was so companionable, the odor of the coffee ready served for us in dainty *faience* cups, the slow wafting to and fro of the light draperies at the windows, stand out to me now as vividly from the fair days that are dead as they did then when that was present and this future.

Janet seated herself on the low window-seat, the primrose sky making a fine setting for her little head. I, in the easiest of

lounging chairs, sipped my coffee and wondered when my lover would appear.

"Some one ought to come in now, Janet—some one that you have not seen for years—and be captivated, fascinated, by your pretty face in the gloaming," said I, still harping on the old subject; for one of my characteristics is the tenacity with which I cling to an idea or argument, and ring out the changes thereon unceasingly.

Janet laughed. "And who should come, since I have known no one that has gone away, except one, and he can never come back this side the grave."

"Janet, you have had a story, and never told it me!" I said, severely. "Is this fair or just, I ask, since from the very smallest beginning of Hillyer's and my romance you have known all?"

"It's such a morsel of a story," she said, apologetically; "and it scarcely had any real beginning, and can never have any ending."

"Then it must be all middle; and as beginnings and endings are the meanest of all things, it must be all nice. Let me hear it, Janet, at once."

So, sitting with her back to the pale light, her pretty figure half shaded by the muslin curtains, my little Janet told her summer story.

"You remember, dear, last spring, during the Franco-German war, I went abroad with George and Dora. Well, it all happened then. We were quite a large party, for besides our number of three, there were Maggie and Edith Griffith, and their two brothers, Jack and Frank.

"We were to spend the summer abroad, wandering wherever we liked, dawdling a day here and a day there, altering our plans as soon as we made them, each having our own pet route, and each arguing with the other concerning it, and all of us combining to drive George, our supposed captain, distracted with our squabbling; but it was all good-natured squabbling, and we got a good bit of fun out of it.

"I am sure you know, too, that at that time Jack chose to consider himself engaged to me, and I, *faute de mieux*, and because he was such a dear, jolly boy, with the kindest heart in the world, let him keep on thinking so.

"We went through England, posting as much as we could, stopping at all the cathedral towns or villages that had pretty names and prettier bits of scenery. In this way we reached London one fine warm June evening. We had taken the coach from Virginia Water to please me, who had never before beheld one, and to whom it seemed untold bliss to occupy the box seat. I shall never forget that delicious drive. June evenings are lovely any where, but above all so in England, where every road-side is

crowded with sweet wild flowers, and every stone wall has back of it a carpet of freshest green shadowed by darker foliage, through which one catches glimpses of Elizabethan or Gothic homesteads.

"Through the soft warm air we drove, and gradually London loomed upon us, picturesque in its glory of old, old time, and bright in the golden sunlight.

"The guard blew his horn, our noble coachman assumed, if possible, a still more careless and indifferent air, and we rattled down Piccadilly up to the White Horse Cellar; then we all scrambled down, and Jack tipped the guard and our noble coachman, whose face, by-the-way, remained perfectly stolid, but whose eyes could not help darting a little impudent look into my laughing ones. You see, I remember every detail of that evening. Indeed, they have come back to me often enough since then.

"We had to make all haste to our hotel, as Dora, George, Jack, and I were to dine with a certain Mrs. Lancaster, a lady who prided herself on her artistic taste and her artistic reunions, and who lived in a most charming house in Portman Square, which to be once seen was to be forever remembered.

"We were to dine at half past seven. A soft musical chime was just striking the half as we entered the low long withdrawing-room; it was unlighted, save for the dancing flames of a wood fire and the fast-dying twilight that came still more subdued through the colored windows.

"Our hostess met us most cordially, presented us to the two or three nearest us, and then, as we were the last to arrive, and our entrance was almost simultaneous with the announcement of dinner, we prepared to walk in. I was just wondering which of the seven black-coated, white-tied, yellow-haired fraternity would fall to my lot, and wishing with all my soul that I might go in with Jack, when Mrs. Lancaster touched my shoulder with her fan, and said,

"Allow me, my dear, to present your cavalier—Lord Southwell, Miss Berne."

"I bowed my acknowledgments, and then looked at him. Behold, Sylvie, my dear, it was our noble coachman of the Virginia Water coach!"

"So this is your beginning," said I—"a lord, *par exemple*!"

"It's not my beginning at all," says Janet, "but only the *avant-scène*."

"What, another victim still? Oh, Janet, Janet!"

"You shall hear nothing more at all if you don't stop. Lord Southwell was not a victim."

"Go on, then, dear, I was only joking; do let us get on to the middle before Hillyer comes. What did your lord do or say upon meeting you again?"

"He said nothing; I don't think he re-

membered me; but I thought of Jack's tip, and wondered if with it he had purchased the bit of stephanotis that reposed on the left breast of his coat. By this time we were at table, and I began to feel quite at ease. My left-hand neighbor was a young man of pre-Raphaelite tendencies, a nephew of Mrs. Lancaster, who divided his time pretty equally between his plate and a fair, red-haired girl in a violet gown, whose picture he once painted, Lord Southwell told me, as 'The Blessed Damozel,' and in so doing had fallen in love with her, and was now sighing to make her his wife, in order, as he told Jack, to always have the charm of perfect coloring before his eyes.

"Did he imagine, I wondered, that she would walk through life always arrayed in a purple gown?"

"After the soup and the fish, my lord made the remark,

"'I think you are a stranger here, Miss Berne?'

"'Yes—an American.'

"'Indeed!' with a look of astonishment. 'But you have often been in London, I should fancy.'

"'I came in to-day, for the first time, on the box seat of the Virginia Water coach,' I answered, demurely.

"'Impossible, Miss Berne. Why, then, by Jove, I must have driven you.'

"'I think you did,' said I. 'And don't you remember Jack there giving you a tip, and my laughing out loud when he did? It was at the thought of what our men would say to such a thing in America.'

Now I who am telling this bit out of a life must bid you here remember that it all occurred before the advent of Mr. Kane with his Pelham coach.

"'Of course I remember now,' he said. 'Your eyes ought to have told me before. But then, you know, who ever thought of meeting you here?'

"After that we got on splendidly, and by the end of dinner I felt quite at home with Lord Southwell, and had in my mind several pleasure trips he had proposed for my benefit. We all left the table together, and floated in *en masse* to the brilliantly lighted drawing-rooms. These began to fill rapidly with Mrs. Lancaster's expected guests, and I soon found myself alone at one end of the room, separated from the music parlor only by half-drawn *portières*. Some one within there was touching the piano softly, a few low chords, and then over the quickly hushed crowd, in a man's rich barytone, rang the words of Liebe's 'Auf Wiedersehn.' Sylvie, I will never, never forget that song. It sounded in my ears all night long. 'Auf Wiedersehn, Auf Wiedersehn,' I kept repeating over and over.

"The last words were sung, and the hum of conversation recommenced, and closed

over the music, drowning it in many hearts, but not in mine. It never could be wiped out of my memory—no, never.

"A voice, Lord Southwell's, half hesitating, half apologetical, brought me back to the fact that I was in London, at an everyday reunion, and that it behooved me to act like the ordinary nineteenth-century young woman, not like a music-struck maiden.

"'Miss Berne,' the voice was saying, 'may I present my friend Bertram Fitzgerald?'

"I raised my eyes, and beheld the very handsomest man I have ever seen in my life.

"Sylvie, to my shame be it said, I fell in love with him on the spot. He was tall and straight-limbed, with the head and throat of an Apollo; crisp rings of sunny brown hair covered his head, and his eyes were the palest brown, growing yellow toward the pupil; a firm straight mouth, with only the shadowing of a pale brown mustache, and coloring warm and soft as an Italian's.

"This, I knew at once, was the man who had already half sung my heart away, and now the other half was won by his beauty.

"I looked at him very quietly. 'You have been singing "Auf Wiedersehn," let me thank you.' I put out my hand; he took it as gravely as I gave it.

"After that evening he was with us all the time. We were very gay. We went every where—to garden parties, to flower shows, to dinners, to the opera, to the theatre, to Richmond, to Bushy Park, Windsor—every where where pleasure could be found, and at all places he was at my side. Of course I learned all about him. He was a roundabout cousin to Lord Southwell, an orphan, half French, half Irish, very poor, and very proud. He had been educated abroad as a surgeon, taken some degrees, and was already well spoken of in the surgical and medical world in London.

"Six weeks passed in this way; and you know in six weeks one can learn a great deal. I learned that the world held but one man for me, and that one was Bertram Fitzgerald.

"One morning Lord Southwell came in, and proposed a long day at his little box in the country, on the banks of the Thames.

"We were to drive down on his drag, lunch, row to Richmond, dine there, and then drive up to town by moonlight. Of course we all wanted to go—all but Jack, who made some excuse; so we left without him.

"It was a very perfect day. We drove through sweetest country roads, with bits of river shimmering between the trees, to Shepperton, and there we found the dearest cottage home, half smothered in roses without and steeped in luxury within. After luncheon we strayed about as each best liked. Naturally enough, it was Fitzgerald

and I that found ourselves at the bottom of the old fruit garden, rich in all manner of cherry, apple, and peach trees.

"Let us sit down here," I said, "just under this tree. We have such a pretty picture either way—behind us, Lord Southwell's ideal cot; before us, the slowly rippling water of your quiet river."

"So we did; and so well had we come to know each other that it was nothing strange our sitting without words of any kind passing between us.

"The little boats sped by us on the river, now pulled by some fresh young girl, now by some Cambridge or Oxford student getting up in his stroke against next Easter-time.

"Sing me something," I said at last. "Sing me 'Auf Wiedersehn.'"

"Without a word he obeyed me. It was the same song, the same voice, that first won me. When he finished, I said, half dreamily,

"Auf Wiedersehn! Will that be for either of us ever, do you think?"

"A month, even a week, ago," he answered, "I should have said nothing more likely; but now—no—I don't think we will find out the truth of the song ever in this world."

"I looked up at his handsome face, and tried to think what life would be like without him; my old life—the life at home—seemed so far distant, and this was so near, so good. I think, Sylvie, there must have been some piteous question or appeal in my eyes, for, as he looked down upon me, his whole face changed, and suddenly taking me in his arms, he kissed me over and over.

"These," he said, in a half-whisper—"these are for love and for good-by! Janet, Janet, why are you not free for me to have as my very own? Forgive me; I have shocked you. I know you must despise me. I know all your kindness, all your gentleness, to me, these long, delicious days, have meant nothing but friendship. I knew of your engagement to Jack almost before I knew you. There can be no excuse for me in your eyes. I know I must seem dishonorable, cowardly; but oh, Janet, forgive me! I shall never see you any more, and I love you, my little Janet!"

"What did you say?" I asked, prosaically, as Janet halted in her story.

"What could I say, Sylvie? I was bound to Jack, and, much as I might want to, decency forbade my calling Bertram back and telling him I would gladly throw Jack over for his sake."

"So he went away?"

"Yes, he went away, and the rest of the day is a maze to my memory. Of course we dined at Richmond, and of course we drove home as we had planned, and it was a very gay and merry party; but I can remember nothing distinctly, save the persistent way

in which one line of his song would go over and over in my brain,

'Auf meinen bleichen Mund
Den letzten Kuss.'

"The next day was the last of our stay in London; people were in and out all day to say good-by. For afternoon tea came Lord Southwell. After a little talk, I heard him say to Dora,

"A strange fancy, this of Fitzgerald, to go off and give the Germans a chance to pop at him. What, didn't you know? Oh yes, he left in the tidal train this morning to take part charge of a French ambulance. After all, he's half French, you know, through his mother; so it's only natural; but I do hope none of those beastly Germans will make a target of him. He's a nice old boy, is Fitzzy; we'll all miss him horridly."

"I didn't scream and I didn't faint, Sylvie, and I did laugh and talk and say good-by to them all brightly; but something went out of my life then that has never come back to it since.

"We came home, you know, almost immediately, without visiting the Continent. On the steamer I told Jack all about it, and asked him to free me from my engagement. Like the perfect gentleman he is, he did so, kindly and without blaming me, though I know it went hard with him for a time. Now he is all over it, and has the sweetest wife in all the world, as we know.

"Shortly after our arrival home I saw in an English *Times* a brief notice of the sad, early death of Bertram Fitzgerald, shot down by a cowardly German when he was helping a wounded Frenchman.

"That is my story, Sylvie, without beginning and without end; judge for yourself if the middle is all nice."

I did not answer her. As she sat in the quick-coming darkness, I could just see the faint outline of her face buried in her hands, while I felt rather than saw the tears that were falling.

A hand was laid on my shoulder, a warning finger on my lips. I caught sight of Hillyer and Jack, and then felt myself being carried off bodily into the small room back of the second drawing-room. There were bright lights here, and standing by the piano, his hands resting on the keys, I beheld "the very handsomest man I have ever seen in my life."

I gave a little mute sign of delight, seized Hillyer's hand in mine, and pressing it hard, laughed and cried together.

Very softly he at the piano touched the chords; then, in such a wooing, tender voice, he sang,

"Weil es sein Leid vergisst,
Weil du mein eigen bist,
Weil du mich innig drückest
An deine Brust,
Auf Wiedersehn."

Down the now dark drawing-room, as one half dreaming, came my Janet. She stood, one moment only, within the dark draperies at the door, a wistful look on her fair, sweet face; then, "Bertram!" she cried, and fled to his open arms, lost to all sense of those about her in the fullness of her love.

And this is the story of my little Janet. Her lover was not killed, and he was true to her. From Lord Southwell he heard of her broken engagement, and so came over the sea to seek her, and thus seeking, met Hillyer and Jack, and they both being young and both romantic, made the meeting what it was.

My little Janet is very happy in her English home. Lord Southwell has stood for her first boy, who, as his godfather remains unmarried, bids fair in time to become an heir to wealth and distinction.

Janet has beneath her own and Bertram's name on her wedding ring the two words so full of meaning to her,

"AUF WIEDERSEHN."

OUR CIVIL SERVICE.

THE following facts and considerations on the subject of our civil service are addressed especially to the voters, because it is only upon the people, moving in their primary assemblies, conventions, and at the polls, that we can rely permanently to remedy an evil which has become of great magnitude, seriously deteriorating and polluting the civil service in all its branches. Years of experience in public service, both at home and abroad, may enable me to contribute something of interest concerning the working of our civil service, and I shall endeavor to show as briefly as possible what kind of civil service the framers of the Constitution and the fathers of the republic thought they had established; how they administered it in actual practice for forty years; how the vicious "spoils system" was introduced; its evil effects; and the remedy.

No matter what parties have said and have put in their platforms, experience teaches us that such periodical announcements are but hollow pretenses of virtues to which their acts as party politicians prove they have no just claim. If the people wish to see a great public evil rooted out of our political system, they must undertake the work.

It is sometimes the case that a public evil of a malignant character, and even of great magnitude, must run its course and clearly show its worst form before public attention is sufficiently arrested to induce the people to demand efficient remedies. Our civil service long since reached this stage in its downward course. The principle upon which it has been administered since the introduction of the "spoils sys-

tem," and the results produced, are all so pernicious and so destructive of competent, responsible, and honest government that the people, finally alive to the peril, are raising a loud and general cry for radical reform in this branch of their government. This call comes from all parties, and is so imperious that the national conventions of both Democrats and Republicans for the nomination of Presidential candidates were obliged to listen to it, and to embrace civil service reform in their platforms, although this reform was directly contrary to the practice of both.

In obedience to this demand, there now seems to be some prospect that, for a time at least, our public men will be obliged to acknowledge and act upon the fact that offices were created and officers appointed for the public good, for the benefit of the whole people irrespective of party, and not merely for the use and advantage of one party, or of a President and his friends, as though the offices and patronage of the government belonged to them, and had by conquest become, as it were, a part of their personal estate, to be used for their own exclusive benefit without regard to the public weal or the efficiency and faithfulness of the service. Though a President and a majority in Congress may be chosen by a party, they should be kept firmly to the great truth that they are the holders of power not merely for a party, but in solemn trust for the whole people of the country; that it is a sacred trust committed to their keeping only for a time, and that they swear to preserve this trust and transmit it to other hands unimpaired.

The mode of appointing public officers was felt by the framers of the Constitution to be a question of very great and grave importance. Though the country was then small in territory and population in comparison with what it has since become, and the officers to be appointed were few in number, it was fully realized that the power over appointments to office and the power to control the public patronage of the nation was too vast and too imperial in its nature to be intrusted to one man. This was a question to which the members of the Constitutional Convention gave much attention. Different modes of appointment were presented and exhaustively discussed, and, after the most mature deliberation, the Convention unanimously adopted the form of appointment as it now stands in the Constitution. That portion of the article bearing upon the subject under consideration is as follows:

"He [the President] shall nominate, and by and with the advice and consent of the Senate shall appoint, ambassadors, other public ministers and consuls, judges of the Supreme Court, and all other officers of the United States whose appointments are not herein otherwise provided for, and which shall be established by law; but the Congress may by law vest the appoint-

ment of such inferior officers as they think proper in the President alone, in the courts of law, or in the heads of departments. The President shall have power to fill up all vacancies that may happen during the recess of the Senate, by granting commissions which shall expire at the end of their next session."

It is here made the duty of the President to nominate, and, after the *advice and consent* of the Senate have been given and the nomination confirmed, to complete the appointment by commissioning the officer. The Constitution gives the President no absolute power over appointments, excepting over such inferior offices, if any, as Congress may deem it safe and wise to vest in him. It is made his duty to select suitable candidates for office, and to nominate them to the Senate for confirmation.

If the Presidential nominees are not thought by the Senate to be suitable persons for appointment to the positions for which they were nominated, then it is its duty to withhold its "advice and consent" to such unfit and improper nominations. This joint action of the President and Senate in making appointments divides the responsibility between them, and makes the Senate responsible as well as the Executive for bad or for merely political appointments.

Such being the appointing power under the Constitution, where rests the power of removal from office?

The Constitution is silent upon a subject which to a greater extent than any other single question involves the honesty, purity, and respectability of our government, and possibly its durability in the form intended by the wisdom which put it in operation. This interference with the rights of judgment and conscience, by the tremendous power of removal on political grounds alone and the control of the greatest patronage wielded by the head of any civilized state, does not legitimately grow out of and can not be derived from the simple power to nominate persons for office.

Without any action of Congress vesting the power of removal elsewhere than in the appointing power, the authority to remove an officer must remain with that power, viz., the President and Senate conjointly, and not the President alone. It is certainly more than doubtful whether Congress has the constitutional right to give a President the unrestricted power of removal. We shall see that the first Congress which met under the Constitution did not claim such a power, but repudiated it. The President is authorized to fill any vacancy that "*may happen during the recess of the Senate*;" but such appointees can hold office no longer than the end of the next session of the Senate, unless confirmed by that body. The President has no right to *create* vacancies by removals for the sake of filling them with his friends. He can for a short time fill

such vacancies as "*may happen*" by death, resignation, or otherwise, but vacancies do not *happen* when made by the act of removing one officer that his place may be given to another. Nor does a nomination merely, without confirmation, create a removal.

After the Constitutional Convention completed its work in 1787, and sent the Constitution out for the approval of the people through their State Legislatures or Conventions, many of the patriots of that day, jealous of every thing like a tendency to monarchical power, thought they saw, at some future time, danger in this provision for appointments to office. They objected to its want of clearness and precision, and feared that in the future an unscrupulous and partisan Executive might, through a too confiding Congress, or through one more devoted to the supremacy of party than to the interests of the country, get control of this despotic power of removal, and use it for the purpose of strengthening and aggrandizing himself and his friends and party, without regard to the interests of the whole country. To allay these just fears and reconcile the people to the adoption of the Constitution as submitted to them, the provision in regard to appointments to office was so construed and explained by the public men of that day as to require the concurrence of the Senate to remove an officer whose nomination they had already confirmed. If there were any opposition to this construction anterior to the adoption of the Constitution and while it was before the people for approval, there is no evidence that such opposition any where showed itself. While no statesman or prominent man of that day had the courage, or perhaps the desire, to contend for the construction since acquiesced in, abundant argument was made to satisfy the people that it required the same power to remove an officer as to appoint him, and that there was, therefore, no danger that the President, in our republican government, would ever be allowed the sole power of controlling appointments and dispensing patronage.

The *Federalist* was at that day, and in part has ever since been, the great authority and accepted expounder of the several provisions of the Constitution. It was written by Hamilton, Madison, and Jay, and was published in numbers in all the newspapers of the time, for the purpose of clearly and fully explaining the Constitution to the people of the States, by whom it was to be accepted before becoming the fundamental law of the land.

The following extract is from No. 77 of this work, and was written by Alexander Hamilton, one of the most able and conservative of all the Revolutionary statesmen, in explanation of the clause relating to appointments:

"The consent of that body [the Senate] would be necessary to displace as well as to appoint. A change of the Chief Magistrate, therefore, could not occasion so violent or so general a revolution in the offices of the government as might be if he were the sole disposer of offices. Where a man in any station had given satisfactory evidence of his fitness for it, a new President would be restrained from attempting a change in favor of a person more agreeable to him, by the apprehension that a discountenance of the Senate might frustrate the attempt and bring some degree of discredit upon himself. Those who can best estimate the value of a steady administration will be most disposed to prize a provision which connects the official existence of public men with the approbation or disapprobation of that body [the Senate], which, from the greater permanency of its own composition, will in all probability be less subject to inconstancy than any other member of the government."

Such was the construction put upon this article of the Constitution by the men who framed it, and by the public men who were contemporaneous with its birth, its adoption, and the formation of our republican government under it. So clear an understanding of a whole people without division in a matter of such magnitude, and in which they had so great an interest, ought forever to have settled the question of Executive power over removals from office, especially for political reasons only.

The early departure from a principle so nearly unanimously assented to, and which seemed to be so well established, appears to the student of civil polity of our time one of the most singular anomalies in our political history; but it shows the strong faith cherished by the men of that early day in the continued watchfulness of the people over the affairs of government, as well as in the patriotism and justice of the men whom they might elevate to the Presidential chair.

Such was the first stage in the attempt to provide for the power of removal under the Constitution.

We have seen, so far as has been made known, in what light the men who framed the Constitution, and the people of the several States that adopted it, regarded the provision in relation to the power of appointment to and removal from office. The Constitution was under discussion in State Legislatures and Conventions and by the people from 1787 to 1789, when it was adopted by all the States—excepting Rhode Island, which soon joined—and went into operation by the election of Washington as President, the election of members of Congress, and the organization of a government.

Up to that time it does not appear that the opinion was any where entertained that the people had voted to place the tenure of the civil officers of the country at the unrestricted will and pleasure of one man. The men of that day little dreamed that in the power of appointment, or elsewhere in the Constitution, there lay concealed that vast and mischievous power which has since

been forced from it by politicians for purely partisan purposes, thus overturning and putting aside their expressed will and desire upon the subject.

Upon the assembling of Congress, and the putting into operation the several executive departments of the government, bills were introduced to organize the departments of State, Treasury, and War. Then arose the very serious question as to where, except by impeachment, should rest the rightful authority to remove public officers for justifiable cause. I say justifiable, for no one then pretended that an officer could be removed for political reasons, or for any reason but incompetency or misconduct. It took forty years to reach that stage of political decline, and to act upon the principle that offices necessary to carry on the government for the whole people were the exclusive property of the ruling party, to be parceled out among its retainers only. The bill to organize a State Department, as reported from the committee, contained a clause giving the President power to remove the Secretary without the concurrence of the Senate as a responsible part of the appointing power. As there is no word or words in the Constitution giving the President the power of removal, it had to be drawn by inference and forced by legislative construction from some one or more of the powers expressed therein. When the bill came before the House of Representatives in 1789, the question of the power of removal from office was discussed with much warmth and ability for several days.

The admission of such a power in executive hands, even under the rigid restrictions which were then claimed would always govern it, was most strenuously opposed by many of the best and most able men in the House. They stood upon the ground that the Constitution nowhere gave the President authority to remove a public officer; that it required the same power to remove as to appoint, viz., both President and Senate; that the admission by inference of any control, however limited, by the Executive was anti-republican, and would in time degenerate into a control over the freedom of opinion and the political rights of all persons in the civil service, and make them the slaves and tools of an unscrupulous political party. They clearly foreshadowed the "spoils system" and the long train of evils it has brought upon the country.

The advocates of the power could refer to no clause in the Constitution from which it might be directly derived, but relied mainly on the article which required the President to see that the laws are faithfully executed, and on the still broader and bolder declaration that the power of removing officers was but a part of and included in the executive power. They considered it expedient and

necessary that the President should, under certain limitations, have the power to remove officers for cause, to enable him to properly perform his duty as executive head of the government, and they therefore sought to derive it inferentially from some expressed power.

It is highly important to keep in mind that the advocates of executive power of removal did not claim for the President a general, but a narrowly restricted, power. They thought it could not be extended further than to the removal of incompetent or unfaithful officers, or such as were so unfit for the places they occupied as to render their continuance in office incompatible with the public good or the interest of the service. To remove a competent and faithful officer for political, personal, or any reason other than such as the good of the service might require, would be so gross and tyrannical an abuse of power as to render the President himself liable to impeachment and removal for such an unconstitutional act.

Mr. Madison, during the discussion, for the first time, so far as public records show, expressed his opinion on the subject. In reply to members who opposed placing the power, however limited, solely in the hands of the President because they could see no warrant for it in the Constitution, and because they believed it would in time overleap the restrictions set for it, become general in practice, and lead to great abuse and political corruption, he spoke as follows:

"But the power we contend for will not enable him to do this, for if an unworthy man be continued in office by an unworthy President, the House of Representatives can at any time impeach him, and the Senate can remove him whether the President choose or not. The danger consists merely in this, the President can displace from office a man whose merits require that he should be continued in it. What will be the motives which the President can feel for such an abuse of power and the restraints that operate to prevent it? In the first place, he will be *impeachable by this House before the Senate for such an act of maladministration, for I contend that the wanton removal of meritorious officers would subject him to impeachment and removal from his own high trust.*"

Such was the opinion of one of the fathers of the Constitution, and a man who took a conspicuous part in organizing the government under it. With this understanding that the power of removal to be intrusted to the President was limited, and only to be applied to such cases as became necessary to secure a proper performance of official duties, the bill passed the House of Representatives, and was sent to the Senate for concurrence. After a lengthy discussion it passed that body by the casting vote of the Vice-President. Thus, against the judgment and votes of a powerful opposition in both Senate and House, what was understood to be a partial and limited power of removal was given the President by legislative construction of the Constitution. The

advocates of the bill expressly declared that a difference in politics, personal favoritism, or any reason other than for the public good, would afford no excuse for the removal of a meritorious officer, but, on the contrary, the discharge of such an officer by the President on such grounds would be unconstitutional and an impeachable offense, and would render the President himself liable to removal from office. They did not pretend that the power to remove public officers duly appointed was expressly granted to the President, but believing it necessary that he should have it so far as to secure a faithful execution of the laws and official duty, they sought a lodgment for it under the shadow of one or more of the expressed powers, feeling all the time, no doubt, that they were straining the Constitution to find a place upon which to ingraft it.

It is much to be lamented that they did not clearly define by law for what reasons they believed the Constitution permitted the use of the power, and the extent to which they intended it should be applied, instead of contenting themselves with mutual understandings, verbal explanations and declarations upon the subject. As but a limited right of removal for certain specified reasons was claimed, laws should have been passed clearly defining for what causes officers were liable to removal, and regulating the manner in which such removals should be made. Had they endeavored in this way to establish and give permanency to their construction of the Constitution, confining the power of removal within certain prescribed limits, and setting the government in operation with a clearly defined system on the subject, their successors would have been far less liable to depart from it, and the country, even to this day, might not have been cursed with the "spoils system." But Washington was then President, and no doubt his pure and noble character had much influence in leading a majority in both branches of Congress to invest the President with what they supposed was, and should ever remain, a rigidly restricted power of removal. They felt that he would execute the law strictly as they intended it should be executed, in no partisan or political sense, but for the good of the whole people, and that his wise and patriotic example would make safe precedents for his successors to follow. Had the men who passed the law giving this limited power of removal to the President but anticipated to the smallest extent the vast abuse for which their act laid the foundation, and the great demoralizing effect on the government and political character of the nation which followed, it is not probable that a law which was the first step toward placing so boundless and imperial a power in the hands of one man could have obtained a solitary vote in that Con-

gress of patriotic men fresh from the camps and councils of the Revolution.

Some public men, then and since, have endeavored to derive the authority from the article declaring that "the executive power shall be vested in a President of the United States," as though the simple term "executive power" had in itself an understood and conceded meaning, the extent of which was every where the same and applicable alike to all times and all countries. But executive power, like any other power derived from the people, or assumed and exercised without authority from them, has its measure of quantity, and the amount of it vested in the executive head of a nation is only just the amount that the institutions, customs, or laws of the nation give him. He can derive no power from the naked term itself. In despotic governments all power is vested in the emperor, king, chief, or whatever name he may have. In a limited monarchy, especially in one with parliamentary government like that of England, executive power is a very different thing, and has become quite subservient to law and the national will.

In our republic the President has just that amount of executive power which the Constitution and laws made in conformity therewith give him, and no more. Any attempt to enlarge it beyond its prescribed bounds by infolding it in an abstract term, assumed to always express its highest quantity, is inapplicable to the case and too trivial for argument.

The practice of all parties which controlled the government, from Washington to the close of John Quincy Adams's administration, a period of forty years, embracing the administration of six Presidents, was in nearly strict conformity with the limitations given the power of removal by the Congress of 1789. No faithful officer was removed during all this period except for justifiable cause, unless, perhaps, in a few cases it may have been done by Mr. Jefferson, and even he retained as members of his cabinet two or three Federalists who were in that of Mr. Adams, his immediate predecessor.

A few of these removals were said to be for political reasons, and caused great complaint throughout the country. He was accused of overriding the limits set to the power of removal by the Constitution and the Congress of 1789, and therefore disregarding his oath of office. So sensitive were the people of that day in regard to this subject that, upon the suspicion of removals being effected on political grounds, the force of public opinion drove President Jefferson to an explanation and defense of his action. In a letter to Elbridge Gerry, of Massachusetts, he said, "The right of opinion shall suffer no invasion from me. Those who have acted well have nothing

to fear, however they may have differed in opinion from me."

The whole number of removals, from all causes, during the first forty years of the government under our Constitution was but *seventy-four*—an average of less than *two* for each year.

This closes the second period in the history of our subject, and we now enter upon a new era, an era of revolution, when the old and safe doctrines established in wisdom and patriotism were set aside.

This brings us down to the commencement of General Jackson's administration on the 4th of March, 1829, when the doctrine of rewards and punishments for political opinions was, for the first time in our history, made a leading feature in the policy of a powerful political party controlling the government. The sound and safe doctrine in regard to removals established by the first Congress, under the lead of Madison, and practiced by all the early Presidents from Washington down to and including John Quincy Adams, was completely overturned, and a new and pernicious theory put in practice. This new political heresy seems to have become so firmly fastened upon our political system that no party or President, unless President Hayes should prove an exception, has since shown the courage or inclination to resist it. As proclaimed by the dominant party, in the language of the day, the new revelation was, "To the victors belong the spoils."

Notwithstanding the announcement in his inaugural message that "patronage of the government should not be brought in to conflict with the freedom of elections," General Jackson turned his back upon the professions of but a few days before, and upon the long-settled law and practice of the government, and acting upon this "spoils" doctrine, proceeded at once, in the recess of the Senate, to remove competent and faithful officers by the hundred for no cause but a difference in political opinions, and to reward the friends who had been active in securing the election of himself and his partisans by appointments to the places of those removed. This ostracism for opinion's sake extended to every branch of the civil service. Postmasters, custom-house officers of all grades, marshals, district attorneys, auditors, controllers, land and Indian agents, surveyors, clerks in the several departments, and so on, fell by hundreds, victims of political proscription. The persons removed, if not actively in favor of Jackson and his party, could not in many cases have been strong opponents, because many of them held office under Jefferson, Madison, and Monroe, who were of the same political party as himself. John Quincy Adams made but *two* removals during his term of four years, and both were for good and sufficient reason.

Such was the introduction into our political system of the detestable doctrine of punishment by dismissal from office for the crime of holding a political opinion differing from the ruling power. Unfortunately for the country, the iniquitous example set by President Jackson and his supporters has been but too faithfully followed, and sometimes made worse, by all succeeding Presidents down to the close of General Grant's administration, until it has become the most demoralizing and weakening influence preying upon our system of government.

The salaries of government officers are generally very moderate, and not large enough to tempt capable, reflecting men in professional life, business pursuits, and numerous other avocations from their regular employment to accept office for small pay and the prospect of so brief an official career before them. The result is that a large portion of our public employment under the "spoils system" too generally goes into the hands of small politicians and political adventurers, who make partisan politics and electioneering a profession, in the hope of getting quartered upon the national treasury. The "spoils system" is welcomed, and will always be sustained, by this class of people, as well as by many politicians of a higher grade, for it furnishes these latter with tools and workers for the party, and is supposed to be a means of strengthening it.

As the country increased in population, business, and wealth, and as the population expanded over a vast country full of natural wealth and resources of every kind, the patronage of the government increased and expanded with this development, until it has now become so enormous as to exceed that of any kingdom or empire on earth. In fact, by means of this pestilential "spoils system" the President of our republic wields a greater power through governmental patronage than all the monarchs of Europe, where civil service is regulated by law, and where no such system prevails. Our great army of office-holders, retaining their places at the will of the President, is variously estimated at from sixty to seventy thousand persons. I have not the means at hand of accurately estimating the number. Besides these, is the multitude of army, navy, mail, Indian, and various other contractors, more or less under government influence, swelling this great army of dependents with their families to hundreds of thousands, all to a large extent dependent upon government employment.

It is any thing but pleasing to thoughtful Americans to feel obliged to confess that a large portion of these men shape their political principles, work, and vote to suit those who control their living, and so sink their independence and fidelity to convictions of

duty to themselves and country into a mercenary obligation to the tyranny of party. A system that forces such results is the very nursery of sloth and hypocrisy, and an enemy of all true manliness and patriotism.

The disturbance in social life, the great inconvenience and, to some extent, misery, that such a system must and does create at every change of party in the national administration, is felt all over the country. Discharging such a multitude of people from employment, and turning them forth to seek new means of livelihood when all other business connections had long been broken up, and when they had become to some extent unfitted for a return to old employments, and calling an equal number of others from their avocations to fill the places of those removed, is any thing but beneficial to communities, to the country generally, or to the government service. Only a small percentage of the forty-five millions of our people can have offices, and those who do obtain them under the "spoils system" are not often the best type of our citizens. All the great mass of people ask or expect is to have their government well and economically administered. And this never can be the case under such an unstable system as one which gives men their appointments as a reward for political service, without any especial fitness or aptitude on their part for the duties required of them; the government never can be as well served as it would be by men selected for their fitness, competency, and trustworthiness, and by allowing these men to remain in their places as long as the duties intrusted to them are well and honestly performed.

To be capable of discharging acceptably the duties of any office, it is not enough that a man should always have been punctual in attendance at caucuses and conventions, and a faithful worker for his party. Such a record, although no qualification for entrance into the civil service, is too often all the examination required, and has long been a sure passport to places of high trust and responsibility. Several instances have come under my observation of men being sent as foreign consuls to commercial ports, to watch over and perform the difficult duty of protecting in various ways ship and sailor, and to guard the revenue against undervaluation of goods exported, who were entirely ignorant of shipping and commercial affairs, and were wholly unsuited to the position they came to occupy. Personally they were worthy men, but out of their proper places, and a well-regulated civil service would never allow them to find a way into a sphere so ill suited to them. In such cases the consul is really not at the head of his office, but is obliged to act by the advice and, to a large extent, be under the control of some one else—probably a for-

eign clerk. Another difficulty is that consuls are often appointed to take charge of important foreign consulates when they can not speak the languages of the countries to which they are sent. Consequently they can not be masters of the situation, but must be almost entirely at the mercy of the foreigners who surround them and upon whom they must rely for assistance.

Incongruities of a like character, although they may not often be so glaring, run through the whole civil service, and can not well be avoided as long as the appointments are made mainly upon political grounds, and made so generally through the influence of members of Congress, into whose hands appointments have so largely fallen, although they do not share any responsibility for the control they claim.

The evil effects of the practice show themselves in every branch of American politics, national, State, and municipal; but we will limit it to its connection and effects on our national politics. As already observed, members of Congress have, under the "spoils system," claimed and obtained, to a large extent, control over the distribution of appointments to office in their respective States, and also, in a measure, in the departments at Washington. Experience has shown that appointments so conducted are too generally made, not with a view to protect and maintain the efficiency and purity of the service, but rather to promote the selfish ends of members, and to redeem pledges given for personal service rendered in securing their nomination and election.

Appointments made in this way are rarely such as an impartial, prudent head of any department would select to aid him in the discharge of his duties. But he is overborne by the usage which has grown out of a system allowing members of Congress the control of certain appointments, and he is obliged to accept a work with such materials as are given him. The use and abuse of public patronage to promote these private ends is often so open and audacious as to be "seen of all men." Nominations for Congressional honors are frequently secured by what is termed "packing" the convention. The would-be member will select a few active men residing in different localities of his district, who are ready, for the promised reward, to be his tools. These men, by manipulating the primary meetings or caucuses, as they are called, for the selection of delegates to Congressional conventions, will secure delegates to that convention pledged to vote for their candidate, and this candidate in turn is pledged to secure for these "wire-pulling" friends who give him the nomination, offices of some kind, in case their party should win, without regard to their qualifications for filling decently and acceptably the places into which such

base political machinery may thrust them. Their side is victorious. Then comes the struggle of the member to make good his promises, and provide for the friends who have made him an M. C. He claims places for them, but, alas! the great army of place-hunters comes down upon the capital in such hordes that there are a score of candidates to one place that can be captured, and nineteen in every twenty find they have been led astray by false hopes, and have spent their time and influence among their voting friends to help some one into office who, having attained the goal of his own wishes, either can not or will not help them. They return to their homes disappointed and disgusted, not often "wiser and better men," but more frequently to try their fortunes over again in some new political venture. I do not aver that Congressional nominations are generally made in this way, only that they sometimes are, and probably more frequently than is known or suspected by the voters who elect those nominated by such political jugglery. It is not possible that the best, or even an average, class of public servants can be obtained by the aid of such machinery. The man who will stoop to secure an election by such instrumentalities can have no just claim to be considered an honorable man, much less can he be looked upon as a statesman fit to represent an intelligent people and legislate for the interests of a great country. He would be far more likely to take rank as a "ring" politician, and be found mixed up with schemes better designed to advance his own interest and the interests of party than giving his time and talents to his public duties.

It is mortifying to reflect that this pernicious "spoils system" has come to be a controlling element in most of our national elections. Though not openly acknowledged, and though kept under the shadow of set and formal questions put forward in political platforms, yet to gain possession of the national patronage is the most powerful motive that stimulates great numbers of politicians and their followers to intense activity. Indeed, many politicians oppose civil service reform upon the ground that control over the public patronage is necessary to keep their party well organized and in good working condition. It is the selfish and personal considerations that govern this class of men which imbitter and intensify our Presidential elections, and keep the whole country in a blaze of unhealthy excitement, seriously disturbing business, and often giving the canvass any thing but a fair expression of the candor and intelligence of the country.

Take away the hope of reward, not only would the canvass be equally interesting, perhaps equally earnest, but free from bit-

terness, and it would be an honest discussion of great national questions in which a large class of our most substantial men would take an interest—men who now too generally stand aloof, declining to mingle in a contest that seems to be carried on more to get possession of government plunder than for any purpose of public utility.

If the needed reforms in our civil service can be effected and made permanent, our elections would be conducted in a far more honest and satisfactory manner, and would be purged from the inflammatory excitements, extravagances, and dishonesty which now too often attend them. The country would be quiet and free from the agitation of office-seekers, and officials at Washington could attend to the duties their position demand, instead of devoting their time to audiences of the great army of patriots who make forced marches upon the capital at the inauguration of every President, anxious to enlist and serve in any positions that pay well.

Satisfied as we are, and have reason to be, with our own political institutions, may we not yet learn something from countries which have had many centuries of experience in civil government? The English civil service, although now brought to a high standard of honesty and efficiency, was, down to and through George the Third's reign, and later, far more corrupt in all its branches than has ever been the case in America; indeed, corruption and injustice often extended to the judiciary. Powerful lords and commoners actually owned a majority of seats in the House of Commons. They dictated who should be elected to Parliament, and often, very often, they sold seats in the House of Commons for thousands of pounds. So late as 1816, not over one-third the members of the House of Commons were elected by independent voters, limited as suffrage then was. When members thus bought their way into Parliament, we should naturally conclude that they would scarcely be proof against temptation when they got there. Administration measures were too often purchased through the Commons, and the king himself was a high bidder for votes with money, peerages, and other titles of honor. As one writer upon the subject says, "The king had patronage and court favor for the rich, places, pensions, and bribes for the needy."

Horace Walpole relates that to obtain votes in favor of Lord Bute's preliminaries of peace, "a shop was publicly opened at the pay office, whither the members flocked, and received the wages of their venality in bank-bills, even to so low a sum as £200 for their votes on the treaty. £25,000, as Martin, Secretary of the Treasury, afterward owned, were issued in one morning, and in a single fortnight a vast majority was purchased to secure the peace."

All under officers—civil servants as they are termed in Great Britain—were mere stakes played for by the higher officials, as they have come to be with us by the great political parties. The English nation at last became disgusted and alarmed at the magnitude of the evil, and turned for safety to remedial measures. By the exercise of great vigilance in guarding the purity of legislation, and by the adoption of a series of measures to raise the character of their civil service, the evil has been nearly, if not quite, overcome, and the English civil service is now brought so near to what such a service ought to be, that in most respects it is a model for imitation. Competitive examinations have been adopted in all branches of the service, and when new appointments have to be made, the best qualified and most meritorious are accepted. Politics and politicians have no influence over appointments, and, of course, members of Parliament control no patronage. When a new ministry comes in, there is no change of officers, excepting those composing the actual members of the government, such as the cabinet ministers, under secretaries of state, lords of the treasury, the law officers of the crown, and a few others having special relations with the government. Those actual members of the government go out with the retiring ministry; but removals for political reasons are now unknown in the administration of the English government, and no removal is ever made as long as the officer is faithful and efficient. On the contrary, they have a carefully arranged system of pensions, so that when a good officer is worn out in his country's service, he may not be turned adrift penniless. To this desirable condition has experience and necessity brought the English civil service; a similar experience and necessity have finally turned public attention to the importance of a most radical reform in the same branch of service in our own country.

The President and his cabinet are now engaged in earnest attempts at such a reform, and, so far as we can judge by what they have already accomplished, with a firm determination to persevere and carry it through. They will, no doubt, be strongly opposed by partisan politicians, and probably efforts will be made to check the progress of their work; but they have the sympathy and support of the country to sustain them in their patriotic endeavors, and their reforms will be carried to a reasonable, and it is to be hoped to a high, degree of success.

But now comes the very grave question, How can these reforms be made permanent as the established policy of the country? The next administration may overthrow all that has been accomplished, and return to the vicious system which the country condemned in the late Presidential election.

The reforms are now but an administrative measure that may be strengthened and made more difficult to set aside by well-considered laws, and, if need be, by constitutional amendments.

It is true that in making appointments it was intended that the Senate, as a part of the appointing power, should share the responsibility with the President, and be some security against bad appointments. We know that the very object of the framers of the Constitution in creating this joint action in regard to appointments to office was to give the country all the protection they could against improper appointments. Had the Senate always acted in harmony with this object, and rejected all merely political nominations, our civil service never could have been made a party instrument, and the "spoils system" never could have found a foot-hold in our government. But if a body of men who it was intended should act judicially on the subject of confirmations, and to sit in impartial judgment on the fitness of candidates for the places to which they were nominated, has, in obedience to what has been thought to be a political doctrine of the two great parties, adopted the obnoxious system, and if these men claim to control the patronage of their States and to distribute offices among their friends upon political grounds, it is to be feared they are not the men upon whom we should now rely for aid in reforming the civil service, and for protection in the future against a return of the "spoils system."

If we have the protection neither of clearly defined constitutional provisions on the subject of removals, of suitable laws regulating the tenure of office, nor of a Senate earnestly imbued with the spirit of reform to aid the Executive in his difficult task, the chief support must come directly from the people. The popular will, if always vigilant

and ready to move strongly in support of a reformed civil service, must be its best protection. But will the people be ever upon the watch to guard it against encroachment and overthrow? Is there no fear that after a few years of its quiet and successful operation they may rest in confidence that it has become established by usage as the law of the land, and while they slumber in this fancied security, that the time may come when another powerful party may get control of the government, intent on perpetuating its own power by the aid of government patronage distributed as reward to active partisans?

Laws regulating the whole subject of appointments and removals will afford some protection, because they would stand in the way of immediate action on the part of a new Executive, and would have to be removed ere he could begin the work of proscription.

A motion to repeal these laws would be a note of warning and alarm to the people, and they could soon make their power felt so forcibly in the halls of Congress as to stop all interference with the subject. The safest plan, after all, is for the people to take the civil service under their own protection, and never let it again pass into the hands of partisan politicians. If the people will be on their guard, and take care that no candidate for office be nominated by these politicians, and that no delegate unfavorable to a reformed civil service be sent to any political convention, that no candidate for President, Vice-President, or Congress be nominated, or United States Senator elected, who will not heartily support such a service and oppose a revival of the corrupt system inaugurated in 1829, this will be the best security the country can have that our reformed civil service will not be interfered with from any quarter capable of doing it harm.

AMURATH IV.—A.D. 1638.

"And the repeated air
Of sad Electra's poet had the power
To save the Athenian walls from ruin bare."—MILTON.

WHEN Sultan Amurath, "the Cruel," led
His barbarous hordes o'er Bagdad's battered wall,
And of its prostrate throngs devoted all
To slaughter dire, by battle's vengeance fed,
A Persian youth, unawed by scene so dread,
Drew from his harp such tones, so sadly sweet,
The conqueror paused with each melodious beat,
Till from his soul the demon Fury fled;
His fierce command recalled, he now bade spare
Bagdad's dejected people and their homes;
So all its airy minarets and domes
Still swelled toward heaven and echoed calls to prayer;
Nor could this victor Music's self refuse
That grace once yielded the sad Attic Muse.

Editor's Easy Chair.

ONE beautiful June evening in Paris the Easy Chair strolled with a friend into a café upon the Boulevard. They had been to hear *Robert le Diable* at the French Opera, and gayly humming and gossiping they sat upon the broad walk that was still thronged on the still summer night. Presently a dark-haired man came quietly along and seated himself at a table near by. He was alone, and seemed not to care for recognition. He was simply dressed, and was entirely unnoticeable except for the strong Jewish lines of his intellectual face. The Easy Chair's companion whispered, "That is the man to whom we owe the delight of this evening; that is Meyerbeer." After a little while he added, with feeling, "How much we owe to the Jews, and how mean Christendom is!"

It was remarkable how much of the conspicuous work and influence in the world on that evening was due to the genius of a people whose name is so constantly used as a word of reproach. A few months before, Mendelssohn had been buried in Leipsic, and in Berlin the Easy Chair had heard the memorial concert of his music at the Sing Akademie. Rossini was still living, and Verdi was writing operas, but Mendelssohn and Meyerbeer were the recognized masters of music. The evening before, the Easy Chair had seen the Jewess Rachel in *Phèdre*—the one woman who contests the laurel with Mrs. Siddons, and who was then incomparably the great living actress. Beyond the Channel, Disraeli, the child of Spanish Jews, was just about to kiss hands as Chancellor of the Exchequer, and to become the political leader of the British Tories. In the vast city in which they were sitting, the Easy Chair knew that the Jewish Heine was living, breathing his weird and melancholy song, while in Paris and London and Frankfort and Vienna the great masters of the mainspring of industrial activity, the capitalists who held peace and war in their hands, and by whose favor kings ruled, were Jews. The philosophy, the art, the industry, the politics, of Christendom were full of the Jewish genius; the gayety of nations, the delight of scholars, the sceptres of princes, the movements of civilization, hung in great degree upon it. It is as true to-day as in that old summer night, and the words of the Easy Chair's friend are still as shamefully true, "How mean Christendom is!"

Recently in New York an estimable and accomplished gentleman was rejected as a member of the Bar Association "for no reason that can be conceived," indignantly said one of the leading members, "except that he was a Jew." Doubtless a few votes would procure the rejection. But the association is not a social club, and presumptively a man who is an honorable member of the bar is a fit member of the association. The few hostile votes, however, represent the prejudice. It is very old and very universal. To the audience of to-day there is nothing in Shakespeare more vital and intelligible than the fervent appeal of Shylock to the common humanity of the world around him. The Jew is still separate, and the prejudice which has pursued him for generations is but slightly relaxed. The lines of demarkation are fine. They are often almost invisible. But they are deep, and apparently absolute. It is one of the most common

and most tenacious of the objections to *Daniel Deronda* that it deals with Jews and Jewish life and character. The fact is sometimes almost resented as an offense to the mass of readers. Even in *Ivanhoe*, although torrents of Christian tears have flowed over the closing pages, where the noble and beautiful Rebecca asks to see the face of the fair Rowena, yet such is the fell and weird outlawry of the Jew from general sympathy, that the catastrophe seems to be an inevitable fate. There is no doubt that this prejudice is as cruel in its effects as it is unreasonable in its origin. Distrust, alienation, a nameless scorn, or by whatever term the feeling be described, fatally chills and discourages the man or the people upon whom it falls. One of the most intelligent and accomplished colored men in this country was so tortured by the prejudice against his race that he said he would gladly be flayed alive if only he could be made white. A slave-holder, trying to prove to Gerrit Smith the "natural inferiority" of the colored man, said to him that although the white and colored children played pleasantly together in perfect equality, yet when they grew older the difference of inferior and superior became evident. Mr. Smith replied that the change was due not to conscious inferiority, but to the consciousness of the negro of the awful stigma of slavery upon his race. A people is oppressed, and the arts by which it avenges or defends itself are urged as reasons for oppression, or drooping despair of successful resistance is claimed as the justification of tyranny.

The legend of the Wandering Jew has a pathos beyond the usual interpretation. The story is that the Jew, who refused to comfort Christ as He toiled under the weight of the cross, was condemned to tarry until He came, and so wanders around the world until the second coming. But it is the symbol also of the restlessness of the race, roaming through Christendom homeless and rejected. It is the curse, says many a zealous Christian heart, of the people that crucified the Redeemer. This is the common theory of the origin of the traditional antipathy to the Jews, and undoubtedly this is with many persons a vague justification of the feeling with which a Jew is regarded. But should it be nothing to such persons that when, as they believe, the Creator would incarnate Himself, He became a Jew? Or, again, do they reflect that if it was in the eternal decrees that the sins of men were to be atoned and condoned by the innocent sacrifice, those who accomplished the sacrifice were but the agents of the Divine will? Are all such ingenious speculations other than devices to explain and justify a mere prejudice of race, such as some African tribes cherish against people of white skins? Those who find in such prejudice a profound significance will continue to plead the feeling as its own sufficient reason. But honorable men will be careful how they heedlessly use the name of a race to which the religion, the literature, the art, the civilized progress of humanity, are so greatly indebted, as a term of utter derision and scorn.

MISS ANNA DICKINSON's resolution to change her career, and to be an actress instead of a lect-

urer, was characteristically courageous, and appealed to the admiration which always attends pluck. It was not, as is generally understood, a sudden determination. Indeed, the stage, as we are told, and not the platform, was her original preference. However that may be, the choice was certainly not surprising, although success was more difficult when she had not only accustomed the public to her appearance as a lecturer, but had accustomed herself to the conditions of the platform, which are very different from those of the stage. There was one thing, also, for her constantly to remember—that an audience is not a person, and that the actress would be judged independently of the lecturer, or even more severely because of the lecturer. She should have anticipated—and perhaps she did anticipate—a little resentment on the part of her old admirers, and a curious distrust among her new audience. The lyceum is more earnest than the theatre. The platform is a lay pulpit; the stage is a recreation. We do not deny that Shakespeare may be as wise a teacher as Jeremy Taylor; we say only that people generally go to the play to be amused, and that they often go to a lecture for a more serious purpose.

Inevitably, also, with these exceptional disadvantages for her new venture, when she first appeared upon the stage, the mistress of the lyceum would be sharply compared with the tyro of the theatre. The critics could probably not escape the feeling that the change was a whim, and involuntarily they would be on the alert to see what they anticipated. They had probably seen her often upon the platform, and they had, perhaps, decided from that observation that she had not the histrionic faculty. The ordeal of a novice was never more severe than that of Miss Dickinson when she appeared upon the stage, and it was not surprising that after some months, stung by what she felt to be singular unfriendliness, she should have fallen back upon a resource the force of which she knew and which the world had approved, and in the guise of the actress suddenly change the stage to the platform and lecture her critics.

Her speech was a plea for fair play. She protested against misrepresentation, and without denying that great genius might defy calumnious falsehood, she showed a proper consciousness of the immense power of the press, with which it might thwart for a time legitimate success. If her assumption was correct, and the critics of the city had combined to deride and belittle her performance, it was no answer to her to say that if she were a great actress, the critics could not conceal the fact. That might be true. But the critics could certainly prejudice the public mind, and delay the recognition of her talent. Her plea was an outburst of impatience, which showed how deeply she felt the shafts that had been flown at her. It was unquestionably an error; for having chosen the kind of art to which she would devote herself, there could be but one vindication of her choice. We understand, of course, that her speech was not meant as such a vindication, and only as an appeal for an impartial hearing. But Miss Dickinson will remember that when the House of Commons laughed and coughed and sneered and crowded Disraeli down, he merely shook his fist at them, and shouted that one day he would make them hear. He conquered at last, not by pleading with them for fair play, but by compelling

them by the power of his eloquence to listen. Miss Dickinson's triumph would have been absolute if she had silently waited, and finally have stood upon the stage before her critics indisputably great and commanding even their admiration.

It was objected that she seemed to suppose that she could at once take a chief place in her new profession, instead of understanding that she could not expect, without long and careful special training, to rival those who have been for many years in practice. But even if this were true, why not? Sudden success upon the stage does not always nor necessarily depend upon will, nor long study, nor special training. There was no reason whatever that she should not immediately take a chief place if she had the essential histrionic talent; and if she had not, it made no difference whether she began as Anne Boleyn or Anne Boleyn's maid. We do not say, indeed, that the want of such success disproves the existence of the talent. Disraeli's failure certainly did not prove that he could not be an orator. There is no rule, and this the critics seem to have forgotten. Their verdict, upon this count at least, implied that Miss Dickinson needed only training and experience to become a chief actress, and that her error lay in claiming at once what she could not justly claim until later. But there is an unsound assumption here, which is that histrionic greatness or success comes only with time and practice. Experience, however, shows that this can not be truthfully asserted. There are, of course, stage details which are to be mastered only by experience. But these are very unimportant to the real issue. There are scores of ladies and gentlemen who appear upon the stage every evening engaged in an arduous service, for which we trust they are well repaid. But have constant years of practice and "special training" brought them any nearer to the chief places in their profession? On the other hand, if a man who has in him the possibility of great acting goes upon the stage ignorant of many of the details and totally unfamiliar with "business," that fact need not and does not always prevent the sure impression of his power upon the audience.

Hard work and training, indeed, can not be disregarded by any aspirant in any direction. But while it is a serious error to suppose this, it is no less an error to suppose that work and training can take the place of native power and adaptability. If the representations of the critics upon her first appearance were correct, all that could fairly be inferred was that Miss Dickinson was not yet a great actress, but nothing more. It was impossible to predict whether she ever would be or would not be. The fallacy lay in the assumption that time and practice might make her so. For if that could be confidently asserted, it was because her latent power was perceived. How immediate and complete a stage triumph may be, was shown in the début of Miss Fanny Kemble. She had no desire to act, and, as she says, no taste for the theatre. Until within a very short time of her appearance she had no thought of going upon the stage. Then her mother drilled her; and at length, on a famous evening in October, 1829, when she was but eighteen years old, at Covent Garden Theatre, she came, was seen, and conquered. The play was *Romeo and Juliet*. Charles Kemble, her father, was Mercutio. Her

mother was Lady Capulet. Miss Kemble was Juliet. "Our hearts did not breathe freely," said Talfourd, in the *New Monthly Magazine*, "till the fair débutante herself had entered, pale, trembling, but resolved, and had found encouragement and shelter in her mother's arms. But another and a happier source of interest was soon opened, for the first act did not close till all fears for Miss Kemble's success had been dispelled; the looks of every spectator conveyed that he was electrified by the influence of new-tried genius, and was collecting emotions, in silence, as he watched its development, to swell its triumph with fresh acclamations. For our own part, the illusion that she was Shakespeare's own Juliet came so speedily upon us as to suspend the power of specific criticism—so delicious was the fascination that we disliked even the remarks of the by-standers that disturbed that illusive spell; and though, half an hour before, we had blessed the applauding bursts of the audience like omens of propitious thunder, we were now half impatient of their frequency and duration, because they intruded on a still higher pleasure, and because we needed no assurance that Miss Kemble's success was sealed."

If it be said that genius is an exception to all rules, we shall not deny it. But we shall nevertheless repeat that in this matter there is no rule. Talfourd said that Miss Kemble seemed to know the stage by intuition, and trod it as if matured by the study and practice of years. Edmund Kean, on the other hand, who was upon the stage almost as soon as he could walk, very slowly made his way in his profession, and was twenty-seven years old before he conquered London as Shylock.

Miss Dickinson may be sure that, even if criticisms are unfair, the public is just to its own perceptions, and if, whether sooner or later, she justifies her confidence in herself, the public will most gladly acknowledge it.

A CENSOR of the minor morals and manners is, of course, constantly observing the aspects of the temperance reform. He knows, as every Spectator and Tatler and Guardian and Connoisseur and Citizen of the World knows, that if the improper use of intoxicating liquors could be stopped, both the minor and the major morals and manners of the community would instantly mend to a degree that would portend an immediate millennium. One of the first steps in the good journey has been hitherto very much neglected, and that is, learning from the enemy. Does the courteous reader remember the Striped Pig, which was very famous in its day? A rigorous law had been passed prohibiting the sale of liquor except in large quantities. A man and his friends might be very thirsty even at a General Training, and might be seriously bent upon a lively day, but they would hesitate at sitting down or standing up to seven gallons of New England rum or rye whiskey; and this was for them the unpromising situation on a certain training-day in New England. On all such days there are always peripatetic shows upon the ground, and on this particular day, on that particular ground, there was a tent with a large flag gayly flying, announcing that the celebrated Striped Pig could be seen within upon the payment of a small fee of admission, which chanced to be precisely the price of a dram. It was remarkable how attractive

that exhibition gradually became. A few loiterers dropped in during the early part of the day with a listless air, but presently emerged with an aspect of such animation that there could be no doubt of the satisfactory nature of the spectacle. The news flew. The crowd came. The interest in natural history was prodigious. The price of the lesson was most cheerfully paid, and the zeal of many students was such that several lessons were not too many for them. The instruction appeared also to be of a most cheerful kind. The contemplation of this singular freak of nature, the Striped Pig, was plainly attended with the most enlivening results. A general hilarity pervaded the field, and the masterly evolutions of the county troops seemed to be forgotten in the charms of the scientific wonder in the tent.

The sagacious reader, of course, guesses the secret. Had he been on the field, his intelligent curiosity would have drawn him with the crowd to the tent. He would have paid the modest entrance fee. He would then have passed in and have seen a youngling, a pigling, painted neatly in alternate stripes of a decided color, and when he had fully satisfied himself with observing it, the generous proprietor would have offered him a glass of the best New England or rye, *without charge*. You paid, in fact, to see the interesting animal, and the manager of the exhibition "treated" you. Here, at the very beginning of the contest between the restrictive laws and the "liquor interest," had you been as quick an observer as you were a true friend of temperance, you would have seen that interest nimbly outwitting the law, and you would have learned of the enemy to be as witty as he.

Not long after this famous exhibition the Easy Chair was in a town where the liquor law was very strictly enforced. A company of gentlemen at the hotel proposed to have a glass of wine. They descended to the office, and one of their number whispered mysteriously to the host. There was a responsive light of intelligence in his eye, and a grave and urbane shake of the head. He moved from behind the counter and passed through a door, and the company of gentlemen followed him. The door was closed, and the host lighted a lantern. He then opened another door, and descended a dark staircase into a dark cellar, followed by the gentlemen, whose conversation began to falter. Reaching the floor, they poked and groped in the dim light among boxes and barrels and amid the unsavory smells of a cellar. The host paused at the door of a little room and unlocked it. The gentlemen entered with him, and he turned the key upon the inside. An obscure light struggled in through a cobwebbed window at the level of the ground. It was an utterly dismal closet, with nothing in it but two old flour barrels standing upright, with an unplanned board lying across them as a table, on which stood a black bottle and half a dozen cloudy tumblers. The gentlemen were silent. They seemed to be a company of sneaking conspirators. Some of them drank a little wine. Some preferred not to drink it under such humiliating circumstances. All groped back again through the cellar, and emerged into the cheerful daylight wiser and sadder men.

Here was another most pregnant hint for the knights of temperance. It was plain that when the law had driven strong drink into a damp and

dingy cellar closet where its use had lost half of its danger by becoming shameful and disgusting, a damaging blow had been struck at dram-drinking. If such drinking could be dissociated from brilliant and attractive rooms, convenient of access, and flaunting their tinsel splendor upon the street like other wantons and decoyers, half the danger to young men would be avoided. They do not especially care to drink. But it is so easily done, and done in such gay society, that before they are aware they are thralls to an appetite as insidious and fatal as the perfume of Rappaccini's flower. Banish the opportunity to a dismal cellar, brand dram-drinking as illicit, disgraceful, sneaking, and a great victory would be won. This, as the Easy Chair is assured by temperance advocates, is the object of prohibitory laws. They are not intended for the reform of old toppers, they are to prevent the growth of new. They aim to diminish dram-drinking by making it disreputable and difficult.

Why do not those advocates learn of their own wisdom? They would limit dram-drinking by depriving it of attractiveness. Why do they not stimulate temperance by making it attractive? The Genius of Temperance is apt to appear to the dram-drinker in one of two forms—either that of the religious zealot, who opens the door of the bright warm bar-room on a winter evening, looks gloomily in, and says, tersely, "You're all going to —;" or in that of the constable, who says, in effect, "You sha'n't drink." These remarks are addressed to poor people whose homes are not inviting. What alternative is offered to them? If you send them out of the bar-room for fear of —, where shall they go? If you take them legally by the collar, and turn them into the street, will they find it pleasanter than the room from which they are expelled? Now, is it not wise for those who by liquor laws are trying to send the bar-room into a dark damp cellar, and to make it disagreeable in every way, to provide in its place a resort which shall be agreeable in every way? If a very large part of the money which is expended for lectures and papers and tracts upon the evils of dram-drinking were devoted to maintaining resorts pleasanter and more attractive than the corner grocery and the brilliant bar-room, the good cause would certainly prosper no less than now. That would be putting the wits of temperance men against the dram interest, as the striped pig was the wit of the dram interest against temperance. It would be pushing home the victory won by sending the bar down cellar, because for every forlorn loiterer whose home is but a cold, dark, desolate chamber it would provide a cheerful and attractive parlor, with games, papers, pipes, and innocent drinks.

This would be legitimately fighting the devil with his own weapons. It would be a kind of "moral suasion" which the severest advocate of severe laws could not deprecate. It would be the introduction of a kindly wisdom into a movement which often seems cold as the water it reveres. The Genius of Drams would be balked and bewildered by an attack which borrowed its tactics from his own. Undoubtedly it would take money and time and trouble. But a community which is not ready to pay that price for temperance is not yet ready to buy. Preaching the wickedness of dram-drinking, and enforcing pro-

hibition even at the point of the bayonet, will not be so efficient an assault as turning the flank of the enemy by making other resorts for recreation cheaper and pleasanter than dram-shops.

A BRIGHT little article in the New York *Times* recently commented, with good-humored satire, upon the American ladies who go abroad, and presently come home calling "coal" "coals," and "really" "weally," and remarking that a friend is very much "cut up" by the loss of a child. In other years this kind of American lady or gentleman returned and informed its friends that the club dinner was "awfully jolly," that Mrs. Stomacher's new crimson velvet was "stunning," and that the young Viscount Lewith was "just the nicest person in the world." The *Times* points out that all this extraordinary use of the English language comes from the fact that the little lady has been to a few dinners and country-houses in England, and has remembered to imitate only the least desirable expressions current in conversation. This effect of the oppression of foreign "grandeur" is comical. Imitation is undoubtedly homage, and the London dandy who says "weally" and "fealleawe" must have a certain gratified but contemptuous amusement in hearing the American snob imitating his affectation.

The imitation of English affectations, as well as of better English things, is not new. It is not very many years since the praise of a young gentleman's manners that they were "so English" was most grateful. The English manner was then apparently supposed to be a supercilious indifference. *Surtout, pas de zèle*, was the true gospel of the drawing-room. Mr. N. P. Willis had mentioned that in English society "scenes" were vulgar to the last degree; so it was necessary for the American gentleman to part with his friend, setting out to circumnavigate the globe, as if he were passing him upon the street, and to receive his most intimate companion after long absence in foreign lands as if he had parted with him at breakfast. The same feeling that eschewed "scenes" also condemned warmth or amplitude of expression. "How do, old feller!" was the maximum of ardor in greeting. If you had been on your travels, Mont Blanc was jolly, and Sorrento was nice. Things did very well. Of course it was not worth while to make a fuss. No gentleman does. But the world was rather a bore. A cock-fight, to be sure, or a shot at pigeons, might be worth attention. But never mind; 'twas all right.

This was a most ludicrous effect of going abroad. But it is very much older than our time and its travellers. Sir Philip Sidney speaks of the young Englishmen of his day who came home from the Continent "full of disguisements, not only of apparel, but of our countenances, as though the credit of a traveller stood all upon his outside." He adds a prophecy, which Shakespeare made haste to fulfill to the very letter. Sidney says, in 1578, "I think, ere it be long, like the mountebanks in Italy, we travellers shall be made sport of in comedies." Twenty years afterward Shakespeare makes Rosalind say, in *As you Like it*, "Farewell, monsieur traveller: Look you, lisp, and wear strange suits; disable all the benefits of your own country; be out of love with your nativity, and almost chide God for making you that countenance you are; or I will

scarce think you have swam in a gondola." There have been American gentlemen who after a turn in Europe have returned with a slight foreign accent in their speech. Indeed, so subtle and controlling is the foreign influence, as Sidney and Shakespeare saw it in their England, that it may fairly be asked whether Jefferson was wrong in insisting that no American minister should live abroad more than seven years, because in that time he was unconsciously alienated in feeling from his own country. The English diplomatic service opens a career in which, while the minister resides continuously abroad, he rises by promotion from one court to another. But when a British minister of high standing and long service was in company with a sagacious citizen of the country to which he was accredited, the citizen remarked that he was a most excellent man, but that he did not represent England.

We Americans are not usually backward in asserting the greatness and superiority of our own country, and it is doubtless a reactionary feeling from this vulgar boasting which leads many Americans to the other extreme. Lest they should be thought to be of the gross herd who brag and swagger about America, they depreciate it, and by identifying that grossness with Americanism, they not only stimulate their own repugnance, but they feed that of the foreigner. He naturally says that if intelligent and well-bred Americans recoil from their own country, and are evidently a little ashamed of it, it is even worse than has been represented. This is one aspect of the mischiefs for which such Americans are responsible. The truth is that in the reasonable and not the vulgar feeling in regard to the greatness of our own country lies the secret of the self-confidence which is indispensable to really good manners. It is not the insolent assumption that America is in every way the greatest and best of all countries, but the conviction that it is certainly the peer of the best, which will give an American the proper equipoise against the self-assertion of other nationalities.

There is, however, a more complete and a perfect security, and that is, not a just respect for his country, but for himself. Then in every company he will be easily at home.

IN commenting upon the verdict in the case of the Ashtabula disaster, the Easy Chair suggested that the only practicable remedy against such catastrophes lies in prompt and vigorous suits and exemplary damages. This assumed, of course, that the officers and managers of the road were primarily responsible, and that they could be reached effectually only through the pocket. It carried with it, also, a covert implication that there was a criminal carelessness which merited the severest penalty. A friend who is thoroughly informed of all the facts in the Ashtabula case, and who speaks with accurate knowledge in regard to the management of the Lake Shore road, tells the Easy Chair that it has done great injustice both to the railroad company as a body and to certain individuals who were held to be peculiarly responsible for the calamity. This friend states—what is certainly not generally known, and is most creditable to the management of the road, and what, also, entirely relieves it from any charge of indifference made or implied by the Easy Chair or any other critic—that the railroad

officers, without waiting for any legal action, have been paying, ever since the day of the catastrophe, as heavy damages as any court would allow to the wounded and to the families of the dead. They have even sent agents to distant States to those families which were left destitute, with the full amount of the indemnity which a successful lawsuit would have secured them. The accident will probably cost the road more than half a million of dollars, besides the immense loss of reputation.

More than this, the chief managers of the road are gentlemen of the highest honor and of educated conscience, who would suffer as keenly as any men could suffer at so terrible a catastrophe. One of their number, indeed, the late Mr. Collins, was driven mad by the thought that thirty years of unquestioned fidelity and success apparently availed nothing whatever in public estimation when the casualty occurred. It is monstrous to assume, urges this friend—as the Easy Chair did—that such men do not care whether their bridges fall, and their trains are wrecked, and hundreds of lives are lost, and that the only way to teach them common-sense and common humanity is to fine the road heavily.

The same friend, who speaks with the authority of ample personal knowledge, also states that our condemnation of the engineer, Mr. Stone, upon the verdict of the coroner's jury, is especially unjust. He says that the verdict was founded mainly upon the evidence of discharged employes of the road, who were dismissed with good reason. Against their testimony, however, was that of eminent engineers like General Carrington, Mr. Morton, and others. Mr. Stone had had a lifetime of experience in bridge and railway building. He was certainly an engineer of great distinction and of approved skill. The best engineers thought the bridge a good one until it fell. Then it was not difficult to testify that if it had been built differently it might not have fallen.

"Of course," says our friend, "you have the conclusive answer, 'The bridge fell.' But it will add nothing to our stock of information as to the best way to prevent such calamities in future, to assume that it fell for the reasons alleged—because Mr. Stone did not take somebody's advice, because people are lax about suing railroads for damages, because Mr. Collins did not inspect the bridge, or because the managers of the road care nothing for human life."

However just or unjust the comments of the Easy Chair may have been, it can not regret that they have been the occasion of eliciting this evidence of the really careful management of the road, and of the high character of those to whom the public have naturally turned for the explanation of the catastrophe.

THE Easy Chair has space for but a word about the dedication of the Halleck statue in Central Park. It was one of the most memorable and beautiful of such occasions. The day was perfect May; and the presence of the President and of Halleck's fellow-singer Bryant, with the tender poem of Whittier and the eloquent and admirable address of Mr. Butler, gave the event peculiar significance. It was not so much homage to the pleasant poet whose verses are familiar to every American as it was a recognition of the poet as one of the powers of the state. Shakespeare and Goethe and Humboldt were already commemorated in the Park, but

Halleck's is the first statue of an American poet raised under such auspices. Could he who so loved New York have foreseen such a tribute, in such a spot, on such a day, under such auspices,

and in the approving presence of so vast a throng of New Yorkers, he would almost have prayed for his *nunc dimittis* that the happy day might dawn.

Editor's Literary Record.

The Cruise of the Challenger (Harper and Brothers) is made up by W. J. J. SPRY, R.N., of the Engineering Department, from his daily journals. The object of this cruise round the world was not the discovery of new continents or islands, but the exploration of the bottom of the sea. After two brief attempts by the British government to explore the ocean bed by the *Lightning* (1868) and by the *Porcupine* (1869-70), the *Challenger*, a corvette of 2000 tons and 400 horsepower, was assigned to a long cruise—one which actually lasted from 15th November, 1873, to 12th June, 1876. The course pursued was from the Thames River to Gibraltar; across the Atlantic to the West Indies; north to Halifax; thence south again to the Bermudas; across the Atlantic again to the Canary Isles and the Cape Verd Isles; thence southwest to the coast of South America; back again through the South Atlantic Ocean to the Cape of Good Hope; thence by a crooked route across the Indian Ocean to Australia, reaching *en route* a point as far south as 66° to 70° latitude; from Australia to New Zealand; back again to Australia; back and forth through the Malay Archipelago, touching at Hong-Kong; thence, still by a circuitous route, across the Pacific; and so, *via* Cape Horn, home again. Such a tour gave to the author, if not a thorough, at least a wide, acquaintance with the world, and his book may be characterized as a bird's-eye view of all nations. He gives a brief account of the apparatus provided for the dredging and deep-sea soundings, but leaves the scientific results of the explorations to be given hereafter by Sir Charles W. Thomson, under whose direction the scientific staff was placed. The book is fully illustrated, and though the author makes no attempt to give detailed and elaborate descriptions of any one locality or people, we know of no book which covers an equal amount of ground, or introduces the reader to so many and so various scenes.

Charles Kingsley: His Letters and Memoirs of his Life, edited by his Wife (Scribner, Armstrong, and Co.), is presented to American readers in an abridged edition, two volumes reduced to one. The work of abridgment was the last literary labor of the lamented EDWARD SEYMOUR. Nothing else need be said as an assurance to the American public that the work has been well done. The result will be to bring within the reading of the American public a life which is full both of instruction and of inspiration, but which only a few would have read in the larger edition. Canon Kingsley was a rare man, and the story of his life at once humiliates and inspires. He possessed the *physique* of an English athlete, the spirituality of a mediæval mystic, and the love for humanity of a modern philanthropist. He was a Churchman without being an ecclesiastic, a freethinker without being a skeptic, and a humanitarian without being a *doctrinaire*. The record of his life is re-

markable for the amount of work which he accomplished, but this is not its most remarkable characteristic. Other men have been, perhaps, as industrious, and achieved as much as he; that which strikes us as the central fact of his life, as the illuminating centre, making it all to glow, is the unconscious spirit of self-sacrifice which pervaded it. He was a man of rare mental and physical power. His temperament made him eager for the fray; he was by nature a warrior; a Samson who delighted in feats of strength for the mere pleasure of doing them; a man of large resource, and of consciousness of resource. He lived, too, in a time of battle, when England was all aflame with agitation; and he felt keenly the wrongs which a defective social organization inflicted upon the working people, and saw clearly the blunders into which the selfishness and the self-conceit of their leaders were bringing them. He could write a placard to be posted on the walls of London whose nervous eloquence made it read by the thousands. He could speak in a church or hall in London to an excited throng and turn the current of their passionate feeling from the dangerous course in which it was rushing. Not only he could do these things, he rejoiced in the doing of them. And yet he could go quietly down to his little country parish at Eversley and there devote himself to the detailed work of a country rector, living on a small salary in a dilapidated house, with uncongenial society, preaching to a small congregation, and devoting himself with enthusiasm to the work of house-to-house visitation. It was a most uncongenial parish. Before his coming to Eversley the church services had been utterly neglected—often, for trifling cause, were omitted. He found the ale-houses full and the church empty. The confirmation classes were accustomed to go over to a distant parish, and confirmation time was made an occasion for junketing, and often for dissipation and drunkenness. At the beginning of his ministry there was not a man or woman among the laboring class who could read or write. The farmers' sheep were turned to browse in the neglected church-yard. Communion was celebrated only three times a year; the alms were collected in an old wooden saucer; a cracked kitchen basin inside the font held the water for baptism; the altar was covered by a moth-eaten cloth; one old broken chair stood beside it; and so conservative were the church-wardens that the new rector was for many years obliged to provide the wine for the monthly communion out of his own pocket. Yet here a man who had the capacities of a reformer, of an orator, of a pamphleteer, of a novelist, of a poet—perhaps we might also say of a politician and a statesman—spent the greater proportion of his life labors, visiting in the week from house to house, going sometimes five or six times a day to the bedside of the sick or the dying; maintaining cottage readings and neighborhood devotion-

al meetings; talking with the whips and the stablemen of a neighboring estate; reading by the hour together to an old woman too blind to see to read herself—in short, doing all that detailed parish work which men of much smaller abilities than himself would account drudgery, and doing it with a hearty enthusiasm and a genuine interest, as though his eye had never seen a wider horizon, his ambition had never felt the spur to a larger work, or his powers the capability to do it. The story of so Christian a life ought to be at least in every parish library, and any church which sees that its pastor is supplied with this book will find more than a recompense in the increased earnestness and consecration of his parochial labors. It ought to be added that the book is valuable as a historical contribution, for it gives an interior view of that period of conflict in Great Britain which was only saved by the solid common-sense of the Anglo-Saxon race from becoming a period of revolution.

The discoveries of Dr. Schliemann in Troy have awakened a general interest in Grecian antiquities. The war in the East has turned many thoughts to modern Greece. J. P. MAHAFFY, in his *Rambles and Studies in Greece* (Macmillan and Co.), introduces the American reader both to the antiquities of the Greece that is past and to the life of the Greece that is present. Mr. Mahaffy has made a study of Grecian character, history, and literature. His pages give not the crude impressions of an uninformed traveller, but the well-digested conclusions of a careful and trustworthy scholar. The illustrations, from photographs, of Grecian ruins and marvels add to the attractiveness of the volume. Mr. Mahaffy is not an enthusiastic admirer of Grecian character. He speaks in honest and sharp though kindly criticism of the Grecian defects. And yet, on the whole, his work gives us a pleasant impression of the modern Greek, and a brighter and better hope for his future than we had before entertained. He accounts the modern Greeks vastly more intelligent, more peaceable, and more civilized than the inhabitants of Bulgaria, Servia, and Montenegro, and he expresses the conviction that the best method of settlement for the Eastern question would be the organization of a new Macedonian kingdom, with an enlargement of the boundaries of Greece, and with Constantinople for its capital. Mr. Mahaffy is not, however, a republican. He does not believe in self-government for all people. He even insists upon it that "hardly any nations in the world are fit for parliamentary government," and maintains that "the best form of rule for them [the Greeks] would be an intelligent and disinterested dictator, like old Pittacus, chosen, as the king was, by themselves, but intrusted with the interests of the country for a considerable number of years." Mr. Mahaffy's descriptions of Greek scenery are picturesque and graphic; and whether the reader agrees with his conception of Greek character or not, he will at least concede that the author has shown considerable power as a portrait painter in depicting it.—The Harpers add to their "Half-hour Series," mentioned last month, *Epochs of English History*, a series of books narrating the history of England at successive epochs. The eight volumes of this series trace the history of England from the time prior to the Norman conquest down to 1875. They are prepared by different authors,

are written in a simple and easy style, deal with the important facts, omitting dry and unimportant details, concern themselves rather with the internal and constitutional progress of England than with mere military events, except as the latter bear on the former, and are generally adapted not only to beginners, but also to busy men who desire to obtain or to recall a knowledge of those essential facts in English history without which no American rightly apprehends the history or even the political character of his own land.—Mr. JOHN M. GOULD's little book, *How to Camp Out* (Scribner, Armstrong, and Co.), is, first of all, of a size such that it can easily go in the overcoat pocket. The amateur can therefore carry it with him for ready reference. It wastes no words in eloquent descriptions of the glories of nature, the exhilaration which life in the woods affords, the health of out-of-door life, etc., but is wholly devoted to practical advice. It is a camp hand-book. In it the author tells us how to get ready, what we may take, what we must take, and what we must do without; how to pack and how to carry; what clothing to wear; what cooking utensils are needed, and how to use them; how to march with the least suffering and fatigue; how to select a camping ground, and how to put a camp on it; together with much miscellaneous advice, as on the care of lady companions, keeping a diary, treatment of special cases of accident and disease, and the like. The few simple illustrations help to make clear the author's meaning. He writes evidently from a large experience; his directions are sensible; he puts much wisdom in few words; and his book is to be cordially commended to all who are inclined to try practically the merits of this healthful and economical method of spending a summer's vacation.—J. W. BOUTON reproduces in this country, from the French, *Le Costume Historique*, a quarto containing five hundred pictures, three hundred in colors, gold and silver, two hundred in cameo. The illustrations are accompanied with brief explanatory matter. The range covered is very large, including all ancient as well as modern nations. Together with costumes are some rich interiors, and some illustrations of ancient manners and customs. The work is beautifully done; the printing in colors particularly is of a kind not to be seen outside of France. There is an accuracy of treatment and a delicacy of tone and of shading which give to the plates all the appearance of having been colored by hand. The pictures come in portfolios or loose sheets. Both to the artist and the antiquary the work will be one of peculiar attractiveness and value.

Mar's White Witch, by G. DOUGLAS (Harper and Brothers), is a story composed of somewhat common experiences, as is real life—love, falsehood, separation, reconciliation. But the common is not commonplace, and the story of Celia's love and hate, Captain Mar's love and jealousy, and Denis's love and trustfulness is so wrought out as to keep alive alternate emotions of indignation, of pity, of hope, of sorrow, in the mind of the reader. We may almost say that the story is simply one of love, and we suspect that the author's design, though it is successfully veiled in the dramatic play of the story, has been to show how love, working with various elements of character, and variously trained, directed, developed, may produce any experience, from hate to tenderness, from falsehood to fidelity, from misery the deep-

est to joy the most supreme.—*That Lass o' Lowrie's*, by FRANCES HODGSON BURNETT (Scribner, Armstrong, and Co.), is not written merely to entertain, and will not be read merely for entertainment. The scene is laid in a Lancashire mining town. The authoress writes in a hearty and genuine sympathy with the mining folk. Without losing any thing of her own delicacy and refinement, without blurring her pages with coarseness or vulgarity, she pictures graphically their rude life and its effect on character. She has given the dialect perfectly; the Scotch of Walter Scott is not a more faithful reproduction. Her Christian sympathies have taught her, and she teaches finely, how Christian work is to be carried on among a people hardened by toil and embittered by sorrow. The development of Joan from a rude but strong pit-girl to a noble type of womanhood is admirably effected without taxing the reader's credulity by violating the laws of human nature. The book is full of light and shade in the play of contrasted character—Joan and Liz, the self-denying curate and the self-satisfied rector, the "little parson" and the strong engineer. Mrs. Burnett, as those of our readers know who have read her short stories published in this Magazine, has the dramatist's power, and without inventing unnatural incidents, or even extraordinary situations, allows the life which she describes to tell its own story without interpretations or interpolations from herself.—Mr. W. H. H. MURRAY, in the *Adirondack Tales* (The Golden Rule Publishing Co.), has written a book so much in advance of his previous *Adventures in the Wilderness* that it is not easy to conceive it as emanating from the same hand. He takes us into the Adirondacks; he introduces us to a pure child of nature's school—a trapper whose God is the one whom the solitudes have taught him to adore, whose religion is one of reverence, of love, of purity of thought and life. He introduces us to nature herself, and with the enthusiasm of a true lover, sketches her in her various moods. To read this book is like spending a week in the wild itself. The "Story that the Keg told me" is thoroughly unique in conception. This ministry of nature to a miser's heart, and his conversion in God's first temple and through the unspoken word, may, perhaps, be accounted improbable by the theological critic, but it will not seem so to the imagination, whatever philosophy may say to it. The three characters in the second sketch are admirably set off against each other, and we hope we may meet again, in a story that shall be less of a sketch and more of a romance, Henry Herbert, John Norton, and "the man that didn't know much."—*Juliet's Guardian* (Harper and Brothers) is one of those English love stories which only English society could produce, but with which American novel-readers delight to harrow up their feelings.

The second volume of the *Life of the Prince Consort*, by THEODORE MARTIN (D. Appleton and Co.), carries the story of his life from 1848 to 1854. It will be of greater interest than the preceding volume to the student of political history, and of less interest to feminine readers; it is less taken up with the domestic life of the Prince and the Queen, and more with public affairs. The revolution in France, the threatening of socialistic difficulties in Germany, the Irish problem, the great Exhibition, the East-

ern question, the visit of Kossuth to England, are among the subjects with which the Prince concerned himself, and respecting which we get in this volume much information not to be found in ordinary histories.—We are glad to record the fact that Scribner, Armstrong, and Co. have published a new and cheaper edition of FORSYTH'S *Life of Cicero*, the two volumes in one. This is quite the best life of the great orator. The author, while an admirer of Cicero's genius, is not insensible to his faults; his work is neither a critique, a panegyric, nor an apology. His descriptions of ancient life are admirable both for accurate scholarship and for artistic excellence.

Dr. PHILIP SCHAFF'S *Creeds of Christendom* (Harper and Brothers) will be chiefly attractive and chiefly valuable to the professional student. Its bulk, if not its theme, will prevent it from finding many readers outside the range of ecclesiastical students. Yet it deserves to rank among the most important contributions of the age in the realm of ecclesiastical history, and its character should make it both interesting and valuable to all students of the development of religious thought. It consists of three volumes—the first a history of the creeds of Christendom, the two others a collection of those creeds, including all the important symbols of doctrine of the Romish, the Greek, and the various Reformed churches. Such a comprehensive survey of the creeds of Christendom has never before been attempted; such a library of creeds and confessions has never been published together. The creeds and confessions are given in the original languages, with translations for the convenience of the English reader.

Dr. Schaff begins his history with the Bible, and endeavors to make out a list of Scripture confessions; but these are for the most part only such individual utterances as those of Nathanael, Peter, and the eunuch, or such embodiments of doctrine as are found in single passages in the epistles. No one of them is emblazoned on the banner of a church, or made the condition precedent to admission into its communion; no one of them can be characterized as even intended as a summary of all important religious truth in a narrow compass. The earliest creed, as it is still the most sacred and the most catholic, is what is known as the Apostles' Creed. It derives its title from a curious but long since exploded legend, that it was composed by the apostles in Jerusalem on the day of Pentecost, each apostle contributing one declaration of doctrine. In fact, it was a growth of nearly five centuries, and not the least interesting and instructive part of Dr. Schaff's work is the tracing of this growth, in successive generations and through successive confessions, from the baptismal creed of Irenæus to the present and perfected form, which it did not reach till the close of the fifth century. The Apostles' Creed, the simplest of all doctrinal statements now extant, is really little more than a summary of the facts of Christ's life and death, and the most essential truths of his future re-appearing—truths held in common by all Christendom, papal and Protestant, orthodox and Unitarian. In this creed there is no attempt to formulate any statement respecting the Trinity—a simple faith in God the Father, in Christ as His Son, and in the Holy Ghost suffices; there is no attempt to define the doctrine of atonement—a confession of faith in the forgiveness of sins is all; there is no attempt

to express a conclusion respecting the doom of the wicked; and there is no hint of those damnable clauses which grew up in the later creeds out of bitter controversies. Meanwhile, however, the conflicts, in which the combatants did not confine themselves to the tongue as a weapon, respecting the character of Christ and the procession of the Holy Ghost, had given rise to the Nicene Creed, which is carefully drawn so as to exclude Arians from fellowship in the Church; then followed the Athanasian Creed, which adds to an incomprehensible definition of the Trinity the sanction of a declaration that no one can be saved who does not think according to its unthinkable propositions. Twelve centuries then passed away with no material addition to the formal creed—centuries of little real mental independence or mental activity. During those twelve centuries the doctrines of papal authority, the worship of the Virgin, the adoration of images, transubstantiation, purgatory, and penance all grew up in the Roman Church. But not until Luther, the reforming monk, began his attempt to cut off the dead wood from the tree, that it might bring forth fruit, was any endeavor made to incorporate the faith of the Romish Church in a formal creed; while this very endeavor, and its success in the decrees of the Council of Trent, gave rise in time to a resolute purpose by the reformers to define, with at least equal clearness, the points in which they differed from the Church at Rome. From this era spring all the modern creeds of Christendom. Every one of them was cradled in war, and bears marks of the battle. In every one the endeavor was, not to find a common ground on which all followers of Christ could stand, but to find an exclusive ground from which all followers of Christ whose philosophy was not in accord with the churches and theologians represented, could be fenced off. These creeds were made not as walls to keep off the wolves, but as fences to divide the sheep. They are all, to quote Dr. Schaff's words, "more or less directly or indirectly polemical against opposing error. Each symbol bears the impress of its age and the historical situation out of which it arose." Controversy produces keenness, but it does not produce breadth. The creeds of to-day are the births, for the most part, of the sixteenth and seventeenth centuries; they are clear, but they are narrow; exclusive rather than inclusive; dogmatic rather than experimental; the platforms of contending schools, not the declarations of a common Christian faith. The Church has since then more than gained in breadth what it has lost in acuteness; and not the least service which this library of creeds may be expected to render the Christian Church is that which it will render by teaching the truths that Christianity is more than any of its creeds; that the best creeds are but partial and often prejudiced representations of the truth, as held not in love, but in controversy; that the poorest creeds are partial though also prejudiced representations of truth; and that the whole truth is found only in a study and a combination of them all, as pure light by a combination in a single ray of all the colors of the spectrum.

Aids to Latin Orthography, by WILHELM BRAMBACH. Translated by W. GORDON M'CABE, A.M., Master of the University School, Petersburg, Virginia (Harper and Brothers, 1877). This admirable translation by Mr. M'Cabe of Brambach's

Hilfsbüchlein für lateinische Rechtschreibung supplies a want which must have been felt by all whose lot it is to correct Latin exercises. It gives the normal spelling, that is, the spelling which ought to be adopted by the writer of Latin in the nineteenth century, and which, therefore, every teacher must insist on requiring from his pupils.

The older editors of the Latin writers were generally contented with retaining in their editions the conventional spelling—in other words, the spelling of the transcribers of the Middle Ages; but all modern editors of classical texts make it their first endeavor to reproduce, as far as possible, the very words of their author, and the very form in which he wrote those words. Till we have ascertained, as accurately as may be, what the philosopher, or orator, or historian of antiquity did in fact write, all commentaries must be uncertain, all inferences dubious; and until we replace the spelling of each writer, as far as the hints of grammarians and the indications of manuscripts enable us to do so, we shall be unable to trace the development of forms or the series of changes in pronunciation which took place in the languages of the ancient world. We need not say how necessary a knowledge of such development and of such change is to every student of comparative philology. He has to work backward from a known present to an unknown and prehistoric past; he must trace the word which escapes so lightly to-day from the lips of us all back to its origin, and he can not so trace it unless the steps which it has taken from age to age are distinctly marked. A student of our own language now finds it absolutely necessary to have editions of English writers in the spelling sanctioned by themselves. The spelling of Shakespeare is a link in a chain which without it is imperfect; the spelling of Milton is not the mere vagary of a scribe or a printer, but the deliberate expression by one of the greatest scholars of his day as to the fitting forms of the words he employed.

But critical editions in seeking to give the texts of authors the proper form based upon the history of the language bring us face to face with the difficult question, What spelling ought to be adopted by the modern Latinist? Must we follow the spelling of Cicero and Cæsar, or of Livy and Virgil, or of Tacitus and Quintilian? Moreover, the ancients did not hesitate to use side by side different forms of a word, provided that these forms still held a place in living speech; and thus there arises the further question, Which of these contemporaneous forms is to be preferred?

Since the publication in 1868 of the *Neugestaltung der lateinischen Orthographie in ihrem Verhältniss zur Schule*, Brambach has been regarded, by the general consent of scholars, as the first authority on this special subject; and in 1872 he published the little work which Mr. M'Cabe has so excellently translated, and which is now given to the public in such an attractive guise. Mr. M'Cabe has by no means confined himself to a perfunctory discharge of the task of translator, for we observe, by a comparison of his translation with the original, that scores of erroneous citations in the original have been corrected, and the references to Neue's *Formenlehre* (vol. ii.) made to the new edition of that invaluable

work as far as it has appeared. With such a work within the reach of both teachers and pupils, there can no longer be any excuse for a continuance of the neglect which has been exhibited on this matter in too many of our schools. In Germany the subject has long had due attention paid to it, and the school-masters of England are working steadily in the same direction. The conventional spelling will be discarded in the new edition of Andrews's Latin Lexicon, and we therefore hope that orthography will no longer be ignored in our class-rooms. As a practical educator, Mr. McCabe has felt the want of such a manual as Brambach supplies in every school of Germany, and has succeeded in giving in English dress a work indispensable to every scholar.

Wit and Wisdom of the Haytiens, by JOHN BIGELOW (Scribner, Armstrong, and Co.). Those who read Mr. Bigelow's entertaining papers on this subject, published in this Magazine two years ago, will be glad to read them again in the dainty volume now offered to the public. During his residence in Hayti in 1854 the author made the intellectual capacity of the people a special study, and in this connection became especially interested in their proverbs, many of them of French origin, but a large and by far the most interesting portion indigenous. The subject is one well worth the attention which Mr. Bigelow has given it, and his own comments are as entertaining as his texts are pithy. The volume is a valuable contribution to American literature.

Editor's Scientific Record.

SUMMARY OF SCIENTIFIC PROGRESS.

Astronomy.—We have had to record the re-discovery of *Maia* (66), and by a similar process *Camilla* (107) has also been found. Schufler prepared an ephemeris from January 8 to February 25 from the various systems of elements heretofore determined. That the uncertainty of this was enormous may be seen from the fact that the R. A. on January 8 might have been between 7 h. 35 m. and 10 h. 29 m. The space to be examined was divided between Paris, Marseilles, Berlin, and Pola. On the 2d of March, Palisa, of Pola, after having mapped 2800 stars, detected the missing asteroid.

Comet *b*, 1877, was discovered by Winnecke at Strasburg on April 5, and has since been well observed. It was bright enough to be visible to the naked eye, and had a tail of one or two degrees, and structure was perceptible about the head. Young, of Dartmouth, reports its spectrum to be of the usual cometic type.

Comet *c*, 1877, was discovered by Swift, of Rochester, New York, April 11, at 9 h. 30 m., and the announcement was made to the observatory at Washington and to the Smithsonian Institution. Through some oversight, no telegraphic announcement was made to Europe, and Borelly independently discovered it on April 14. It is very faint.

Schmidt, of Athens, communicates to the *Astronomische Nachrichten* a long series of variable star observations made in 1876.

Burnham, of Chicago, has lately discovered some interesting doubles, among which we may cite L 22020, $p=60^\circ \pm$, $s=0.5''$, mags. 9, 9; O *Arg.* 11836, $p=80^\circ$, $s=1'' \pm$, mags. 8, 9; L 18231, $p=70^\circ$, $s=1.3''$, mags. 8.5, 10. These are remarkably difficult stars to be found with a six-inch aperture, and furnish renewed proofs of the excellence of the Clark telescope and of the observer's eye. Mr. Burnham also notes that 8 *Sextantis*=A. C. 5 is a *rapid* binary, having moved 130° since 1860.

From information received from Mr. H. C. Lewis, of Germantown, we learn that he continues to see the zodiacal light from horizon to horizon, and also that the veritable *Gegenschein*, as an oval spot of light in the zodiacal light, appears distinctly, and from month to month shifts its place in the stars so as to keep about opposite the sun.

Nature for April 12 contains an account of a

remarkably persistent parheliion seen in England; the opposition of Mars (1892); notes on comets, etc.

Proctor publishes an article on the movement of the cloud masses on Jupiter, in the *Quarterly Journal of Science* for April.

The *Monthly Notices* of the Royal Astronomical Society for March contains papers by Stone, of Cape of Good Hope, on apparent brightness of stars as an indication of their distance; Newcomb, of Washington, on the phenomena of contacts of transits of Venus; Marth, ephemeris for physical observations of Jupiter; Hind, on two ancient (Chinese) occultations of planets; Neison, on lunar perturbations produced by Jupiter; Tupman, on corrections to nautical almanac places of the moon, in which the observations of several observatories for six months are examined, and do not show any trace of the new lunar inequality; Arcimis, of Cadiz, on visibility of Venus's dark limb, etc.; Gasparis, of Naples, on Kepler's problem; Ball, of Dublin, on a transformation of Lagrange's equations of motion, with additions by Cayley; Abney, on the rotation of stars; Birmingham, on V *Geminorum*; and Burnham, on H. I. 62 (double-star).

We note the establishment of a new astronomical periodical (monthly), under the editorship of Mr. Christie, first assistant at the Royal Observatory, Greenwich. He is to be assisted by several eminent astronomers. The first number appears on April 20, 1877, under the name, *The Observatory: a Monthly Review of Astronomy*, and contains articles by Huggins, Gill, Darwin (G. H.), Birmingham, Tupman, Brett, and Marth. There is undoubtedly a field for a good journal of this class.

The semi-annual meeting of the National Academy of Sciences took place at Washington during April. Important astronomical papers were read by Young, on a new clock escapement; Pickering, on standard declinations; Langley, on solar spectroscopy; Barnard (J. G.), on precession, etc.; Newcomb, on the lunar theory; Hill, also on the lunar theory. Abstracts of these will be given on their publication.

Major Twining, assisted by Captain Gregory and Lieutenants Greene and Quinn, of the United States Engineer Corps, has just remeasured the whole line of the Pacific railways, and his report

gives interesting data as to the accuracy of chaining, odometer measures, etc. It is printed by order of the Secretary of War.

The death of Dr. Bremiker, at Berlin, on March 26, is a great loss to astronomical and particularly to geodetical science. Dr. Bremiker became early known as the maker of one of the Berlin star charts (by means of which Neptune was found), and since he has constantly been active in astronomy and geodesy. He also has for many years conducted the Nautical Almanac of Germany. The scientific world owes him a debt of gratitude for the extremely valuable series of mathematical tables prepared by him, and now widely current.

In *Physics*, we have to note a paper by Wand on the propagation of electricity in cylindrical conductors, which is an extended mathematical discussion of the whole subject. He finds (1) that the character of the propagation of electric disturbances of equilibrium is different according as the resistances to be overcome are small or great; (2) that with small resistances—such as that of 120 to 400 kilometers of copper wire 2 millimeters in diameter—restoration of the equilibrium takes place by oscillations, the amplitude of which diminishes the more rapidly the greater the resistance; (3) that with great resistances—such as 1000 kilometers of the above wire—no oscillations are observed, the velocity being inversely proportional to the total resistance and to the length of the conductor, and hence, for two conductors of equal specific resistance, being inversely as the square of the length; and (4) that the velocity of electric signals magnetically produced is not, except in cases where the resistance is very large, comparable with that of disturbances of electrical equilibrium, the latter being the greater. One curious result the author draws from his investigation, *i. e.*, that when the resistance in the circuit is very small, the motion of the electricity takes place almost exclusively upon the outer surface of the conductor.

Baxendell has called attention to the fact that the system of protecting buildings from lightning which Professor Maxwell presented at the Glasgow meeting of the British Association was suggested by the late Mr. Sturgeon in a paper read before the London Electrical Society on March 7, 1838. Mr. Sturgeon, moreover, advocated an efficient earth connection—a measure absolutely essential to prevent damage should the building be struck by lightning.

Wright has studied the production of transparent metallic films by the electric discharge in exhausted tubes, and has obtained some curious results. The colors obtained by transmitted light were, for gold, brilliant green, thinning out to pinkish-violet; for silver, pure deep blue; copper, dull green; bismuth, grayish-blue; platinum, gray; palladium, smoky brown; lead, olive brown; zinc and cadmium, grayish-blue, inclining to purple; aluminum, brownish; iron, neutral tint; nickel and cobalt, gray or brownish-gray; tellurium, purple; magnetite, gray-brown. The light transmitted is powerfully polarized, the polarization increasing with the incident angle. The metals of high atomic weight volatilize most readily.

Barat proposes to use, for the Franklin portrait experiment, in place of a gold leaf, a gilded plate of glass, having two strips of tin-foil across the ends and the portrait outline, paper and press

as usual. One spark is sufficient; a second uniformly breaks the apparatus.

Berthelot, having proved that even under the ordinary electric tension of the atmosphere a silent discharge may be caused in a tube containing nitrogen, by means of which this gas may be absorbed by organic bodies to form new compounds, proposes this result as one which must necessarily go on in nature. Hence he insists upon the necessity of studying consecutively and methodically the electric condition of the atmosphere, since upon its tension this absorption of nitrogen depends.

Streintz has described a new form of Noë's thermo battery, and has given the results of some measurements with it. The positive metal consists of an alloy of 62.5 antimony and 36.5 zinc, and the negative metal of German silver wire. The battery contained four series of 27 elements each, so arranged as to be combined in two series or in one only. The electro-motive force estimated by Fechner's method was that of 4.3 Daniell cells; the resistance, 2.7 Siemens units.

Naccari and Bellati have investigated the thermoelectric properties of potassium and of sodium at various temperatures, using pairs formed by one of these metals and copper in the earlier experiments, and lead in the later. The results show that the passage of a unit of electricity from a cold section to another warmer by one degree, transports, following the direction of propagation of the negative fluid, a quantity of heat equivalent respectively to 2529 units of work for the potassium and 4129 units for the sodium. The neutral points are at -62.04° and -212.4° .

Gauduin and Gramme have experimented to determine the effect of the introduction of various more or less difficultly fusible substances into the carbons employed for the electric light in increasing the brightness of the arc. The substances used were bone ash, calcium chloride, borate and silicate, silica, magnesia, magnesium borate and phosphate, alumina, and aluminum silicate. The proportions were so regulated that, when burned, the carbons should contain about five per cent. of the foreign substance. The results show that only with the bone ash was the light increased measurably, but that the fumes produced are serious objections to the use even of this.

Spottiswoode has described the new enormous induction coil made for him by Apps, which is capable of giving sparks 42 inches long. It has two primary coils—one used for long sparks, the wire being 660 yards long and 0.096 inch diameter; the other, for fat sparks, has 84 pounds of wire, instead of 67. The secondary wire is 280 miles long, and forms 341,850 turns. In the two central sections the diameter of this wire is 0.0095 inch, and in the two outer ones 0.0115 and 0.0110 inch. The condenser consists of 126 sheets of tin-foil 18 by 8.5 inches, separated by two thicknesses of varnished paper 0.0055 inch thick. Glass 3 inches thick has been pierced with the 28-inch spark of this coil, using 5 cells of Grove.

In *Chemistry*, we note the discovery, by Johnson, of potassium tri-iodide, by evaporating over sulphuric acid a saturated solution of iodine in potassium iodide. At first dark-colored cubical crystals of the iodide, colored by iodine, were deposited; but in a few days lustrous dark blue prismatic crystals, sometimes two inches long, separated, which had the composition of the tri-iodide,

and were extremely deliquescent. Their specific gravity was 3.498.

Fairley has studied the action of various bodies on hydrogen dioxide, with a view to determine the cause of the decomposing action they exert. In the case of the metals—silver, for example—he believes that there is first an oxidation, and then a reduction again, due to the reaction of the silver oxide upon the hydrogen dioxide.

Berthelot several years ago discovered a new complex sugar in the Briançon manna, an exudation from the larch, to which he gave the name of melezitose. Villiers has now identified with this a sugar obtained from Lahore, and there known as turanjbin, being an exudation from *Albaji maumorum*, a spiny bush belonging to the leguminosæ.

Vincent has examined the products obtained by the dry distillation, in close vessels, of the residue left after fermenting beet-root molasses, called vinasse. He has identified methylamine, methyl alcohol, sulphide and cyanide, hydrocyanic acid, formic, acetic, propionic, butyric, valeric, and caproic acid; phenol, and a series of liquid bases.

Cloëz has detected copper in the blood of two male deer killed wild in the woods. In the first case no special precautions were taken, but in the second the process was conducted with the greatest care, and three milligrams of copper oxide were obtained from 530 grams of blood. In the opinion of the author, the question of its origin is an interesting one, since the metal could have come only from the vegetables eaten or the water drunk by the animal.

Radziszewski has observed that light is emitted when certain aldehydes in alcoholic solution are agitated with potassium hydrate. He suggests that the phosphorescence of marine animals may be due to the formic aldehyde they excrete, which, oxidizing to formic acid, produces the sensation of stinging which they exhibit.

Mineralogy.—Professor Weisbach, who has already described several new uranium minerals, has added recently still another to the list. This he calls *uranocircite*; it occurs in quartz veins in the granite of the Saxon Voigtland, near Falkenstein. In appearance it resembles closely the well-known uranium-mica (autunite), but in composition it is a hydro-phosphate of barium; its specific gravity (3.53), too, is considerably higher than that of autunite (3.1), corresponding to the amount of barium present.

Professor Weisbach has also discovered a new member of the calcite group of rhombohedral carbonates, to which he gives the name *sphaerocobaltite*. It is chemically a protocarbonate of cobalt, and occurs in spherical forms, which are aggregations of minute rhombohedral crystals. It has a deep red color and a red streak, and has the hardness of fluorite. It is found with the rare mineral roselite at Schneeberg, Saxony.

Sonomaite is a name given by Mr. E. Goldsmith to a mineral collected by Professor Hayden near the geysers in Sonoma, California. It is a hydrous sulphate of aluminum and magnesium, and occurs in silky, colorless crystals.

Hydrocastorite is a new mineral from Elba. It occurs in white, mealy masses with beryl, tourmaline, and castorite. It is often found enveloping the grains of castorite, and has evidently been produced by its decomposition. Under the microscope it is seen to be made up of minute pris-

matic crystals; in composition it is a hydrous silicate of aluminum and calcium.

Venerite has been described by Dr. T. Sterry Hunt. It is chemically a copper chlorite. It is found in a more or less impure state at the Jones Mine, near Springfield, Berks County, Pennsylvania, and has been mined as a copper ore for several years; in fact, its metallurgical value gives it its especial interest. It forms irregular layers interstratified with the soft schists. The purest portions have a pea-green color when moist, but are greenish-white on drying, when the mass falls into a powder, which is seen under the microscope to consist of minute transparent scales. A very large amount of this mineral has been already subjected to metallurgical processes.

Microscopy.—Dr. Tyndall has recently repeated at Kew, where he found a purer atmosphere than at the Royal Institution, his last year's experiments, with perfect success, and without the annoying failures due to the atmosphere of the Institution being laden with germs from a quantity of hay, and has thus once more proved his case against Dr. Bastian. In every experiment but one the specimens showed no trace of life; in that one a small aperture like a pin-hole was in the side of the test-tube. Dr. Tyndall's paper is published in the Proceedings of the Royal Society (No. 176).

In the April number of the *Monthly Microscopical Journal* Rev. S. G. Osborne describes a modification of Reade's "kettle-drum" illuminator, under the novel name of the "Exhibitor." Like most other devices of this class, the practice and patience required to master it will more than counterbalance its advantages, if, indeed, it really has any over the simpler and easier modes of illumination.

In the same journal is an interesting paper, by Professor Giovanni Briosi, of Palermo, on the *phytoptus* of the vine. This disease, producing protuberances, or *cecidii*, on the leaves, oftentimes numerous and confluent, and in fact covering the whole leaf, convex on the upper and concave on the under side of the leaves, is due to punctures and irritation produced in the texture by the *acari*, which lodge in the *cecidium* and live on the leaf. The *acari* were termed *phytoptus*, to express that they are really and solely parasites of living plants; they are invisible to the naked eye, and the male can not be distinguished from the female with certainty; they have but four legs, though Landois supposed that there were two other (rudimentary) pairs, and that in their complete development they possessed four pairs of legs, like other *acari*. Professor Briosi considers that Landois is mistaken, and that these animals constitute a special genus of *acari*, which have only four legs. These *arachnida* possess a most extraordinary tenacity of life, moving the legs twenty-four hours after immersion in glycerine. In the autumn they emigrate from the leaves to nestle under the bracts which cover the winter buds, and they have been found alive in buds which had been exposed shortly before to a cold of -10° F. In the spring, with the swelling of the buds, the animals regain their activity, and lay eggs, which are deposited directly on the young leaves of the developing bud, and the young ones are scarcely born when they find already within reach the food which nourishes them; and the galls, or *cecidii*, appear under the form of small

spots, scarcely raised, and of a slightly different color from the rest of the leaf, but readily seen by allowing the sunlight to shine through. Repeated careful pruning of the stems which showed the disease the preceding summer, and cutting off the attacked leaves, will, in Professor Briosi's opinion, in a few years result in the destruction of this unwelcome visitor.

In the *American Journal of Microscopy* for April the well-known optician Mr. E. Gundlach describes two new illuminating glasses for the microscope. One is a hemispherical lens, which is connected to the object slide by a drop of water or glycerine, and of such thickness that the converging rays from the mirror undergo no refraction at the first or convex surface, but on emerging from the plane surface, or, better, the glycerine, are powerfully refracted, but almost without aberration, as the centre of the curve is in the optical axis of the microscope, and the object itself is very nearly in the centre of curvature. The other is an oblique light-projector, distinguished from the condenser by the fact of the lower surface being plane instead of convex, and parallel with the upper one.

At a recent meeting of the Academy of Natural Sciences, at Philadelphia, Professor Leidy explained a seeming phosphorescence of the water observed in cloudy afternoons as due to the reflection of light from minute mirror-like appendages of small crustaceans. He also exhibited a tape-worm said to have been taken from the inside of a large cucumber!

Reasoning on certain data more or less theoretical, mathematicians of the first order, notably Helmholtz, had concluded that the limit of vision had been reached, that the optician could practically aid us no further—that, in short, the limits of possibility had been arrived at, since light itself is too coarse to reveal objects smaller than those visible to our finest and most powerful lenses. The limit marked out was about the one-hundred-and-eighty-thousandth of an inch. Recently the Rev. Mr. Dallinger, in a note read before the Liverpool Microscopical Society, gave instances of a remarkable kind, the result of his personal investigation, directed specially to this point, which were proved, by a method of measurement employed specially for the purpose, to carry the power of our most delicately constructed lenses considerably further than the mathematician considered possible, revealing, indeed, smaller objects than those mathematically indicated; and Mr. Dallinger did not, by any means, believe that he had wholly exhausted the power of visibility by these experiments.

Anthropology.—In the March and April numbers of the *Semi-Tropical*, published at Jacksonville, Florida, Dr. Frederick D. Lente publishes two articles on "The Mounds of Florida." The explorations were made in the vicinity of Palatka, and yielded important results. The purpose of the author, even more commendable than his results, is "to impress on the minds of invalids and tourists coming to Florida the importance of devising some means of insuring both physical and mental employment."

The first number of Volume III. of the Bulletin of the United States Geological Survey of the Territories contains four very interesting papers—two by Schumacher, upon the shell-heaps and graves of Oregon and Southern California; one

by Eells, on the Twana Indians; and one by Lieutenant-Colonel Garrick Mallery, on a calendar of the Dakota nation. This very interesting object is a group of paintings on a buffalo-robe. Beginning at the centre, a series of rude pictures of objects known to the Dakotas, and arranged in a spiral, represents the consecutive years from 1799 to 1871. This calendar is the work of Lone Dog, who was deputed by his tribe to select some event in their history characteristic of each year, and to represent it on the calendar robe by an appropriate symbol.

In *Matériaux* for 1877, No. 2, L. Pigorini reviews the opinions commonly held concerning the wrought stags' horns, called "batons of command." The author thinks that the prehistoric man used them in connection with horse trappings. In Scandinavia at the present time a portion of the headstall of bridles is made of horns similarly wrought.

Those who visited the Government Building at the Centennial Exhibition were struck with the anthropological display of the National Museum, under the direction of Dr. Charles Rau. The French anthropologists have already organized their corps of *savants* to make a fine display at the Exposition of 1878. The collection will be called "A historical exhibition of ancient art in all countries, and of the ethnography of peoples foreign to France."

Mr. Francis Galton delivered a lecture at the Royal Institution of London, Friday, February 9, on "Typical Laws of Heredity." The object of the lecture was to draw attention to the interesting fact that while groups of beings tend to preserve their average dimensions, individuals follow no such law, giants very seldom begetting giants, and children seldom observing the dimensions of their parents, especially if they depart from the average. The lecture, reported in *Nature*, April 5, 12, and 19, was very ingeniously illustrated by dotted diagrams.

The first number of Petermann's *Mittheilungen* for the current year contains an interesting *résumé* of the Russian people. A finely executed colored chart accompanies the number, giving the various stocks—Lithuanians, Slaves, Germans, Greco-Roumanians, Iranians, Iberians, Caucasians, Finns, Turks, Mongolians, etc.—in a very graphic manner.

Mr. Murray, of London, will soon publish General Di Cesnola's work descriptive of his discoveries. It will also contain a history of the archæology of Cyprus, by the author, and a paper on the gems discovered at Kurium, by Mr. C. W. King.

Mr. William Tegg, the author of a work on the history of the burial of the dead, entitled *The Last Act*, has just issued a work entitled *Meetings and Greetings: the Salutations, Obeisances, and Courtesies of all Nations, etc.*

The map of prehistoric France accompanying the *Nouvelle Géographie Universelle* of M. Elisée Reclus locates 396 prehistoric sites of paleolithic times. The neolithic localities comprise 26 natural caverns, 144 artificial caverns, and 2314 dolmens.

Zoology.—Among the lower animals the *Protozoa* claim much attention. The foraminiferous forms—shall we say *varieties* or *species*?—of Barbadoes have been studied by Van den Broeck. His material was received from the West Indies, having been collected by the late Professor Agassiz. He concludes, with all others who have

studied these exceedingly variable forms, "that the terms genus, species, variety, have a very different and broader acceptation than we usually suppose."

A number of new Caribbean sponges are described in the *Annals and Magazine of Natural History*, by Thomas Higgin.

In a recent lecture on the forms of passage between the annelids and mollusks, Professor Perrier seems to adopt the idea, already suggested by two or three naturalists, that the mollusks are in reality, to use Perrier's own words, "worms condensed into two or three segments." Is this the beginning of the end, and are we finally to regard the mollusks as originally descended from worm-like forms, and therefore as not forming a distinct sub-kingdom of animals?

The anatomy of the common mussel (*Mytilus edulis*) is elaborately treated by A. Sabatier in the *Annales des Sciences Naturelles*. The essay fills 132 pages, and is illustrated by nine folding plates.

The external anatomy of a shelled phyllopod (*Estheria californica*, Pack.) forms the subject of an essay by Dr. H. Lenz. A number of new North American phyllopod crustaceans are described by Packard in Hayden's Bulletin of the United States Geological Survey (Vol. III., No. 1). It appears that the genus *Lepidurus* is better represented in Western and Arctic North America than in any other part of the world so far as known, there being two Western American and one Arctic American species. No species of *Apus* or *Lepidurus* occurs east of the Mississippi Valley, and all these phyllopods occur mostly in the Western States. Several new entomostracous crustaceans from Colorado are described by Mr. V. T. Chambers in the same Bulletin.

M. Mégnin has studied certain mites (*Kytodites glaber*, Mégnin) which live in the air-sacs and cellular tissue of birds. They are of two kinds, one of perfect form (*Sarcoptes cisticola*), the others vermiform, which are the pupæ of an external mite (*Pterolichus falcigerus*, Mégnin). The subcutaneous life of this form tends to preserve the species from complete annihilation resulting from the casting of the feathers between the quills on which the normal form of this mite lives.

An important paper by Professor Plateau on the phenomena of digestion in the harvestmen (*Phalangium*) brings out the fact that the so-called liver of these animals, as well as of spiders and crustacea, is nothing else than the organ of secretion of a digestive fluid intended for the emulsifying of grease and the dissolving of albuminoid substances.

Professor Perez has studied the vitellogene cells of the ovaries of insects which give nourishment to the true egg cells of insects, as in certain crustacea (*Revue Scientifique*, p. 1001).

A new cave-fauna, entirely distinct from that inhabiting Mammoth and other caverns in Kentucky, Indiana, and Virginia, has been discovered by Dr. Packard on the shores of the Great Salt Lake. The different species of animals (a helix, myriapod, harvestman, and poduran) inhabiting the cave are described in Hayden's Bulletin.

Professor C. V. Riley's ninth report on the injurious insects of Missouri contains new and fresh information regarding the Western locust, the Colorado potato beetle, with maps illustrating

their extension East. Other injurious insects are more or less fully treated.

The United States Entomological Commission, having for its object the study of the habits, ravages, and best means of destroying the Western locust, is fairly at work. Circulars asking for information and returns, and two numbers of a bulletin giving timely information to farmers and others regarding its habits, so far as known, and remedies against its ravages, have been issued. The locust area, or nearly all the United States west of the meridian of 94°, has been divided into three departments, each to be visited personally by a member of the commission, which consists of C. V. Riley, A. S. Packard, Jun., and Cyrus Thomas.

The fishes collected by Captain Feilden during the last arctic expedition have been reported upon by Dr. Günther. Among them were several of great interest, especially a new species of char, for which the name *Salmo arcturus* was proposed. This char was discovered in the fresh-water lakes of Grinnell Land, and was stated to be the most Northern fresh-water fish known to exist.

A revision of the fresh-water fishes of Northern Indiana, with descriptions of several new forms, by Professor D. S. Jordan, appears in the proceedings of the Academy of Natural Sciences of Philadelphia. This paper is followed by an essay "On the Genera of North American Fresh-water Fishes," by D. S. Jordan and C. H. Gilbert. The catalogue comprises 225 names of genera and subgenera, "whereof about 128 seem to be entitled to generic rank, and the remaining 97 are either synonyms, or else entitled to use only as designations for sections and subgenera in works where the recognition of such groups by name seems desirable."

Dr. Günther has lately described two large fossil lizards, formerly inhabiting the Mascarene Islands.

Some notes on the distributions of birds in North Russia, by J. A. H. Brown, appear in the *Annals and Magazine of Natural History*, while an interesting lecture on the wolf origin of the dog, with a number of valuable illustrations, has been lately delivered by L. H. Jeitteles, before the Society for the Diffusion of Science in Vienna.

The *Popular Science Review* (London) contains an interesting article on the migration of the Norway lemming, by W. D. Crotch. The paper is accompanied by excellent illustrations.

In *Botany*, we have to report a paper on the *Pithophoraceæ*, an order separated from the *Cladophoræ*, by Dr. Veit Wittrock. In the *Botanische Zeitung* Dr. Robert Caspary describes a new species of *Nymphæa*, *N. zanzibarensis*, and gives a synopsis of the species of the genus found in Tropical Africa. In the same journal Dr. Nowakowski gives an account of some new species of *Entomophthora*, found by himself at Warsaw. In Pringsheim's *Jahrbücher* is an important article by the editor on the formation of buds from the fruit of mosses, followed by remarks on the alternation of generations in thallophytes. In the same journal Dr. Celakovsky has an article on the "Morphological Significance of Stamens," illustrated by several plates of monstrous formations of those organs. At the American Academy of Arts and Sciences, Professor Asa Gray read a paper on the germination of the seeds of

Megarrhiza californica, in which the primary axis of the plant seems to be a growth from the root-stock itself, rather than to arise from the ordinary development of the plumule.

Botanical science has suffered a severe loss in the death of Professor Alexander Braun, of Berlin. He was in his seventy-second year, and had only a short time before received the honorary title of Geheimrath.

Agricultural Science.—Messrs. Ballart and Comstock report some determinations of the amounts of nitrogen compounds in snow, conducted under the direction of Professor Perkins, of Union College. The proportions of ammonia and organic nitrogen were estimated in three samples each of freshly fallen and old snow. The three samples of fresh snow gave, on the average, in 100,000 parts by weight, 0.0465 part of ammonia, and 0.041 part of organic nitrogen. "With these values," say the authors, "calculating the total amount of ammonia and of organic nitrogen to the acre for each inch of water (that is, melted snow), we find it to be—ammonia, 0.1055 pound; organic nitrogen, 0.093 pound."

Using as a basis the observations at the Dudley Observatory, according to which the total snow-fall last winter (November 1, 1876, to March 31, 1877) was five feet eight inches, and reckoning ten inches of snow equal to one inch of water, the authors calculate that in this winter's snow-fall "there could not have been more than 0.69419 pound of ammonia and 0.61194 pound of organic nitrogen to the acre. This shows that though snow may be a great protective to the ground, still it does not act as a very powerful or rich manure."

The annual report of the New Jersey Board of Agriculture for 1876 devotes some eighty-four pages to a description of the geological characteristics, chemical composition, and agricultural uses of the marls of that State. The general conclusions as to the agricultural value of the greensand marls, which are the most important, are, in substance, that those which contain the largest percentage of phosphoric acid are the most valuable; that those which are rich in carbonate of lime are the most durable; that the potash in them has but very little, if any, present value, it being combined with silica, and hence insoluble; that the greensands containing but little of either phosphoric acid or carbonate of lime become active fertilizers when composted with quicklime; that the injurious effect of sulphate of iron in the marls can be counteracted by composting with lime; that the crops particularly improved by them are, all forage crops (grass, clover, etc.), potatoes, buckwheat, wheat, rye, oats, and corn. The tertiary and calcareous marls seem to be very useful, but less so than the greensand.

The fourth annual report of Professor Goessmann, State Inspector of Fertilizers of Massachusetts, has appeared in the annual report of the secretary of the Massachusetts Board of Agriculture, and in the form of a special pamphlet of some 42 pages. Besides accounts of analyses of the common commercial fertilizers—guano, superphosphates, bone-dust, potash salts, etc.—it gives analyses of a number of waste products of value as fertilizers, and is replete with interesting and valuable matter.

The Legislature of North Carolina has passed a bill providing for the organization of a Department of Agriculture, one of whose functions is to

be the establishment of an agricultural experiment station. Dr. C. Ledebau has been appointed director of the station, and work is to begin soon.

The organization of new experiment stations in Europe is going on rapidly. Among them we note one for wine culture at Würzburg, one for garden culture at Potsdam, and, finally, one for general work in agricultural chemistry at Florida, in the southern part of Spain. Portugal, Turkey, and Greece are now the only European countries without agricultural experiment stations.

Engineering and Mechanics.—One of the most practical attempts at the solution of the problem of introducing steam-cars on city passenger railways was inaugurated during the month of March by the Market Street Passenger Railway Co. of Philadelphia. This company placed seven steam-cars (or dummies, as they are popularly called) on its road on March 21, for the purpose of giving them a thorough and continuous practical test. One of these was built by the Baldwin Works, of Philadelphia, and the other six by Messrs. Gilbert, Bush, and Co., of New York. The experiment appears to have proved very satisfactory, all the cars having continued in operation since they were put on, without accident or objection. The cars are quite noiseless, and, save an occasional puff from the stack, no smoke or steam is visible in their performance.

The following extracts from the sixth report of General Comstock, the government engineer charged with the inspection of the progress of the works for the improvement of the South Pass of the Mississippi River, will be found of interest, as indicating the present condition of these important works. At the mouth of the South Pass, between November 18, 1876, and March 16, 1877, a few new wing dams have been built and some old ones repaired. About 16,000 cubic yards of material have been dredged out at points where the channel was worst. A storm December 30, 1876, damaged the ends of the jetties and the wing dams near them quite severely. Twenty-six thousand feet of the west jetty have been raised by mattresses two or three feet thick, built in place. But little work has been done on the east jetty. The channel, of twenty feet in depth at the mouth of South Pass, which, on December 27, 1876, had a width of 200 feet from the Pass of the Gulf, has narrowed at a point near the sea end of the jetties so as to be but 70 feet in width, and at a point a little below the head of the west jetty so as to be 180 feet in width.

From abroad we glean that the project for tunneling the Simplon Pass is gradually assuming a definitive shape. It appears that a French company, having secured important concessions from the Italian government, is seriously contemplating the undertaking. The projected line of road will commence at Brigue, which will thus become the international station to enter the tunnel, which, as projected, will have a length of 18,340 meters. The end of the tunnel will be near D'Isella, and the line is to proceed thence to Bombo d'Assola. The total length of the line will be 46,900 meters.

The *Iron Age*, in a report upon the condition of the blast-furnaces of the United States on April 1, announces that there were at the date above named fifty-seven charcoal, eighty-two anthracite, and seventy-nine bituminous furnaces in blast, showing a reduction since January 1 of twenty-six furnaces.

Editor's Historical Record.

POLITICAL.

OUR Record is closed on the 22d of May.—The President, by advice of his cabinet, issued a proclamation, May 5, calling for an extra session of Congress on October 15.

Governor Robinson, May 8, vetoed the bill passed by the New York Legislature allowing women to hold office on school boards.

The entire Crazy Horse band of Indians, numbering 900, surrendered at the Red Cloud Agency, May 6.

The French Chamber of Deputies, May 15, voted to repeal the Press Law of 1875. President M'Mahon wrote immediately to M. Jules Simon, the leader of the ministry, expressing surprise that neither he nor M. Martel, the Minister of Justice, had placed before the Chamber reasons which might have prevented the repeal of this law. The President also complained that the Chamber had during its last few sittings discussed the whole municipal law, and had even adopted some clauses the danger of which M. Simon had himself acknowledged in council (as, for instance, the publicity of sittings of municipal councils), without M. Simon taking any part in the discussions. The letter concluded as follows: "In view of such attitude on the part of the head of the cabinet, the question arises whether he retains sufficient influence to assert his views successfully. An explanation on this point is indispensable; for I myself, although not, like you, answerable to Parliament, have a responsibility toward France which to-day more than ever before must engross my attention." On the 16th, after an interview with the President, M. Simon resigned his position, and a dissolution of the entire cabinet followed. A general meeting of all sections of the Left ensued, 290 members being present. A resolution was unanimously adopted declaring that no cabinet can have the confidence of the Chamber which is not free in its action, and resolved to govern according to republican principles, which alone can secure order and prosperity at home and peace abroad. This resolution was adopted by the Chamber, May 17, by a vote of 355 against 154. On the 18th, the cabinet was reconstituted as follows: Duc de Broglie, President of the Council and Minister of Justice; M. De Fourtou, Minister of the Interior; M. Eugène Caillaux, Minister of Finance; M. Auguste Paris, Minister of Public Works; Vicomte de Meaux, Minister of Agriculture; M. Brunet, Minister of Public Instruction; General Berthaut, Minister of War. The Duc Decazes remains Minister of Foreign Affairs. Of these ministers, M. Brunet is the only republican. During the afternoon of the 18th, a message from President M'Mahon was read in both Chambers, inviting them to suspend their sittings one month. The President explained that while scrupulously conforming to the policy of the constitutional Dufaure and Simon cabinets, he could not take a step further in that direction without making an appeal to the radical factions which desire modifications of French institutions. The triumph of these ideas could only result in disorder and in the humiliation of France. He declared that he would repress any imprudent utterances by the press.

The change in the French government is con-

sidered in Germany a triumph of the ultramontane party, and that nation is strengthening the defenses of her western frontier.

The war between Russia and Turkey has as yet resulted in no very important engagement. While the Russians are upon the line of the Danube in great force, there has been no development of their plan for the European campaign. In Asia greater progress has been made. On the 11th of May the Russians attacked the van-guard of the Turkish army at Batum, on the eastern shore of the Black Sea, but were compelled to retire with heavy loss. On the 18th, an unsuccessful assault was made on the outer works of the fortress of Kars; but the same day they succeeded in capturing Ardaban, an important city between Batum and Kars. The government of Roumania has formally asserted its independence of Turkey, and has declared war against her.

The British House of Commons, May 13, rejected Mr. Gladstone's anti-Turkish resolutions by a vote of 354 to 223, and adopted without a division Sir Henry Wolff's amendment, to the effect that the House declines to entertain any resolution which may embarrass the government in its maintenance of peace and the protection of British interests, without indicating any alternative line of policy. In the course of the debate the following distinct declaration was elicited from the Home Secretary: "We should protect the Suez Canal, guard Egypt, and not permit any power to interfere with the freedom of the Dardanelles and the Bosphorus. Hence we should protect Constantinople from becoming the prize of conquest."

DISASTERS.

May 9.—Fire-damp explosion at the Wadesville Shaft Colliery of the Philadelphia and Reading Coal and Iron Company. Seven lives lost.

May 11.—The dome of the Winnebago County Court-house, Rockford, Illinois, gave way. Ten lives lost.

May 3.—Land-slide in the parish of Ste. Geneviève, Canada. Ten persons buried alive.

May 10.—Destruction of Iquique, Peru, by earthquake. The town had a population of 1000.

OBITUARY.

April 28.—At Bloomfield, New Jersey, Edward Seymour, of the firm of Scribner, Armstrong, and Co., aged forty-two years.

April 29.—At Knoxville, Tennessee, the Hon. William G. Brownlow, aged seventy-two years.

May 2.—In Mobile, Alabama, Colonel John Forsyth, editor of the *Mobile Register*, aged sixty-six years.

May 9.—At New Bedford, Massachusetts, Commodore Benjamin J. Totten, United States navy, aged seventy-one years.

May 11.—At Schenectady, New York, the Rev. Taylor Lewis, D.D., LL.D., aged seventy-five years.

May 16.—At Shrewsbury, New Jersey, Commodore Edward W. Carpender, United States navy, aged eighty years.

May 13.—Announcement of the death, in France, of Louis Joseph Ernest Picard, the distinguished advocate and statesman, aged fifty-six years.

Editor's Drawer.

AWAY back in 1864, Mr. John Woods, of Calaway County, Missouri, went out to try his fortunes in Montana, taking with him old Sam, one of the darkies who had grown up on the home place. Sam had for years, even before he was free, had pretty much his own way, and was well known as a sensible and witty fellow. In Montana he picked up odd jobs, and was in constant requisition. He was one day employed by a Yankee carpenter to hew a log for him, and having completed the job, went to the "boss" for his pay, expecting to charge about seventy-five cents. Meantime the carpenter had made a rough coffin for a poor fellow who had died in the wilderness, and at the time of Sam's call a friend of the deceased was paying for the coffin, the amount being sixty dollars. Turning to Sam, the carpenter, in his quick, snappy way, asked,

"Got that log done?"

"Y-y-es, b-b-boss, all d-d-done."

"Well, how much is it?"

"F-f-four d-d-dollars an' a half."

"Gracious! Why, you'd skin a man alive!"

"Y-y-es, boss; but dat's not as b-b-bad as skin him after he's d-d-dead."

OLD bachelors will read with subdued joy the following epitaph on one of their order, written by himself:

At threescore winters' end I died,
A cheerless being, sole and sad;
The nuptial knot I never tied,
And wished my father never had.

ONE Mr. Murphy has a store and residence under one roof in Rochester. There was a fire on the premises, to the extinction of which and the removal of the household goods some friends who were junketing with him, and certain Irish laborers, casually at hand, contributed. The fire was trivial, and soon over. Mr. Murphy gathered his friends around him, closed the doors, and quickly, under the inspiring influence of a liberal brewing of punch, forgot all about the humbler friends who had come to his aid, and who, in the cold without, listened longingly to the revel within. Presently a knock at the door. It opened, and these words entered: "Mr. Murphy, have you as much as a glass of clane cowl'd wather for a poor boy?" Needless to say, ample amends were made for the late forgetfulness.

Nor long ago, at the dinner table at the Palette Club, of which the Hon. Noah Davis is president, were gathered a few bright gentlemen to a little feast to John M'Cullough, the actor. Among them were the president, Judge Brady, Rev. Dr. Bellows, Dion Boucicault, Rev. Mr. Alger, District-Attorney Phelps, Lawrence Jerome, William Winter, Consul-General Bodisco, William J. Florence, Clark Bell, and others. There was great hilarity, a rattle of wit, much bright reminiscence and anecdote, to say nothing of the "feast of reason and the slow of foul."

Judge Davis observed as follows: "I remember our friend Larry Jerome when he was not so good a Democrat as he is now. In fact, he professed to talk for the Whigs, and on one occasion this is the description he gave of his present

friends the Democratic voters when they beat his party at Syracuse. 'They approached the polls,' said he, 'on all fours; and, by Jove, it was only when they *reared up to vote* that we discovered they were human beings.'

"That," said John M'Cullough, "reminds me of a Syracuse man who staid overnight at Utica, and went to see Ned Adams play in *Damon and Pythias*. The old fellow kept very quiet until Adams came to the well-known line,

'There is no public virtue left in Syracuse.'

That touched his local pride, and, rising, he exclaimed, in stentorian tones, 'No, by jingo, nor in Utica either, if it comes to that!'

A controversy having arisen between Mr. Jerome and Judge Brady, the latter said, "I am in the position of the negro judge who was asked to grant a nonsuit. 'A what?' he indignantly inquired—'a nonsuit? Dis Court sits here to listen to de trials and lay down de law. It's contempt of dis Court to ask it to say nonsuit, which just means no suit at all. Dis Court don't give up its suits, its privileges, and its own bread and butter. Go right on wid de case!'"

William Winter gave this impromptu:

"Sometimes in poverty the heart grows cold
While it maintains the struggle for high art;
But John M'Cullough, from the land of gold,
Brings, as his precious prize, a golden heart."

And Mr. Boucicault related the following: "A great many years ago—longer than I like to remember—I went to Philadelphia to try one of my pieces, *Jessie Brown*, at one of the theatres. A small actor was cast for a very small part, that of Achmet, I believe. He had only six lines to speak, and he took the stage and spoke them like a tragedian. I called him down and said, 'See here, young man, you're not playing Othello.' 'I know I ain't,' he replied, 'but I will some day,' and then walked off, muttering something about punching my head. His prediction has come true. That bad Achmet, but good Othello, was John M'Cullough."

Now that the dogs of war have been let loose between Russia and Turkey, and the process of scientific slaughter commenced in the most deliberate manner possible, the following lines, taken from Moore's Almanac for 1829, under the head of "Monthly Observations," may be pondered with interest:

Whene'er contending princes fight,
For private pique or public right,
Armies are raised, the fleets are manned,
They combat both by sea and land.

When, after many battles past,
Both, tired with blows, make peace at last,
What is it, after all, the people get?
Why, taxes, widows, wooden legs, and debt.

A NEW *Life of Rowland Hill*, by Mr. Charlesworth, has just appeared in London, with an introduction by the Rev. Mr. Spurgeon. It contains many stories of that remarkable man, the best of which seem rather apocryphal. A few of the briefest are as follows:

A note was handed to Mr. Hill while he was preaching for a charity, to ask whether it would be right for a bankrupt to contribute. "No,"

said the preacher; "but, my friends, I would advise you who are not insolvent not to pass the plate this evening, as people will be sure to say, 'There goes the bankrupt.'"

A Scotch minister assisting at an ordination, not being able to reach with his hand the head of the candidate, laid his cane upon it. "This," said Mr. Hill, "did equally well. It was timber to timber." (This sounds apocryphal.)

An Antinomian reproached him with preaching "a legal gospel." "Do you acknowledge," asked Mr. Hill, "the Ten Commandments as a rule of life?"

"Certainly not."

"Charles," said Mr. Hill to the servant, "show that man to the door, and keep your eye upon him till he is beyond the reach of the coats."

WE are quite sure that the ladies who read the Drawer will be glad should the report prove true that Lord Dufferin, Governor-General of Canada, will probably succeed Sir Edward Thornton as British minister at Washington, as it will take to the capital his accomplished wife, who is the author of the following witty poem:

KATEY'S LETTER.

Och, girls dear, did you ever hear I wrote my love a letter?

And although he can not read, sure I thought 'twas all the better;

For why should he be puzzled with hard spelling in the matter,

When the *maning* was so plain, that I love him faithfully?

I love him faithfully, and he knows it—oh, he knows it, without one word from me!

I wrote it and I folded it and put a seal upon it; 'Twas a seal almost as big as the crown of my best bonnet;

For I would not have the postmaster make his remarks upon it;

And I said *inside* the letter that I loved him faithfully.

I love him, etc.

My heart was full, but when I wrote I dared not put the half in.

The neighbors know I love him, and they're mighty fond of chaffing;

So I dared not write his name *outside* for fear they would be laughing;

So I wrote, "From little Kate, to one whom she loves faithfully."

I love him, etc.

Now, girls, would you believe it, that postman, so *consated*,

No answer will he bring me, so long as I have waited; But maybe there *mayn't* be one, for the *reason* that I stated,

That my love can neither read nor write; but he loves me faithfully.

He loves me faithfully, he loves me faithfully, And I know where'er my love is that he is true to me.

ONE of the oldest and most highly esteemed of our correspondents contributes a few pleasant anecdotes:

A Penobscot Indian, who never used the first person in speaking, and did not give a positive assertion about any thing, but "supposed," was asked—"Well, John, how did you get through the winter?"

"Well, he s'pose he keep tavern tree times," said John.

"Kept tavern three times during one winter! How is that, John?"

"Well, he s'pose he buy a jug o' whiskey once, and s'pose he keep tavern till it all gone. Well,

s'pose he buy another jug o' whiskey, and he keep tavern till that all gone. Well, s'pose he buy another jug o' whiskey, and he keep tavern till that all gone. So he s'pose he keep tavern tree times. The whiskey lasted—quick!"

A FRIEND of the writer was once travelling in a stage-coach in New England, and arrived at a village at nine o'clock in the evening, where the vehicle was to remain until morning. Having some acquaintances in the town, he went out immediately to call upon one of them. Returning to the tavern at midnight, he found all the beds in the house occupied but one of a dozen cots that had been put up temporarily in the parlor, for it was "court week" at that county seat. During the day my friend had been greatly amused by a fellow-passenger, a lively young Frenchman. Where he was that night my informant did not know when he retired to the unoccupied cot in the parlor, but he soon found out. The sleepers in the other cots were making "night hideous" with their snoring in varied cadences, some puffing, some with long-drawn nasal sounds, and all in discord. At length one of the snorers brought up with a snort and was suddenly silent, when the young Frenchman, who occupied a cot at the farther end of the room, and had been annoyed by the noise of the sleepers, cried out, "Tank God, von ees dead!"

A LITTLE four-year-old daughter had watched with interest the unfolding of flowers in a garden, seeing a rose blossom changed from a bud to a full-blown rose in a short space of time. One day she saw a turkey-cock suddenly expand his tail into a fan, in the act of "strutting," when she ran in to her mother and exclaimed, "Oh, mother, I've just seen a turkey bloom out!"

WHAT Edmund Yates says of London, holds equally good in New York. "In these days," says he, "of architectural imbecility, it is pleasant to meet with a candid and unpretending builder who frankly avows his style. Down Denmark Hill may be noticed a lot of brick houses, which are conspicuously announced on a large stone slab to be 'Elizabeth Ann Villas.' There is so much more of the Elizabeth Ann style than of the Elizabethan, nowadays!" But they haven't yet in London any of our "Pointed Ironie" or "Early Cathartic" styles.

AN old New York editor thus pleasantly writes of and to the Drawer:

I have just laid down the April Drawer with the same feeling of regret and pleasure that has been experienced after a perusal of the three hundred and twenty-two installments that preceded it—regret that the Drawer was not a bigger one, and pleasure because it was so full of good things. This month Silas Wegg must have been at your elbow, for I see that you drop into poetry a good deal. I am glad, also, as an old reader and contributor to the Drawer, that the Harpers have again taken to illustrating the Drawer; for since the old days when dear good John M'Lenan used to brighten its pages with his clever pencil, we Drawer readers miss the pictures very much. But I sat down to give you matter, not advice.

Editors of newspapers have a good deal of fun over queer expressions in copy that comes before

them, for reporters are compelled to write so hurriedly that they frequently compose sentences that are extremely funny.

A reporter once gravely stated that an inquest had been held over a child which "was one of a pair of triplets"—a statement that was almost as confusing as the assertion regarding a dead man, "that the places that knew him so long have known him no more ever since."

A writer was once ordered to write an article on an approaching election, and he announced that the "polls would be only open between the hours of sundown and sunset," which was rather short notice for the voters.

Another, in describing a "shooting scrape," stated that the wounded man had been hit by a ball in the head "near the corner of Broadway and Twenty-fifth Street." That was as puzzling a problem in phrenology as the anatomical one contained in the statement that Dennis O'Rafferty had been "wounded in the fore-arm near the left shoulder."

Quite recently an evening paper stated that President Hayes went to Senator Sherman's residence on his arrival in Washington, "where a substantial breakfast and several of his intimate friends had been prepared for him." A cannibal President is not a very cheerful prospect for the office-seekers. Another paper stated that the new President had privately taken the oath of office in the presence of Chief Justice Waite, President Grant, and Mr. Fish, *who were absent*. Now who were absent or who were present on that occasion must remain a mystery forever.

A musical critic once wrote about a performance of the opera of *Il Trovatore*, and told his readers that the rendition of the Marseilles hymn in the forge scene was exceedingly well rendered; and we see no reason why it should not be, if Verdi had condescended to include it in his wonderful score.

A police reporter, in concluding his account of a dreadful murder, made the astonishing statement that "the victim expired *before* making an *ante-mortem* statement."

Another knight of the pencil, in writing on the ice question, declared that "as for the thousand and one carts that go about the city peddling ice under the names of the Crystal Ice Company, etc., they have no existence except on the sides of the wagons." Now what had no existence, the carts or the companies, it is of course impossible to decide.

But reporters are not alone in making funny sentences, for at a recent spiritualists' meeting in this city a medium rose and said he "was prepared to nail every skeptic to the mast-head." Needless to say that no skeptic presented himself for the execution of the direful threat.

In writing about an assault, a reporter stated that the assailant was arrested for striking a man *who was driving a sleigh with a brick*.

I WAS in Washington city at the time when Mason and Slidell were captured, and we thought our troops were about to gain possession of Charleston. I called upon President Lincoln with the late venerated Comptroller Whittlesey, and in the course of conversation I said, "Mr. President, we of the North feel like punishing the Charlestonians a little, for they are arch-offenders."

"I feel a little so myself," he said; "but what

shall we do with Mr. Pettigru?" The latter was a staunch Union man, and remained so while the madmen raged around him.

The question suggested a "little story" to Mr. Lincoln. His eyes sparkled with humor, and he said, "A chap in Illinois was very fond of relating Scripture narratives. At one time he was telling the story of the destruction of Sodom and Gomorrah, and the promise of the Lord to save the cities if a certain number of righteous men could be found in them.

"How many righteous men did the Lord accept?" asked a listener.

"I don't now exactly remember," said the narrator; "I know Abraham beat down the Lord a good deal."

"So," said Mr. Lincoln, "they may beat us down to Mr. Pettigru, and save Charleston."

IN Crayford church-yard, England, may be found the following singular inscription on a headstone set up by the parishioners in remembrance of Peter Isnell:

Here lieth the body of Peter Isnell (30 years clerk of this parish). He lived respected as a pious and a mirthful man, and died on his way to church to assist at a wedding, on the 31st day of March, 1811, aged 70 years. The inhabitants of Crayford have raised this stone to his cheerful memory, and as a tribute to his long and faithful services.

The life of this clerk was just three score and ten, Nearly half of which time he had sung out Amen. In his youth he was married, like other young men; But his wife died one day, so he chaunted Amen. A second he took; she departed; what then? He married and buried a third, with Amen. Thus his joys and his sorrows were treble, but then His voice was deep bass as he sung out Amen. On the horn he could blow as well as most men, So his horn was exalted in blowing Amen. But he lost all his wind after three score and ten; And here, with three wives, he waits till *again* The trumpet shall rouse him to sing out Amen.

A CORRESPONDENT at La Jara, Conejos County, Colorado, writes as follows:

DEAR DRAWER,—The subjoined may be acceptable, and in that hope I indite:

In the new mining county of San Juan, in the southwestern portion of Colorado, many curiosities of humor and eccentricity are to be met with on every hand. A most fruitful source of oddity are the location stakes. By the laws of the United States in Colorado, a discoverer of a lode is entitled to 1500 feet on the vein, and 300 across, to each location, and must, within sixty days after discovery, expose the vein to ten feet below its surface. This is called his assessment, and if not completed within the specified period, renders the lode liable to "jumping," or passing into the possession of others. Sometimes, however, unless the lode be very rich, if a man is engaged in working down his assessment when the sixty days expire, his property is rarely jumped, a few days of grace being allowed by the miners.

A case of this kind occurred a short time ago. The period had all but passed, and the shaft yet lacked some three feet of the required depth; but the owner each evening upon quitting work left his tools as a token that he was endeavoring to finish his assessment. There was another, however, intent on jumping the lode, and on the last day of the sixty, as he passed by, the owner having gone home, he wrote upon the spade at the bottom of the shaft, "Spades are not trumps in this game, my boy." The next day the would-be

jumper returned to re-locate, but finding beneath his notice of the preceding day, "No, but clubs are," changed his mind.

Another man, in tramping about, found that one of his mines had been jumped. He took out his pencil and wrote beneath the new location: "This lode has mineral in it, my six-shooter has lead; if you take one, you will have to take the other; so make your choice."

Still another individual wrote on the stake of one of his jumped leads: "I'll play you a game of seven-up as to who holds this location." The jumper saw the notice, and came down to the cabin of the former owner. The game was played, and the jumper lost.

Sometimes these notices are couched in verse: "Don't jump this lead, or I'll make you bleed," is one. Another, "I'll bust your head, or shoot you dead, if you ever jump this lead." But the most elaborate poetical mining couplet I have ever seen is:

I've staked this claim
In my own true name,
And intend to work it too;
And a warning give
To all that live—
They'll get into a stew
If ever they dare
To jump my share,
And my name is

JOHN CONBLEW.

A "jumper" came, and, after re-locating, added:

We've heard ducks talk,
And seen them walk,
But we don't give room;
So stop your jaw,
For Moses' law,
In all its bloom,
Will make your lot
A leaden shot,
And send you up the flume."

That settled it.

The nomenclature, too, is highly original. We have a mine called the "Grub-Stake;" another is "Hard to Beat." There are others with such names as "Pay Rock," "Copper Pot," "Cracker," "Hoosier," "Tar-Heel," "Hunkeydory," "Solid Boy," "Last Trump," "The Ragged Millionaire," etc. Then there are the "Big Maria," "Smashing Jennie," "Jolly Polly," "Hunkey Lucy," "Jilting Helen," and "Heartless Em."

THE amusing scene described below occurred a few Sundays since in the Episcopal church at St. Augustine, Florida, and was afterward jotted down by an old and esteemed friend of the Drawer:

He was past middle age—an editor, they said—and wore a beaming smile as he walked up the middle aisle, glancing from side to side. The pew next to the front was vacant, and he took a seat with a rather uncertain air.

"Can I sit here?" he said, speaking to his neighbor in the adjoining pew.

"Oh yes; the pews are free."

"I want a seat for a friend. She is a granddaughter of Jefferson."

"Certainly."

"Who is the minister?" (in a loud tone).

"Mr. Root."

"No; I mean that other man, the stranger" (snubbingly).

"I do not know."

He was evidently uneasy, and stood up, facing the congregation, with an expectant air. He turn-

ed to Mr. Astor, who sat behind him, and said, in an explanatory way,

"I am expecting a friend, a granddaughter of Jefferson. Can I seat her here?"

"Certainly."

He was not satisfied—perhaps she was already in the church; and he walked down the aisle and back again, peering into every face. He had hardly seated himself again before a lady and child appeared in the aisle, to whom he hastily offered seats.

"Is this your pew, madam?"

"No, Sir."

"May I sit here?"

"Certainly."

"I wish to offer a seat to a friend of mine whom I am expecting. She is a granddaughter of Jefferson."

To this there was no answer, merely a bow. Our friend continued:

"What is your name?" (standing up, and leaning over the child).

"Paine."

"Do you spell it with an *i* or a *y*?"

"With an *i*."

"My name is Walker. What State do you come from?"

"From Massachusetts."

"From near Boston?"

"From Boston."

"Oh!"

He is restless, and looks around. General and Mrs. Dent appear. He gives a seat to the latter, the general—who, by-the-way, is in command at St. Augustine—going over to a far corner. Again the question,

"What is your name?"

"Dent."

"My name is Walker. Mrs. Dent, allow me to introduce you to my friend Mrs. Paine." (Evidently used to the amenities of polite society, he feared the ladies might not feel at ease sitting side by side in church without an introduction.)

Another restless waiting. Then spying General Dent in his far corner, he goes over to him and asks,

"Won't you take my seat?"

"No, thank you."

"You can't see the minister over here."

"No matter."

In the mean time the pew is filled; our friend settles himself upon a front bench, and subsides as the service commences.

The granddaughter of Jefferson does not seem to have made her appearance.

And Walker has faded from Florida.

AN editorial friend connected with the *Daily Oregonian*, published in Portland, Oregon, sends us this story of a preacher over on the John Day River, in Grant County, in that State: As is usual nowadays at the conclusion of the services, this expounder of the Gospel announced that he would take up a collection; and as his hearers were rather slow in starting, he sprung from the pulpit, seized his hat, jerked a half dollar from his vest pocket, and said, "Now there's got to be eighteen dollars raised right here, brethren, and I'll start the thing by throwing in four bits." The effect was magical, and soon twenty-three dollars were collected. The circuit-rider counted it out carefully, and, with a smile breaking over

his chin, said, "Brethren, here are twenty-three dollars; and as we only needed eighteen, I guess I'll take my half dollar back." He then launched off into an extravagant eulogy of the liberality of the miner as compared with the people of the Willamette Valley, who, he said, "would pinch the eagle on a half dollar at a donation meetin' till it just squealed."

An officer of the navy, on board one of our vessels in China, tells us this neat thing in the way of blessing:

A man on board the U. S. S. *Monocacy*, whose term of service had just expired, proceeded to take leave of his late officers. Approaching the commander, he invoked the choicest blessings on his head, in a brogue that left no doubt as to his native sod. And so he went from one to another with a "God bless ye!" or "May Heaven reward ye!" until he came opposite the lieutenant-commander, who had frequently been obliged to sup-

the pulpit or at the bar. We have, however, in the following, sent to us by a friend at Taylor's Falls, Minnesota, a paragraph that is by no means to be sneezed at. It is appended to a notice for the election of school district officers in one of the towns of Rice County, which our informant found fastened to a tree at the cross-roads:

N.B.—The wisdom of our laws having tolerated woman to cast the light of her benign influence beyond the confines of the nursery, by permitting her to practically use the genial rays of her susceptible intelligence in directing the moral and mental culture of man, it is therefore desirable that the lady voters of this school district should use their franchise with a steadfast purpose to advance the social and intellectual training of the rising generation, to whom destiny intrusts the guardianship of human happiness in the near future.

A GENTLEMAN in Boston sends us the following anecdote of the late Dr. Lyman Beecher, which he thinks has not heretofore been in print:

While Dr. Beecher was settled in Litchfield,

CONTEMPLATION.

EXULTATION.

SCATTERATION.

press Pat's love for the "ardent" by stopping his leave. With a reluctant touch of his cap, and downcast eye, he mumbled out, "And may God bless you too, Misther C——, to a sartin extint!"

How most speedily to find a wife is a problem often solved successfully by Anglo-Indians during their brief furlough in England. The following is recorded in a Punjab journal received by last mail:

A disappointed wife-hunter had completed the purchase of an outfit in a well-known establishment in Westburnia, when he was asked by the grateful proprietor, "Can we do any thing more for you to-day?"

"Thanks, nothing," was the reply; "I've all I want—except a wife."

"Will you be pleased to step this way?" said this prince of shop-keepers, leading his customer up to one of the apprentices, a lady-like girl, whom he introduced as the daughter of a deceased officer.

"Wooded an' married an' a'" in a fortnight, the lady is now a happy wife, making one of the dullest Punjab stations bright and lively.

THE act of sneezing is an involuntary one, though the person about to explode into that violent action usually has a momentary premonition of what's coming. "Not to be sneezed at" has come to be a common proverb, understood by the most youthful of ragamuffins, though seldom used for purposes of illustration either in

Connecticut, a young man called upon him with reference to uniting with his church, but expressed a desire to be baptized by immersion. To this the good doctor readily assented, and proposed that they should at once proceed to the river near by for that purpose; which was done, and the young man was dampened to his heart's content. Dr. B. returned to his house, and, sitting down in the kitchen, proceeded to remove his wet shoes, remarking, "Ugh! got my shoes full of sand; *knew 'twan't the way!*"

THIS comes to us from a United States functionary in Tennessee:

During the hotly contested canvass in 1873 between Maynard, Johnson, and Cheatham for Congress, for the State at large, a gentleman met an old friend, an enthusiastic Irish-Catholic Democrat, and asked, "Well, Mr. Mac, will the Irish vote for Mr. Johnson at this election?"

"Yis, ivery wan of them are for him except wan, and I brought him over."

"What was his objection to the President?"

"Well, he said he wouldn't vote for no man who had hung a woman; and I towld him what a friend Andy was to us when he defated the Know-Nothings in 1856; and besides, and wasn't it betther to hang Mrs. Surratt, who was a good Catholic, than to hang some poor Protestant woman who wasn't prepared?"

And the man was not jesting; meant every word of it. Mr. Johnson, to whom it was related, enjoyed it immensely, in his quiet way.

HARPER'S NEW MONTHLY MAGAZINE.

No. CCCXXVII.—AUGUST, 1877.—VOL. LV.

THE OLD MAN OF THE MOUNTAINS.

THE WHITE MOUNTAINS.

SUMMED up in the briefest way possible, the White Mountains are the highest elevations of land east of the Mississippi, next in altitude to the Rockies themselves; they are situated in Northern New Hampshire, and extend about forty miles north and south, and nearly the same distance east and west. The peaks cluster in two groups, the eastern being known as the White Mountains proper, and the western as the Franconia. They rise from a plateau about forty-five miles long, thirty miles wide, and sixteen hundred feet above the level of the sea. Several flashing rivers wind among them, passing through four of the prettiest valleys in America—the Saco, the Connecticut, the Androscoggin, and the Pemigewas-

set. Their constitution is a conglomerate rock resembling granite. Every school-boy knows that Mount Washington is the highest, and next to this are Mounts Adams, Jefferson, Madison, and Monroe, all of which are in the main range. The highest peaks in the Franconia group are Mounts Pleasant, Lafayette, and Liberty.

Few visitors are ever disappointed in these mountains, however great their anticipations may be, and thousands of tourists of the most fashionable class, who are wearied of nearly all other pleasure resorts, from the blue waters of Lake Como to the tropic walls of St. Augustine, from the Mammoth Cave to the valleys of Iceland, and from the Garden of the Gods to Mount Desert, and who are as much “used up” as Sir Charles Coldstream in Mathews’s farce, visit them again and

NORTH CONWAY, NEW HAMPSHIRE.

again, and always go away satisfied. There is a peculiar and inexhaustible beauty about them, which is best attested by the number of artists who frequent them year after year. Nowhere else do we so often find the picturesque gentlemen of the easel. The sketch-book and the brush recur with such astonishing frequency that we are at first inclined to believe the whole area must have been transferred to the portfolios of these indefatigable lovers of nature, but a further experience teaches us that each day, each hour, the atmosphere transforms every object, bringing this knoll into greater prominence, subduing that, transmuting the purple into blue, the yellow into gold, lighting crimson fires here and spreading a gloom there, until it seems that a whole lifetime spent in portraying one object only would still leave the task unfinished.

Nor does the variety of the scenery depend on the evanescent effects of the atmosphere alone. The more tangible influences of geology have produced a wonderfully varied conformation of rock in pinnacle, curve, and ravine, while each feature is softened by an indescribable charm which makes the most violent convulsion of nature appear sweet and calm.

The steady increase of visitors to the mountains has developed many ways of reaching them from New York, Boston, and Canada; but one of the pleasantest routes, if the tourist has time and has the sea-going qualities of a good sailor, is that by steamer

from the metropolis to Portland, which involves a voyage of two days along the New England coast, with many glimpses of sunny beaches and surf-beaten cliffs.

Early on the second morning you are landed in the quiet harbor of Portland, and thence conveyed by rail to Conway—that pastoral spot which has been fervidly painted in water and oil so often that people who have never been there know it almost as well as its inhabitants. What pen can translate the exquisite beauty of this Arcadia—the fragrant exhalations of the meadows in autumn, the deep repose of the hazy hills, the rural perfection that delights the eye every where? The White Mountains found their truest interpreter long ago in Thomas Starr King, who had as intimate a knowledge of them and as subtle a sympathy with them as Herrick had with the English country lanes, and Irving with the quaint life of New Amsterdam; but vivid as his utterance is, it fails to completely grasp the manifold charms that present themselves—a fact that he himself appreciated. “Varying with each hour,” he has written, “the favored visitors will have the full range of summer views, the anthology of a season gathered into a portion of a single week. The mountains seem to overhaul their meteorological wardrobe. They will array themselves by rapid turns in their violets and purples and mode colors, their cloaks of azure and caps of gold, their laces and velvets, and their iris scarfs. One day it will be so clear that,

for the eye, space seems to have been half annihilated. Every sharp ridge lies in the sky like the curving blade of an adze, and the pinnacles tower sharp as spears. The few shadows that spot the slopes seem engraved upon them. Then will come a day sacred to clouds. Or perhaps the south wind fills the air with dusty gold, and

makes each segment of a district that was prosaic enough a week before, seem a sweet fraction of Italy. Possibly it tries its hand at mists. Then what mischief and frolic! It brindles the mountain-sides with them; or it stretches them across their length as though it meant to weave all the vapors which the air could supply into a narrow and interminable web of fog. Now, again, it twines the mist around their necks; then it smothers the peaks with them, and soon tears them apart to let the grim heads look out; and before long, in more serious mood, it bids them steam up and off, like incense from mighty altars."

And here, while we are still at Conway, which is both a rendezvous and a starting-point for all explorers of the mountains, let us look at some of the social characteristics of the region, which are not less interesting than the topography. In the months of July and August the flood of fashion is overwhelming, of course, and the dialect of Boston or New York falls oftener on the ear than the nasal drawl which answers for

VALLEY OF THE SACO.

speech with the native. But the native is there, the indigenous Yankee lineally descended from the early pioneer and mountaineer, whose forefathers trapped and hunted among the pines when the summit of Mount Washington was a white mystery to the oldest and hardiest—an odd, homespun mixture of shrewdness, wit, thrift, and good nature. You find him under the portico of the country store, with a crowd of boon companions, who, like himself, are gaunt, freckled, and sinewy, and whose limbs appear to be hung together on wires. The visitors, constantly coming and going in the train of pleasure, make the summer lively for them; but when these birds of passage are flown, and the mountains are wrapped in snow from summit to base, they will fall into the quiet routine of primitive life in the old farm-houses.

The expensiveness of the hotels excludes the semi-fashionable element from the visitors. To "do" the White Mountains fashionably means an expenditure of fifteen or twenty dollars a day, for the charges of the leading

hotels, high as they are, form only a small item compared with the grand total of "extras," incurred for guides, drives, and other inevitables. The railway fare up Mount Washington is three dollars, and the fare down Mount Washington is an equal amount, an additional sum being charged for any bag or bundle that can not be carried in the hand. The mildest drink costs twenty-five cents. Nearly as much is asked for carriage hire as would buy a respectable horse and buggy. And while the rate for board is four or five dollars a day below the summit, the price at the summit is six dollars a day.

The society is so select, and the accommodations are so excellent, however, that no one who can afford it will complain of

the White Mountains can you find a *garçon* to whom Plato and Darwin, Gibbon and Euclid, Latin hexameters and the whole theory of evolution, are matters of such ready-tongued familiarity as they are to this bright-eyed youth who inquires whether you will have your potatoes stewed, boiled, or mashed?

As I have said, the semi-fashionable element is excluded, and there are comparatively few cheap boarding-houses. The inmates of the hotels belong principally to the best class of American society—the unostentatious representatives of wealth and intellect. And before going farther, I intend to pay the frequenters of the White Mountains an immense but just compliment.

If I wished to show an Englishman the

SELECT WAITERS.

the cost. The polite young gentleman who attends to your wants at table, bringing you a dish of fresh eggs and a glass of creamy milk, if they have been in your order, is a Sophomore at Harvard, and he is not the victim of any bitter reverse in life, as you may be inclined to think. The servants at many of the hotels are college students, who, by service of this kind, are enabled to pay their fees; and the girls in attendance—modest New England girls, with honest, intelligent faces and neatly braided hair—are likewise students. The polished, noiseless, profoundly attentive waiter of good restaurants in Europe may be able to talk with you in three or four different languages, but where else in the world than

best part of American society, I certainly would not take him to Long Branch, for a few diamonds and silks form the line of demarkation between that resort and a much cheaper one—Coney Island. I might take him to Newport, but I would prefer, being anxious that his impressions should be favorable, to introduce him to the company that often gathers, as the weather grows cold, before the big wood fires in the parlors of a White Mountain inn. The divinity that hedges in a king is not easily analyzed, and the charm of good-breeding evades a closer definition than the words "courtesy" and "intelligence" express. There is that within the assemblage of White Mountain travellers which places them on a plane and in an atmosphere of their own, and which is peculiarly grateful to the stranger admitted.

Next to the artists, the most frequent travellers met by a pedestrian on the road are students or clerks who are "footing it," with an infinitesimal quantity of baggage and an infinite degree of zeal and good temper. "Give me youth and a day, and I will make the pomp

MOUNT CHOCORUA.

of emperors ridiculous!" With a stout stick, a knapsack, and a boyish capacity for enjoyment, these ruddy fellows make the sybaritish occupants of hotels and carriages appear miserable. You meet them swarming up the face of the mountains by short-cuts, resting by the bubbling springs and brooks, and puffing their short cutty or brier-wood pipes, chatting with the harvesters in the meadows, and taking Nature in at the pores, as Joey Ladle would say. The other travellers seem to be suffering under the lethargic blight of overrefining; a little more of the rough-and-ready element in their pleasure-seeking would make them happier.

The village of North Conway lies on a fertile upland, surrounded by hills and mountains, and overlooking the reaches of the Saco, at the head of which, apparently, is Mount Washington, a monarch among the regiment of giant forms which cluster about it. To the east is a range of hills, with Mount Kearsarge predominant, and to the west of the river is Moat Mountain and the

Peaks of Chocorua. These four mountains are the most noticeable, but many others loom up in the north, mantled with depths of purple, blue, and gold in the changing light of the day. There is a very ecstasy of color in the morning and evening, a passionate intensity that will not admit of description, and it is not easy to say whether the mountains are most beautiful in the amber daybreak, when watery wreaths of clouds lie upon them, or in the pathetic twilight, when the foliage hangs blackly against the tender gray sky, and the last gorgeous rays of sunset are swallowed up in the victory of night. But it is certain that they are beautiful at all times—beautiful with a beauty of their own that is incomparable to any thing in the Alleghanies or the Rockies.

The neighborhood of Conway contains many natural features of interest, including the Artist's Fall, a picturesque cascade set among forest trees and rocks, and Echo Lake, at the foot of White Horse Ledge. The "White Horse," which can be seen from the

ECHO LAKE, NORTH CONWAY.

CRAWFORD NOTCH.

village, is the figure of a horse impressed upon the perpendicular sides of a range of cliffs, which extend four or five miles along the banks of the river, and vary in height from a hundred to eight hundred feet. At one point a natural cavity, called the Cathedral, has been formed in the solid granite, with walls about eighty feet high, and an arched roof. The floor is strewn with large blocks of granite, and several full-grown trees spring up between the crevices.

Another picturesque spot is that which is romantically called Diana's Bath. This is a little farther north than the Cathedral,

and is reached by a shady woodland path leading over some granite ledges to a rivulet, which trickles and breaks in silver and white until it tumbles over another ledge about ten feet high. The action of the water has worn several basins in the rock, the largest being about nine feet in diameter, and the pools thus formed are indeed fit for as chaste a goddess as Diana.

As we leave Conway we get another view of Mount Kearsarge, which may be ascended by a bridle-path, and our next hostelry is the Crawford House, which is reached through the famous White Mountain Notch.

FRANCONIA VILLAGE AND PROFILE NOTCH.

The valley gradually narrows, and the hills inclosing it become more abrupt as we travel northward. The road winds by the flank of Bartlett Mountain, and over many turbulent brooks. From the Willey House to the gate of the Notch, the walls by which we are inclosed increase to a height of 2000 feet, and at the gate the river flows between sheer cliffs, with harebells and ferns drooping from their faces.

The Willey House is the monument of that disastrous land-slide which has been commemorated in both prose and verse. Here, in 1826, was a little tenement occupied by Samuel Willey, Jun., and his family, and we are told that his hospitable kindness and shelter were as much sought by travellers in winter-time as the shelter of the monks of St. Bernard. One bright June morning, says Starr King, the little meadow farm, flecked with the nibbling sheep, and cooled by the patches of shadow flung far out over the grass from the thick maple foliage, must have seemed, to any one pausing there and hearing the pleasant murmur of the Saco, as romantic a spot as one could fly to for security from the fever and perils of the world. Late in that peaceful June, Willey, looking out of a window, saw a large mass of the mountain sliding down, sweeping rocks and trees before it, and hurling its frightful burden across the road. At first the family were greatly terrified, and resolved to move from the Notch; but Mr. Willey, on reflection, felt confident that such an event was not likely to occur again, and was satisfied with building a strong hut or cave, to which the family might fly should another avalanche seem to threaten their home.

Later in the summer there was a long drought. By the middle of August the earth to a great depth in the mountain region was dried to powder. Then came several days of south wind, betokening copious rain. On

Sunday, August 27, the rain began to fall. On Monday it increased, and the clouds around the White Mountain range, seen from a distance, were heavy, black, and awful. Valleys were flooded, bridges swept away, live stock drowned, and farm buildings demolished. In the little settlement of Gilead thousands of tons of earth and rock were detached from the overhanging hills, and the roar of these slides was far more frightful than the thunder, and the trails of fire from the rushing boulders were more awful than the lightning.

For several hours the Willey family were

THE POOL, FRANCONIA.

in constant terror. The father and mother, anxious for their young children, recalled the land-slide of the previous June. In every pause of the thunder they strained their ears to catch the sound of another grinding avalanche, and at last they heard the moving of a loosened ridge, heard louder and louder its increasing roar, heard—and saw, perhaps—that it was rushing in the line of their little home, and, unable to command their nerves, they ran out of the house into the storm.

The next morning was cloudless, and the

and clothing showed that they had been hurriedly left, and a Bible was lying open on the table, as if it had been read just before the departure of the family. Neither Willey, his wife, nor children could be found, and it was at first supposed that they had retreated to a neighbor's house; but a search discovered them, some days later, buried in the drift.

An ordinary storm in the mountains is terrible enough to a lowlander. It sweeps upon one with the unexpectedness and violence of a tornado. The day may be clear

and warm, and the azure expanse of the sky checked only by a few patches of white cloud; but suddenly the mutterings of thunder proclaim a coming tempest, and before a refuge can be found, the whole earth and the whole heaven are enveloped in a vaporous gray, which distorts or completely blots out every surrounding form with its cheerless monotone.

The first drops of rain fall on the leaves heavily, and the leaves themselves are violently disturbed. Though little wind can be felt by the spectator, the trees seem to shake at their very roots with apprehension, and before long the bravest human heart is appalled by the unusual and terrific force exhibited by the rain, lightning, and thunder.

When the storm

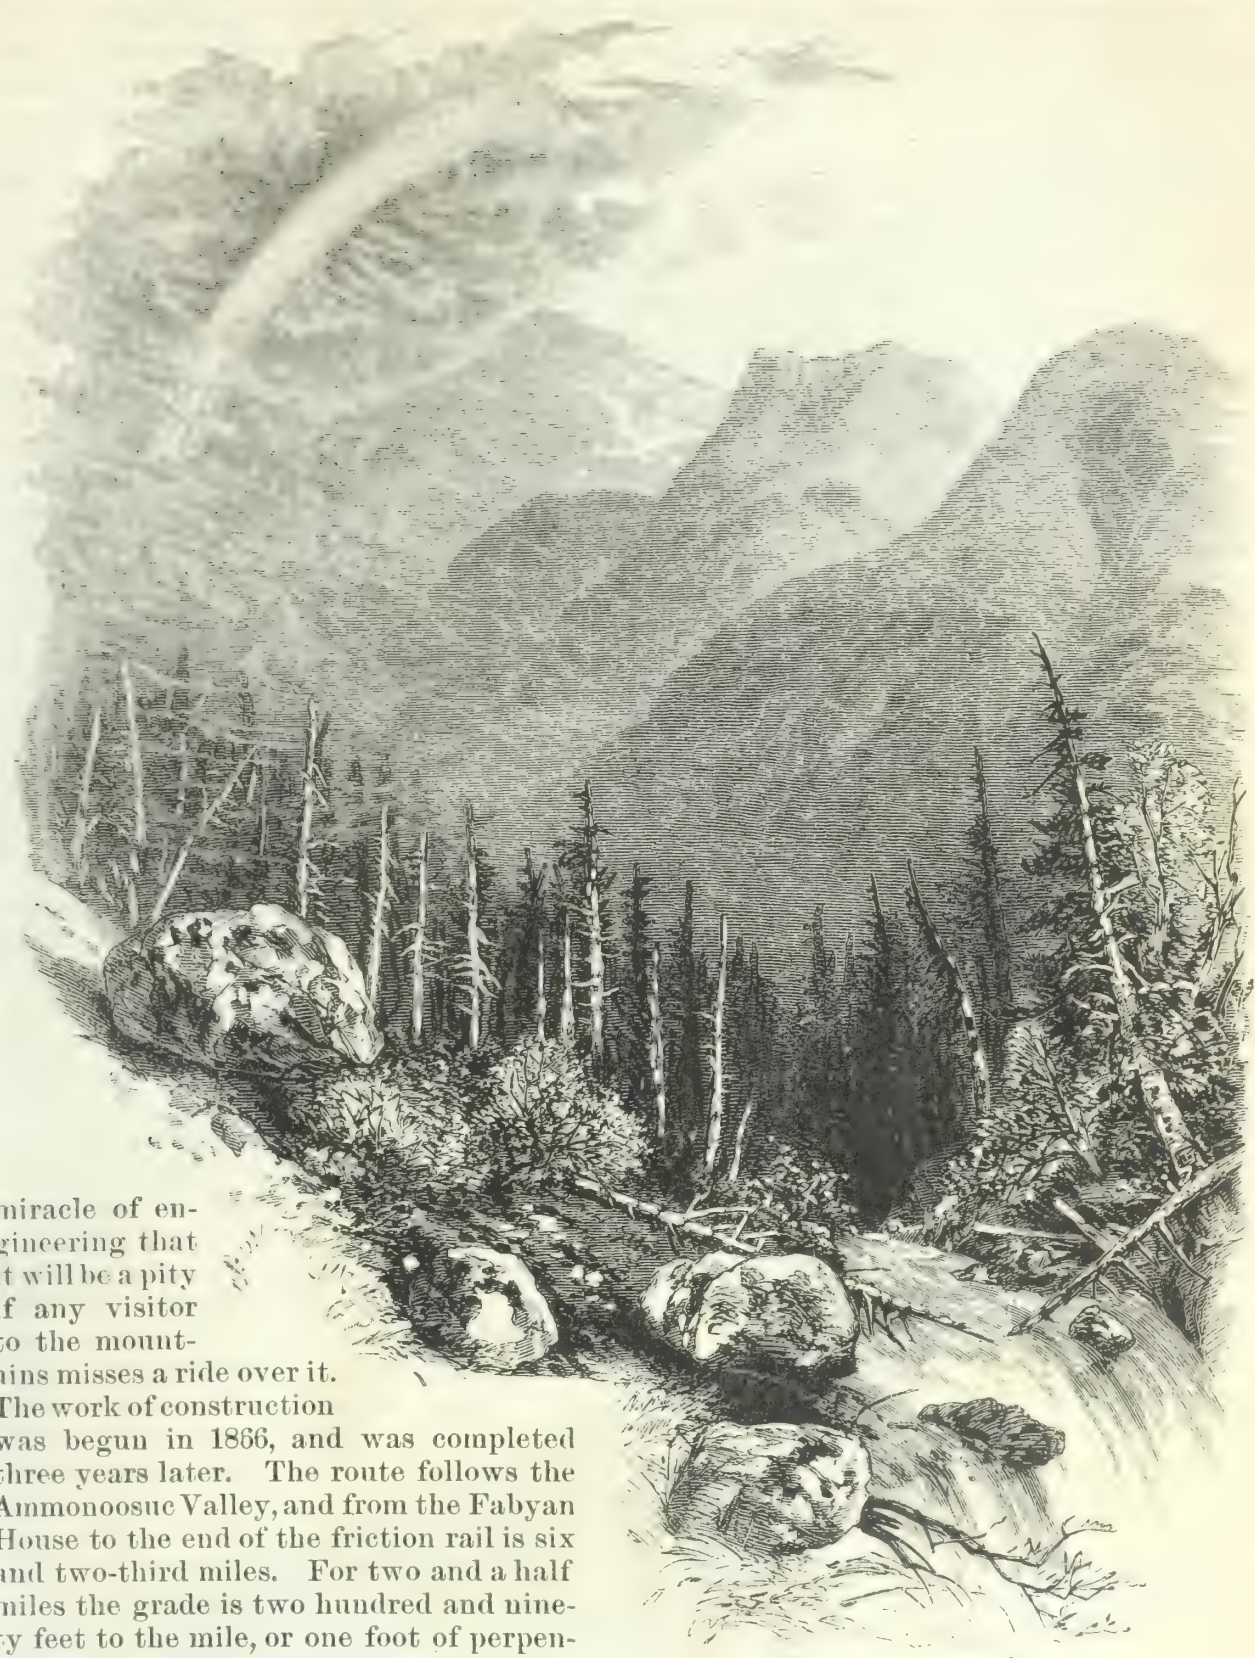

MOUNT WASHINGTON RAILWAY STATION.

air was remarkably transparent, revealing the far and wide devastation caused by the storm. A traveller found the little house in the Notch still standing, but surrounded with desolation. The mountain behind it, once robed in beautiful green, was striped for two or three miles with ravines deep and freshly torn. The meadow in front was covered with wet sand and rocks and the branches of green trees.

The traveller entered the house, and went through it. The doors were all ajar, the beds

breaks, a compensation for this terror comes in the enhanced beauty of the scene. Every cliff and peak, streaming with moisture, has the appearance of a mass of burnished silver, the foliage becomes a prism, and the rainbows seem to rise from one's feet.

From the Crawford House we go on to Fabyan's, and thence ascend Mount Washington. There are three ways of doing this—by the railroad, the carriage road, or afoot. The railway might have suggested Jules Verne's *Journey to the Moon*, and is such a

miracle of engineering that it will be a pity if any visitor to the mountains misses a ride over it.

The work of construction was begun in 1866, and was completed three years later. The route follows the Ammonoosuc Valley, and from the Fabyan House to the end of the friction rail is six and two-third miles. For two and a half miles the grade is two hundred and ninety feet to the mile, or one foot of perpendicular height to eighteen feet of horizontal distance. Besides the usual rails, there is a central rail of peculiar construction to receive the motive power, consisting of two bars of iron, with connecting cross-pieces placed four inches apart. A central cog-wheel on the locomotive plays into this rail, and secures a sure and steady mode of ascent and descent.

The locomotive, as it first comes out of the engine-house, has the appearance of being ready to fall over. The driving-wheel is geared into a smaller wheel, which connects directly with the crank, and four revolutions of the latter are required to make one of the driving-wheel. The locomotive

is not connected with the car, but simply pushes it up in the ascent, and allows it to follow gently in the descent. A wrought-iron dog constantly plays into notches on the driving-wheel, so that should any part of the machinery give way, the train may be immediately stopped. The car is also supplied with friction and atmospheric brakes. The seats are placed at an angle that brings them almost on a level in the ascent, and all of them face down the mountain. The time occupied on the journey up is about an hour and a half, the engine having to

MOUNT WASHINGTON.

MOUNT WASHINGTON CARRIAGE ROAD.

stop several times on the way to take in water. The fare, as I have stated, is three dollars up the mountain, three dollars down, or four dollars up and down on the same train.

The railway has by no means superseded the carriage road, which is still a favorite route to the summit of the mountain. For the first four miles it winds among a dense growth of forest trees, and thence passes through a ravine, and over the eastern side of the mountain. The grade is easy, and the road-bed excellent. Each turn discloses some new prospect—a wide valley, faintly green, with a brook or a river flashing through it; a deep dell, with a swaying sea of foliage; an overhanging cliff that seems to render impossible any further ascent; or a wonderful array of peaks.

It is singular that, according to the writer's impressions, a White Mountain summit gives a fairer idea of the immensity of space than the highest of the Rocky Mountain peaks. The height of the latter is so great that only the pinnacles surrounding

them have a distinct shape. All below is drowned in a yellow mistiness. But the downward glimpses you get in the ascent of Mount Washington reveal so varied an extent of country that it is possible to realize how great your altitude is. Now it is the valley of the Saco that opens before you, and then a wider reach still, with the peaks of Adams, Jefferson, and Madison wedged in, and the other ranges in the blue distance. From the highest of the Rocky Mountains the view unfolded resembles a desolate ocean; from the White Mountains it is an earthly paradise.

Before the construction of the road the ascent of the mountain was attended by many perils, and grim stories are told of people who have lost their lives in attempting to reach the top without guides. A pile of stones on the road marks the spot where a Miss Bourne died from exhaustion, in the presence of her uncle and cousin, one September night, twenty years ago. The party had started from the base in the afternoon, and were overtaken by night and fog. Under a shelving rock near by, the remains of an elderly gentleman, who had attempt-

JACOB'S LADDER, MOUNT WASHINGTON RAILWAY.

ed to ascend the mountain alone, were found two years later. His watch and some bank-bills in his vest pocket were uninjured, but, beyond these, nothing remained of him but his skeleton. A little farther below, an unfortunate Bostonian passed two nights and

few minutes before the departure of the stage for the summit is one calculated to impress an observer with an undue sense of the importance of the expedition that is about to be made. The passengers are all wondrously weather-wise, and among them

EAGLE CLIFF AND THE ECHO HOUSE.

days, in the snow and sleet of an October storm, without food or covering. No one who exercises any care, however, need be lost in the mountains, the carriage road and bridle-paths offering as distinct a way as the least experienced of travellers could desire. Nevertheless, the scene on the hotel portico a

is sure to be one who is an oracle of the mountains, with a surprising fund of anecdotes about the perils of the journey. You are regaled with numberless bear stories and thrilling descriptions of storms, until it seems that you are to enter a terrible and fatal land, on the brink of which all hope

must be left behind, instead of ascending by a smooth road the majestic peak that looms in the distance. But every one is in good spirits, as even the surliest misanthrope can not help being on a bright White Mountain morning. The young men puff away their impatience in clouds of cigar smoke. The ladies are wrapped up in shawls, which, however thick they are, can not imprison the exhilaration that is generally felt. A

THE FLUME, FRANCONIA RANGE.

crowd of natives stand by, sometimes quizzing the dresses of the tourists, but usually watching every movement with great awe and astonishment, although they may have seen the same things a hundred times before. That, by-the-way, is one of the distinctive characteristics of the New England bucolic—his unlimited capacity for wonderment. He is always curious to know; he is always surprised; but he is never thunder-struck. His greatest surprise is cloaked in a certain stolid reserve, and one surprise never prepares him for another.

By-and-by the coach appears, and when the passengers have taken their places, or, to speak more exactly, when they have wedged

themselves together, the driver cracks his whip, and the merry party are off for the summit.

The view from the top has been described by a graphic writer as a map of New England poetically expressed. If the day is clear, Monadnock may be seen, in a pale blue film, a hundred miles to the southwest; in the east is Mount Katahdin; in the north, Canada; and in the west, the Catskills. Nearer are the Franconia ridge, the twin peaks of Stratford Mountain, the radiant surface of Lake Winnipiseogee, Mounts Crawford and Kearsarge, and the Bartlett Hills. Could the eye reach so far, it might comprehend nearly six hundred miles of country, but its limit is in an area of about one hundred miles.

Descending Mount Washington, we take the stage to Bethlehem, ten miles from Fabyan's, and thence proceed to the Franconia range, where we "put up" at the Profile House, which is situated in a region of wonders. In the woods to the north of the hotel is the beautiful Echo Lake, which is of great depth and transparency, and is surrounded by densely wooded hills. A voice, a bugle blast, or a sound of any kind, is repeated from hill to hill with such marvelous distinctness and sweetness of intonation that Tennyson's exquisite lines are at once recalled to the listener's memory:

"O hark, O hear! how thin and clear,
And thinner, clearer, farther going!
O sweet and far from cliff and scar,
The horns of Elfiand faintly blowing!
Blow, let us hear the purple glens replying:
Blow, bugle; answer, echoes, dying, dying, dying."

Overhanging the hotel almost on the north is Eagle Cliff, an immense columnar crag separated from the crest of the mountain, and apparently held together by a thread; and as you walk down the road to the south of the hotel, a guide-board with the simple legend "Profile" painted upon it indicates that you are approaching that strange conformation of rock so familiar to every body through the means of photographs and engravings. The exercise of a little imagination often enables people to find the resemblance of the human form in a mountain, although without that imaginative effort no resemblance would be seen; but Profile Rock is really fashioned after the head of an old man, and the truth of the likeness makes it a most interesting sight.

We have exhausted our space, and yet we have not exhausted our subject; for to even enumerate all the "points of interest" in the White Mountains would occupy an entire Magazine. The angler, the lover of nature, or the prosaic business man can each find a tranquil charm in this region which will make the granite fastnesses of New Hampshire memorable to him for a lifetime.

THE GOLDEN TREASURES OF KURIUM.

PHŒNICIAN VASE, IN RED LUSTROUS POTTERY.

THIS Magazine, in the number for July, 1872, gave to the world the first account of the wonderful discoveries in Cyprus made by General Luigi P. di Cesnola, United States consul at Larnaca. No explorations in modern times have more widely or more justly attracted the attention of learned men in all countries. General Cesnola was thoroughly correct in the high estimate he placed on the results of his work, and his name stands inseparably connected with the introduction of the modern world to an acquaintance with Phœnician art and the childhood of Greek art, and of all art deriving its origin from Greece.

Our readers are well acquainted with the history of the first Cesnola discoveries. We illustrated them extensively, and they soon became known to the *savants* of Europe and America. The British Museum authorities, recognizing their unexampled importance in art history, desired to purchase them; but for some reason, hitherto unexplained, instead of accepting them at once, when car-

ried to England by the discoverer, chaffered with him about the price, which was ridiculously low, and while they were hesitating, were surprised to learn that on the western side of the Atlantic a museum had been founded which was ready to secure really valuable discoveries of this sort, and had, in fact, by the Atlantic cable, in swift American fashion, closed the purchase of the Cypriot collection from General Di Cesnola.

This, which was a great grief to European scholars, was a great joy to American scholars. The Metropolitan Museum of Art had the wisdom to commence its collections of illustrations of ancient art at the very beginning of all art, and to offer to its visitors and the American public facilities for studying what no European collections illustrate—the birth of art among civilized men, and its growth in the early years. Placed in the museum in Fourteenth Street, the Cesnola collection at once became the subject of curious examination by the thousands who look for curiosity alone, and of diligent study by many American and European scholars. Up to this time only a few fragmentary inscriptions in the Cypriot alphabet had been known, and scholars had hazarded only an occasional guess at the probable value of the characters in the alphabet. Now, however, numerous inscriptions were offered for study, and these in “squeezes” and photographic copies were furnished by the museum to public institutions and private students in all countries. An American scholar, Mr. I. H. Hall, was quick to decipher the unknown alphabet and to read the inscriptions, and his work was accepted as correct.

Previous to the Cesnola discoveries the origin of the ceramic art in Greece was involved in obscurity, the earliest decorations known being variously styled Doric, Carthaginian, Corinthian, or Egyptian.

American students found in the Cesnola collection abundant examples of the art in the early ages, which were recognized as Phœnician, because found in Phœnician tombs, and also by the aid of specimens on which were found Phœnician letters; and following these in order they saw the work influenced by the Egyptians who conquered Cyprus in the fifteenth century before Christ, and then established the succession of mixed art, now known as Egypto-Phœnician, which was the mother of the Greek. In effect the Cesnola collection proved conclusively that Greek art was born of the union of Egyptian with Phœnician.

Meantime, however, General Di Cesnola had returned to Cyprus and resumed his explorations. It was remarkable that among his first discoveries were so few works of

PHOENICIAN WINE PITCHER, WITH HUMAN FIGURES IN COLORS.

the best Greek period. All that he had found was archaic, except here and there a specimen of the later times, and countless lamps of Roman and Christian periods. Through the years 1874 and 1875 he continued a careful and systematic exploration of the island of Cyprus. The intense interest which attaches to his various discoveries can well be understood by those who value the history of the human race. He has embodied the story of his excavations in a book, to be published simultaneously by Murray in London and by Harper and Brothers in New York, which will relate the incidents attending these most remarkable and important unearthings of the men and the work of Phoenicia and Cyprus in the ages from long before Solomon down to the fifth century of the Christian era.

Again, in the spring of 1876, he closed his work, and gathered his collections, after handing over to the Sultan's representatives the portion which was reserved to the Porte for the Constantinople Museum. The collections were shipped to England. The general had been earnestly anxious that the results of his later explorations should be united with the former collection in the Metropolitan Museum of Art, forming one great illustration of Cypriot history. He had offered them to and urged them on the museum, but the trustees were without funds, and in the depressed condition of the country had no hope of an appeal to their friends.

It ought to be more generally known than it is that the Museum of Art is not a rich institution, except in the treasures of art which it possesses. Its affairs are conducted by trustees, who give it their personal attention without other compensation than the satisfaction they have in educating the public. The amount of daily labor bestowed on the museum by these gentlemen is equal to that required for the management of a large business establishment. The city of New York and the entire country owe to them a debt of gratitude, which should at least be paid by frequent visits to the museum, and by liberal contributions to its support. The museum is open free to the public on two days in each week, and it is a melancholy fact that a very large number of people take the free day for their visits who are perfectly able to pay the twenty-five cents on another day, which is the only source of revenue to the institution.

It was with great reluctance that Cesnola sent his collection to England, and offered it to European museums to purchase, in one lot. He declined many offers to break up the collection, and thus failed to receive, as he could have done, fully twice the amount at which he finally sold the whole.

The British Museum had now again the opportunity of purchasing, and the authorities were not slow to avail themselves of it. But the government was looking forward to possibilities of war, and would not approve the museum expenditure. At this moment

PHŒNICIAN CHARIOT IN STONE.

the Metropolitan Museum determined to make an appeal to its friends. It would have reduced the importance of their Cesnola collection to have another and possibly finer Cypriot collection in Europe. America could then no longer boast of possessing the best illustrations of early Greek art. Their appeal met with an instant and generous response. Within a few days the required money was subscribed by American patrons of art, ladies of wealth, culture, and public spirit leading the list, and again by telegraph the purchase was closed. The series of telegrams to and fro, all within a few hours of each other, was ended by one from General Cesnola, which showed his cheery good nature, and his love for America and the Museum of Art, in a hearty hurrah by Atlantic cable. The American public were not more rejoiced at the acquisition than was the enthusiastic general when it was settled that the Metropolitan Museum of Art was to possess the entire Cypriot collection. This is now added to the Cesnola collection in the museum in Fourteenth Street, quadrupling its value, and the whole forms a monument of the explorer of which he will not be ashamed, and to which archaeologists and artisans, ethnologists and historians, will make constant pilgrimages.

The later explorations were, like the former, carried on in various parts of the island of Cyprus. We shall not attempt to anticipate General Cesnola's book by any detailed account of his work. Now he sought under the ruins of a temple for the relics of ancient worship; now he excavated long rows of tombs, finding in them the dead men surrounded by more or less of the utensils and ornaments of their lives. He has opened more than ten thousand ancient graves in the island. The reader is not to suppose that the opening of an old tomb is merely the battering in of a door and the entering a vaulted chamber. Such it is in

Egypt, where the tomb is rock-hewn. But in Cyprus the tombs sought by Cesnola are mostly far below the surface of the ground, and invariably filled with earth, which has sifted through the rock walls in the long tremble of the earth rolling over the rough centuries. It is no slight work to reach, much less is it easy to empty, one of these tombs, especially with Cypriot labor and Cypriot tools. The latter are little

more than fingers to gather and baskets to carry the dirt.

But now and then the explorer, sitting in the sunshine and waiting for something to turn up, is rewarded by a sudden vision into the home of an old Greek or Phœnician, or

BOTTLE IN POTTERY.

into the heart of an ancient artist. For example, let the reader look at one of the vases which we illustrate. The vision of such a specimen is something startling to a lover of beautiful art. Modern potters have exhausted the brains of their designers in patterns for nozzles to

POTTERY BOTTLE.

pitchers and spouts to jugs, tea-pots, and vessels of various kinds. We have certainly seen a thousand different designs for this purpose, and one would imagine that every possibility of form had been put in use by modern factories. What must have been the delight of General Di Cesnola to see emerging from the dust of ages six of these water or wine bottles, now in the museum, of each of which the spout is the graceful and simple design of a figure standing on the curve of the bottle, holding in the hand a pitcher, which rests on the curve, and from which the water or the wine is poured out, as if the little figure poured it! In such a simple artistic thought the modern lover of the beautiful looks into the very soul of the old lover who possessed these bottles and admired them. In shape, in the simple arrangement of the dark lines which encircle the vases, and do not divert attention from the figure, the work is artistic.

Among the many vases added to the mu-

seum by the new purchase there are several others which are of importance in the history of Greek ceramic art. The Cypriot objects are of peculiar importance, because they illustrate local art for a period of more than two thousand years. No such facility of studying art history can be found in any other museum. In tracing the history of Greek pottery, it has been customary with scholars to class vases and articles on which figures in red appear upon a black background as of the best period, and about B.C. 400; vases with figures in black on red ground are supposed to have preceded these, and before them are placed the articles which have coarse red or yellow clay grounds, on which are arranged in bands figures of

MAN'S HAND IN POTTERY.

animals in red and black, with other ornamentations. These latter vases have been regarded as the beginning of artistic work in Greek pottery. They were called by some Doric, by others Corinthian, Carthaginian, and sometimes Egyptian. The human figure rarely appears in painting on any vases of this period.

The Kurium collection abounds in vases showing the progress of the art of decoration from a period more than 1500 B.C. The Egyptian influence brought the lotus flower and other Egyptian favorite patterns into Cyprus about 1400 B.C., and at this time the same influences affected the work and art of other Phœnician colonies. The wine pitcher with figures, which we illustrate in two views, is perhaps the oldest known specimen of pottery on which the human figure ap-

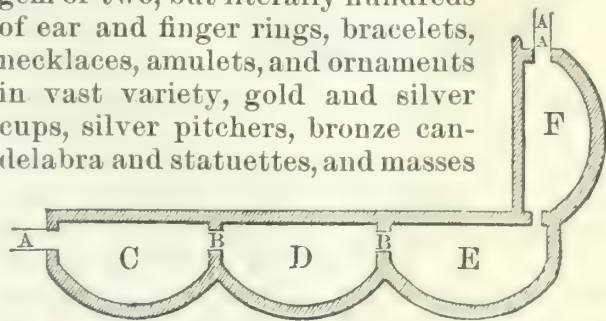

SILVER CUP—ENGRAVED AND REPOUSSE WORK.

pears painted in colors. It is here united with the Egyptian emblems, and is peculiarly interesting as showing the style of dress of the period. What that period is we can only hazard a guess, placing it, with numerous Cesnola vases on which the birds are executed in the same style, at a date approximating to 1000 B.C. The forms of many of the vases are so new and peculiar that they deserve the fullest illustration for the study of those who are interested in ceramic history.

Among the objects are some specimens of the ceramic work of the long centuries which are wonderfully fine. A bottle in the shape of a man sitting, with his head on his knees, asleep, is a superb piece of sculpture, unsurpassed by any specimen known. A pitcher in the shape of a lion, his open mouth the spout, is remarkable. An ancient chariot drawn by two horses, the wheels of pottery turning on the pottery axle, is a good and valuable specimen of unquestionable Phœnician character. There is a group of rude pottery representing two persons apparently washing clothes. A small bottle is in the shape of a dove with a woman's head. A man's hand in pottery is specially interesting, as it shows the fashion of loading the fingers with rings.

But the most wonderful portion of the collection, and that which will attract the attention of the most ordinary visitor as well as the most accomplished antiquarian, consists of the treasures of the temple of Kurium, which the explorer found in the treasure vaults of the temple, where they had lain concealed for twenty-five hundred years.

Gold, silver, alabaster, and bronze, the work of artists and artisans dead more than twenty-five centuries ago, are here gathered; not a few specimens, a ring or two, and a gem or two, but literally hundreds of ear and finger rings, bracelets, necklaces, amulets, and ornaments in vast variety, gold and silver cups, silver pitchers, bronze candelabra and statuettes, and masses

PLAN OF KURIUM TREASURE VAULTS.

A. Entrance passage first discovered.—B, B. Small doorways.—C. Gold room.—D. Silver room.—E. Alabaster and pottery room.—F. Bronze room.—A, A. Dark passage, explored only 130 feet.

of silver so corroded that the original forms can not be recognized.

The ancient city of Kurium, in the southwestern part of Cyprus, was a ruined heap when Greek cities that we now know more of were in their infancy. Cyprus lies nearest of all the Mediterranean islands to the

Phœnician coast, and the home of the second childhood of the human race (after the deluge) in the Euphrates Valley. It was early settled by the movement westward of the families of men, and its advance in knowledge, art, and general civilization was ap-

GOLD CUP.

parently more rapid than that of any other Phœnician colony. Long before the traditional period of the Trojan war, Cyprus had cities and commerce. The Phœnician colony became Egyptian for a while after the fifteenth century B.C. Kurium had probably been founded before the Egyptian conquest in 1442 B.C.; hence the accumulation of the art of many centuries in the treasuries of her temples.

General Cesnola found at Kurium only vast heaps of ruin. The city was built on a bluff three hundred feet in perpendicular height on three sides. The rock of the bluff was soft calcareous stone, and around the city, in the sides of the bluff, he found a terrace a hundred feet wide, cut and hollowed deep in the rock, in the sides of which were tombs. Among the ruins on the hill he identified the site of a temple, and here saw that explorers before him had made excavations, and abandoned them. He was induced to go deeper than they had, under the mosaic floor of the temple. At the depth of twenty feet he struck a dark passageway, which he penetrated till stopped by a low stone door. Bursting this, he found himself at the entrance of a series of vaulted rooms in the rock, of which we give a plan. The rooms were full of fine earth which had sifted through the rock walls.

The explorer did not know where he was, but he was standing at the doorway which leads the student of art into the hitherto unknown fields of investigation among the early Greeks and their Phœnician and Egyptian predecessors. The general soon perceived that the room which he was to enter was not a tomb. Commencing to remove the earth in the slow and careful manner

which the experienced excavator always practices, he began to find beautiful objects in gold lying in heaps on the floor of the vault. Then came the evidence that he had

this room opened another low door into a third vault, in which were found objects in alabaster, terra cotta, etc.; and beyond this vault, and at right angles with it, was a

fourth room, which contained objects in bronze, many of which were in very fair preservation. From this room a narrow passageway descended in the rock, which the general explored for 130 feet, and then abandoned, because of the foul air and the difficulty of proceeding.

And now to describe a few of the articles which composed the treasures of the Kurium temple, and which to-day gleam in the cabinets of the New York Mu-

seum of Art. The visitor who proposes to look at them for purposes of study must dismiss from his mind all notions of the early history of Greek art which books and muse-

EAR-RINGS.

1. Gold ear-ring.—2. Gold ear-ring (bunch of fruit).—3, 4, 5, 6, 7, 8. Gold ear-rings in crescent form.—9. Gold ear-ring worn by men.

opened the treasure chambers of the temple. Twenty-five hundred years ago the priests in the temple were suddenly alarmed by the rush of a besieging army over or through the lofty walls of Kurium. In the wild haste of the unexpected attack, they swept from altars and shrines, where they were exposed, the votive offerings of generations of worshipers, hastened down the dark passage, and threw them, heaps on heaps, into the treasury vault, closed the stone door, and doubtless also closed the secret entrance to the passageway. The enemy came in, and hewed down the priests before the altars, or carried them away captive to Asia. None was left who knew the secret of the vault. The temple was desecrated, robbed, destroyed, its walls and columns hurled

AGATE FROM NECKLACE, GRANULATED GOLD MOUNTING.

down in hideous ruin, and for twenty-five centuries the gold of the old Phœnician and Egyptian and Greek worshipers lay dark and unknown in the vaulted chamber. From the gold chamber a low doorway, two feet seven inches high, opened into the next vault, which was the silver room. Black, corroded, unsightly as it is, this treasure was not less important than the gold. For ancient silver objects are very rare, especially cups and vases. There were piles of these corroded into masses. But a considerable number were perfect, and are of the greatest archaeological importance. From

GOLD EAR-RING WITH EMERALDS AND OTHER STONES.

ums have heretofore given him. The temple was destroyed and the treasure was buried for us some six hundred years before Christ. Yet here are the most exquisite works of artists in gold, of engravers on precious stones and on metals. No modern work in jewelry is any finer in design or more exquisite in delicacy of execution than are a large number of these articles.

Let us begin with a silver cup, which must have belonged to a man of finished taste, as it was the work of an artist who has never been surpassed. Our illustration is reduced from the size of the cup, which is seven inches in diameter. The style of the designs is Assyrian, but there is Egyptian thought pervading the work, and numerous Egyptian hieroglyphs in minute oblong in-

PHŒNICIAN GOLD EAR-RINGS AND ENGRAVED PENDANT.

ber of these rings, which were massive spiral twists, sometimes probably pinching the lobe of the ear, but in other cases attached in an unknown way, possibly by piercing a large hole through the ear. One end of the ring seems to have stood up perpendicular before the ear, and on this end an ornament was often fitted by a gold cap. Many of the

rings in the collection have the ornaments, and some of these are among the most superb works of the goldsmith's art. A massive pair with two winged lions on each is a marvelous work, which no artist of Europe or America could to-day surpass, either in beauty of design or skill of workmanship.

Instead of describing the large variety of ear-rings, we refer the reader to our illustrations of a number of them. It can not fail to strike the observer that the crescent form was a favorite, and many in this form are evidently Phœnician of early date. Simple crescents of plain gold are numerous. After these come plain crescents with raised edges and various wire ornamentations. Then enamels beautify the crescent. Precious stones are placed on them, or form pendants. Then the crescent swells into a solid gold form. Then the hollow gold is shaped in lobes with charming surface ornaments. Then we see agates cut in the new-moon form, and set in gold with delicious granulated patterns. There is no end to the varieties of ear-rings. There are bunches of fruit, rosettes, plaques with impressed images, ear-rings with pendants in every form, and ear-rings without pendants, in the modern form, where a small ornament fits close on the lobe of the ear.

GOLD EAR-RING WITH PENDANTS, ALL IN FILIGREE.

We may well wonder, as we

look at the variety and beauty of the finger-rings, whether this is not all an imagination, a deception, and whether these gems are not things of our own day. Many of them are as perfect as if bought to-day on Broadway.

The Egyptian scarabæus is the most frequent form of the stone in rings, but others have emeralds, carbuncles, beryls, sards, agates, enamels, and glass. There is a fine ring whose exquisite setting consists of two figures of a deity bending backward, and with uplifted hands holding the box or chest in which the stone, a brilliant amethyst, is placed. This inclosure of the stone in a box or receiver, more or less ornamented, is one of the most frequently repeated designs. It is familiar to those who have examined Etruscan work, and here is, apparently, the school from which the Etruscans learned many of their much-admired designs in metal-work.

Another very beautiful ring, which we illustrate, holds three stones in its curious form.

Many of the rings were evidently used as signets, but not worn on the finger. Their setting is massive, and shaped more like the modern idea for a pendant seal. One of these, of which we present an il-

lustration, is of solid gold, holding a scarabæus in clear carnelian, on which is engraved the Egyptian hawk of Osiris, crowned, and holding the flail of power. A large number of the seals are held in silver handles too cumbersome to have been worn on the person. An illustration will show the form of these rings. Many finger-rings are of plain gold, and many others are engraved with letters, figures, and devices. One of the most delicious pieces of work in the whole collection is a ring, which we illustrate, of which the top is a rosette in the most delicate gold-work. But this rosette covers an empty box, in which, perhaps, was once some precious object, an engraved stone, or a portrait, or something too rare and delicate for the common eye, and the rosette was a lid, opening and closing above the gem.

But while the rings are beautiful and wonderful as works of art, the engraved gems which they hold are vastly more beautiful and astonishing. The students of glyptic art are, by this great discovery, compelled to re-

GOLD EAR-RINGS WITH ENAMEL DROPS.

GOLD EAR-RINGS.

vise their present theory of the origin and rise of this art in Greece. One of these old stones alone, found in a temple which was destroyed twenty-five hundred years ago, would serve to overthrow a whole library of works based on former discoveries. What, then, is the astonishment of those who have heretofore supposed the art rude and archaic in the fifth century before Christ to find before that works equal to those of the best period!

Hitherto the oldest known engraved stones of Greek workmanship have been considered to be those of the sixth or fifth century B.C. The Berlin Museum has a sard engraved with the death of the Spartan Othryades, who killed himself on the battle-field, of which he was ashamed to be the sole survivor, in the sixth century B.C. This stone is by many scholars regarded as the oldest known Greek gem. In describing it, they are accustomed to call it flat, hard, without grace, "in the oldest Greek style." The school of Greek art is generally divided into three periods: 1, that from Theodorus of

Samos, 560 B.C., to Alexander the Great; 2, from Alexander to Augustus Cæsar; 3, after Augustus. The Phœnicians and Egyptians have not been supposed to possess the art of engraving hard stones with much skill. But this collection contains an extensive series of scarabæi and scaraboid gems, and other stones, in styles of progressive art, which point to a period far older than has been supposed for the practice of great skill in the glyptic art among the Phœnicians, as well as the early Greeks. One of the first suggestions from this new mass of material is that the Phœnicians were the instructors of the Etruscans. Aristotle, indeed, gives the name of Mnesarchus as a gem engraver at Samos before 570 B.C., and says he was from Tyre, a Phœnician city. He is perhaps the oldest artist in this work of whom we have any record. There are here many admirable gems, of Egyptian and Phœnician subjects, in archaic settings, or in heavy silver crescent-shaped handles,

ENGRAVED SARD IN
A SILVER RING.

which we are compelled to assign to periods much beyond 570 B.C. An Egyptian scarabæus of the period of Thothmes III., 1440 B.C., is set in the same style of silver handle with many engraved stones of fine work; but this was probably regarded as an antique gem by its possessor, who had it thus set.

GOLD RING WITH
STONE.

An engraving on wood can give but a poor idea of the delicacy of work on a gem; but the stones which we illustrate will show the reader that the age of the Berlin sard was an age of decadence in art, or the stone was the work of a poor engraver. Before the death of Othryades there were gem engravers in the Greek cities of Cyprus who have scarcely been surpassed in later periods. It is noteworthy that the female figure which we illustrate, engraved on a dark sard, has no polish in the interior, and thus the theory that all Greek gems are characterized by a dull polish is overthrown. We find other gems in which parts are polished and other parts, such as the hair, left unpolished. The Cesnola collection makes it necessary to revise the text-books and to begin again the study of Greek art.

"If they could only speak!" said a lady in our hearing the other day, as she leaned over the case containing some of these superb works of art. They do speak in the clearest tones, and many understand their language. More will learn it from the education of the Museum of Art. These rings utter intelligent language in every gleam of their gold and every form engraved on their gems. They tell the most ordinary mind of the luxury, the refinement, the civilization, of the men and women of twenty-five cen-

GOLD FINGER-RING WITH
ROSETTE COVERING AN
EMPTY BOX.

GOLD RING WITH
THREE STONES.

turies ago. They tell the lover of art not alone that there were artists in those days, but that there were lovers of art as well. The gems were engraved for lovers of gems. The average Cypriot gentleman who wore on his finger the gem which we copy, illustrating the carrying off of Orithyia, daughter of the Athenian king, by Boreas, perhaps the most superb work of early Greek art hitherto known, appreciated it more than the aver-

GOLD FINGER-RING,
ENGRAVED EMERALD.

age French, English, or American gentleman of our day. It may be humiliating to believe it, but it is nevertheless true, that the art has disappeared. There is not a living engraver of gems above mediocrity, and the reason is very simple and plain—that the men and women of our day do not appreciate the art, and do not, therefore, encourage its pursuit. If the wealthy lover of paintings or of statuary were to be asked to pay a thousand dollars for an engraved stone by a modern artist, however exquisite the work, he would think it an insane idea. Nevertheless, there is no statue of modern times better worth a thousand dollars than is the Cupid, of Solon, engraved on a sard which we know of; and the ability bestowed on it by the artist was fully equal to that of Story on the Cleopatra.

Besides the complete necklaces, there are many fragments of necklaces and pendants, which were either attached to necklaces, or worn as ladies now wear lockets on ribbons. One of the most remarkable of these pendants is engraved in high relief on a heavy piece of gold, and represents one of the non-descript deities or genii, familiar in Assyrian sculptures, crouching rather than standing, in front face, the four legs being entirely engraved in relief. Other pendants are of agate in forms of bottles, and yet others are

AGATE PENDANT,
GOLD MOUNTING.

GOLD PENDANT.

stones in settings of gold. There are parts of a necklace in long agates, with gold caps at the ends, on which the decoration is in minute globes of gold, commonly called granulated-work. This style of work, known in Etruscan jewelry, characterizes much of this ancient Greek work, and is a puzzle to modern goldsmiths. We illustrate a gold ornament—a round brooch or amulet—for the sake of describing this remarkable style of work. The surface of this object presents to the eye the appearance of a gold disk stamped in a die, or crossed by numerous fine wires at right angles with each other. On examining it with the magnifying-glass, however, it is found that the effect is produced by minute globes of gold, each one perfectly round and smooth, soldered on the surface in exact lines, each globe touching the next. There are on the

surface of this small object, a little over an inch in diameter, upward of nine hundred of these globes. How were they made, and how were they soldered on in such absolutely true lines? The ablest gold-workers in America (and that is now to say the ablest in the world) tell us that they can not explain it.

Another device of those Greek makers of the beautiful, which is new to modern artists, is in the use of twisted gold wire for ornaments. The moderns draw their wire round, and twist it into cable form, fine or coarse, as they please. But these old Greeks used square wire, which, in twisting, produced facet-like points and double curves, so that an exquisite effect was gotten from even the finest wires, such as the round wire could never produce.

It is not unknown to most readers that it was customary with the Greeks in early times to place over the faces of the dead thin plates of gold, one over the mouth, and another sometimes over the forehead. These are always of thin gold, and General

GOLD PENDANT, GRANULATED SURFACE.

Cesnola has, of course, found numbers of them in the tombs. The form of one of the diadems for the forehead is shown in our illustration. This, like many of the others in the collection, is ornamented with a scroll pattern, produced by pressure from a die. The wreath of which we give the half was part of the treasure of the Kurium temple, and when found the gold leaves which compose it were separate. They were probably sewed on a ribbon, forming a wreath for the head of a statue in the temple, or possibly they were originally intended for a mortuary decoration. The restoration is conjectural. Each leaf is a plate of gold, stamped with veins like a natural leaf.

There is scarcely any object in the collection more noteworthy than a superb vinaigrette of rock-crystal, with a golden lining to the neck, and a crystal cover set in beautiful gold-work, attached by a chain to one of the ears of the bottle. We call it a vinaigrette for the reason that it looks as if fresh from a modern jeweler, and it is one of the safest rules in antiquarian research to ask, "What would we call that, and for what purpose would we use it, if it were modern?" Men and women have been very much alike in all ages; and if one doubts this, the study of such a collection will soon prove convincing. Else why those rows on rows of earrings, of patterns so much in esteem now that it seems incredible that these are old; those finger-rings with pendants, a favorite style not many years ago; those handy shawl-pins of silver, closing with a spring, and looking as if lost last year from ladies' heavy wraps?

We have lingered so long among the gold that we have little time to look at the silver and bronze; and yet, if there were nothing else in the collection, these would abundantly repay the art student for many visits to the museum. The silver vault of the temple was very rich. The silver is here, but the gleam and glitter have departed, and it is all black with corrosion. There are many heavy silver cups and pitchers. There are scores of massive silver bracelets—massive in the true sense, for many of these bracelets must weigh more than half a pound each, and there are some that would certainly go near a pound in weight. The trustees have exhibited only a part of the silver, for we are told that great quantities were in fragments, and they exhibit some in masses of silver plates corroded together, looking more like silver ore than silver. Kurium must have grown rich in this metal. Some of the heavy bracelets, which are coils of thick round silver bars, have gold caps on the ends of the coils. Others flatten out into serpents'

heads curiously engraved. Under the corrosion on many of the cups can be traced the remains of delicate engraving. And there are some things here in silver which,

GOLD MORTUARY DIADEM.

were they perfect, would ravish the eyes of our lady readers, and over which some of them who love old art will bend in delighted rapture. These are silver belts worn by the ladies of Cyprus in the ancient years. Within the past year or two a fashion has prevailed among ladies in America of wearing broad metallic belts of silver or other metal. Could an American lady possess one of these belts of Cypriot make in its original freshness, or its fac-simile, she would be very

happy. Delicately engraved in patterns, inlaid or overlaid with gold, they are exceedingly beautiful. From a brief examination of some of these, we

HALF OF A GOLD WREATH.

are struck with the idea that when they were made silver was more precious than gold, and that the gold which shines out of them was used for color to set off the beautiful patterns in silver. Do not imagine, dear madam, from our account that you will see a shining silver belt, the zone of an ancient Venus, when you visit the museum. But you will see rows of rough, dark, ashy-looking fragments, the glow of the ancient splendor showing through the decay. The slender form of beauty, once surrounded by this belt of rare and delicate workmanship, which retains to-day the contour of the form it encircled, is dust of the old island of Cyprus, and the metal zone is almost dust as well.

The bronze, like the gold and silver, shows plainly that the age before the sixth century of the pre-Christian times was one of noble art. There is something wonderful in the boldness of this workmanship, and splendor is mingled with the boldness.

Massive caldrons, that may have served the cooking purposes of the priests, tell us that men were hungry in old days. The hoofs of deer, superbly produced, once sus-

ROCK-CRYSTAL
VINAIGRETTE.

GOLD PENDANT, GRANULATED DECORATION; CENTRAL STONE REPRESENTING AN EYE.

tained the tripods in the temple. Innumerable standards, ornamented with the leaves of the lotus bud, held the lamps that lit the temple. Sacrificial vessels in silver and bronze served the offerings to Astarte.

These golden relics of the highest art, these exquisite forms in pottery, in silver, and in bronze, reveal to the modern world the error of those who have supposed that seven centuries before Christ was the iron age of Grecian art. For it must be borne in mind that the treasures of Kurium were the accumulation of centuries, and that, in studying them, we begin where heretofore we have placed the semi-barbarous period,

GOLD BRACELET, CLOISONNÉ ENAMEL.

"shadowing with wings." Assyria was the land of images representing force, power, strength, with wings. Who shall say how much of this mysterious symbolism came from the traditions of the earliest ages?

We ought not to close this sketch without alluding to the unexampled modesty of General Di Cesnola. The discovery of a Greek tomb containing bodies ornamented with jewelry, their faces covered with the thin gold plates which we have described, has always been regarded as an event, and other explorers have become famous by the widely published accounts of such discoveries. Cesnola, with true scientific zeal and motive, seeking, not curious treasure, but materials for history, has worked quietly

PARTS OF A LADY'S SILVER BELT.

and go back into the unknown ages. It was not so long before this date that Hiram the Phœnician helped Solomon to build the temple in Jerusalem. Among the Kurium treasures there are doubtless many which are the work of contemporaries of Solomon. Egypt had long before this time excelled in civilization. Phœnicia had derived from Assyria some knowledge of useful art, and had improved upon it. When the Egyptians brought to the Phœnicians their cultivation, and accepted from them the Assyrian ideas of beauty and symbolism, the union of the two produced the works of high art which have been admired in all subsequent ages.

Let the reader look again for a moment, before he leaves the collection, at the strange forms of winged lions, winged gods, winged scarabs, which abound in silver and gold and gems. Whence came these strange, weird, marvelous fancies of men in an age equal to our own in power of intellect and power of execution? Egypt was the land

and waited patiently for the accomplishment of his objects. One long case in the museum contains articles in gold not found in the Kurium treasure vaults, but in various tombs in Cyprus, face pieces and diadems of the dead, bracelets, ear-rings, and finger-rings, engraved gems, hundreds of objects, which alone surpass all other late discoveries of this class. The Kurium treasure is the most valuable and wonderful single discovery of ancient art ever made. The discoverer might well have been overpowered with the event. Instead, however, of publishing it to the world, he contented himself with making it the subject of a private report to the Museum of Art, and it was not till he had finished his work in Cyprus and was prepared to submit its results to the scientific world that the public heard of the opening of the Kurium vaults. From such a workman in antiquarian fields we may well expect a book of remarkable interest and value.

OWL'S HEAD LIGHT.

A NEW WATERING-PLACE.

"The port ;
The strange, old-fashioned, silent town ;
The light-house ; the dismantled fort ;
The wooden houses, quaint and brown."

THEY have found it at last. At last—and echo answers, *Alas!*

Is it not enough that California, and the Rocky Mountains, and the islands of the Great Lakes, and the forests of Florida have been added to the number of summer resorts, that the Southern springs are again accessible to the whole nation, and that all Europe is an open play-ground for every American? Why could they not have left this one little nook to its natural loneliness of situation and its traditional stagnation of affairs?

Years ago, when a few of the inhabitants, made desperate by lack of business, suggested the policy of holding out lures for summer travellers, a veteran citizen protested. "No," said he; "we don't want the world coming here. Castine is wicked enough as it is!" Those of us who, without subscribing to the good deacon's professional fears, sympathized with his desire for continued quiet, consoled ourselves with the hope that the more progressive spirits in our midst would not be able to carry their theories into practice, and events favored our wishes.

But more than once, before our seclusion was actually invaded, we were startled by the near approach of the enemy in force. Mrs. Stowe wrote her *Pearl of Orr's Island*, and its fascinating descriptions of sheltered cove and pine forest and wide expanse of sun-lit sea answered so well to the scenes in which we daily moved that we feared the crowd of eager tourists, not content with the beauties of Casco Bay, might suspect the existence of still sweet-

er surprises of nature farther down the coast, and push their investigations accordingly. But the tidal wave of fashion did not reach our isolated shore, and soon retreated, leaving us still undisturbed.

Then Mr. Wasson published his notes of a voyage to Labrador, wherein we read that the glory of the northern mountains, under a northern sky, was such as he had never seen elsewhere, *excepting on Camden Hills at sunset*; and we looked across the bay at those "purple hills of paradise," as *he* had looked in boyhood from Brooksville, and knew how beautiful Labrador must be, and feared that the great world would be curious to test the value of the author's comparison. But this danger also passed by.

Next came the rush for the wild region of Mount Desert, and steamers bound thither actually touched at our wharves on the way; but the greater absorbed the less in the eyes of the expectant passengers, and we breathed more freely when we saw that there was no stir upon the crowded decks as the gangway was lowered for communication with the shore.

"CASTINE IS WICKED ENOUGH AS IT IS!"

NORMAL SCHOOL, FROM THE OLD FORT.

Not that our village was ever entirely void of summer visitors. Far from it. In almost every one of its roomy, old-fashioned houses the "spare chamber" was annually opened for the reception of beloved relatives or faithful friends, who, coming from the distant West or the sultry South, or from busy cities less remote, had looked forward through all the intervening months to the cool tranquillity awaiting them in this enchanted spot. With these came now and then some belle of the ball-room, to forget for a time her coquetries, and grow fresh and sincere among the gentle influences of nature. Sons who had gone away to seek knowledge or a fortune came back for a long holiday, bringing favorite comrades to share their sports; and hither strayed the tired scholar, the dreamy poet, the keen-eyed artist, in search of refreshment and inspiration. The captain of the daily packet was often seen escorting a group of strangers to the one little tavern on the hill; and on Sundays, during the months of June, July, and August, an unwonted air of fashion pervaded the congregations of the old white meeting-house.

It was not an occasional spasmodic outbreak of local enterprise that alarmed us. We know that the ship-yards are empty and

grass-grown, that factories can never flourish in this lonely region, and that Nature, as though in sympathy with her worshipers, has made her one practical gift—the slate rocks on Holbrook's Island—inaccessible as a quarry. Nor when, during the late war, a new battery arose on the site of the old "half-moon fort," and government vessels appeared in our waters to inspect the national defenses, did we apprehend any lasting disturbance of our quiet. It was not the entrance of the rebels by way of the Provinces that we dreaded. We knew well that Leisure and the Love of Beauty were the enemies we had to fear.

But when a Normal School was assigned to Castine, our last hope of continued repose was destroyed. "Behold," said we, "these two or three hundred youths and maidens, rejoicing in the full spring-tide of sentiment; these teachers with trained powers of observation and matured thoughts: not only is their coming in itself an invasion of our solitude, but they can not be expected

CAMDEN HILLS.

to keep the charms of their temporary residence a secret from the rest of the world. Lover and friend will they draw after them, and bring their acquaintance into our sight!"

Hence, we accepted it as quite in the natural order of things that, directly after the rise of a temple of learning in our midst, should come a demand for hotels and all the detestable paraphernalia of a fashionable summer resort.

And why should we object?

Because this influx means new wharves and a daily steamboat—perhaps that worst desecration of forest sanctuaries, a railroad; it means the cutting up of our commons into town lots, the removal of primeval boulders, and the destruction of groves of pine and fir; it means the dotting of our pastures with mushroom cottages, and the turning of our spacious homes into hotels and boarding-houses; it means a carriage-way to the Fort and the Bluff, instead of the narrow winding foot-path of the good old times; it means a ginger-beer shop on Light-house Head and bathing-machines

come. He has won a passport and the freedom of the town through his "Fire of Drift-Wood," which, though immortalizing another locality of the coast, is a charming picture of Castine, as well as an echo of many a sigh that has escaped from dreamers over evening fires in Castine homes.

And there are others whose appreciation of the romance of life upon the shores of "the mournful and misty Atlantic" entitles them to a warm welcome. If Mrs. Stowe would visit us, that trim little yacht, the *Sally Kittredge*, should be placed at her disposal for explorations amid the ocean haunts she describes so well; Whittier should wander undisturbed upon the wooded height of Block-house Point; and Celia Thaxter should be lodged in the neat parlor of the Light-house Cottage.

But that a host of aimless, thoughtless people should pour in among us, only because they have exhausted every other place; should, so to speak, trample down our one bit of greensward, when there are acres of verdure kept mown for them elsewhere;

CASTINE.

at Hatch's Point; it means daily promenades to Trask's Rock, a constant succession of picnics at Gray's, and mammoth chowder parties on Holbrook's Island.

That is why—and reason enough for mourning!

"Let the young people enjoy themselves?"

That's just where it is! They could enjoy themselves exactly as well at Saratoga, or Gloucester, or the White Mountains, as here. Given a company of young people, with the two sexes in due proportion, and they will be happy any where; while as for those whom years and disappointments have taught to find solace in the beauties of nature, and for whom the mournful loveliness of this retreat may have a peculiar charm, they can find the same characteristics, with still grander features of landscape, at Mount Desert, which is professedly given up to tourists; whereas we must live here all the year round, and would prefer not to be first robbed of our own summer romance, and then haunted all winter by the ghosts of alien pleasures.

We are willing that Longfellow should

should, through their senseless noises during a month of midsummer, scare away forever the naiads and dryads of our tiny forest—this is our grievance!

There is the Cobb house already transformed into the "Acadian Hotel." What a profanation to those who can remember the cheerful hospitality that once warmed its great square chambers and broad halls! Better far the succeeding occupancy of chance tenants than this final degradation; for then there was always the possibility that some son of the soil, grown rich upon the sea or in a more enterprising section of our wide country, would come back to buy the stately mansion, and restore its sunken terraces and neglected shrubbery to their former beauty. But the most that we can expect now is a croquet ground for the morning flirtations of the city belles and beaux, and perhaps an arbor for the indulgence of their moonlight sentimentalities.

Nor is the mischief likely to stop with the modernizing of this more central relic of by-gone social prosperity. One of these days we shall hear that the rich carvings

HACKS AT MAIN WHARF.

and panelings of the Ellis house have been given over to the scrubbing-brushes of hotel chamber-maids and the jackknives of nomadic children; and that the noble old dancing hall of the Hooke house has been partitioned off into ten-by-twelve bedrooms for bachelor guests.

Already two hacks are established on the main wharf, and after every arrival of the steamer our tiny peninsula echoes to the crack of the driver's whip and the rattle of wheels upon the graveled streets, as the new-comers are whirled up to the hotel entrance, or dropped more quietly at the various private houses which have opened their doors to city boarders. Time was when we rivaled Venice in the use of the sea as a highway, and in the consequent silence of our streets. Those were the blessed days when the rolling of a carriage was mistaken for thunder, and the creaking of an infrequent hay cart or wood rack was sufficiently startling to send a whole family to the windows. Within the last few years we have accustomed ourselves to the daily passing up and down Main Street of the slow white horse and covered chaise of our octogenarian deacon, and we are disposed to resent the appearance of the hacks as a trespass upon his right of way. But this is only one of many matters in which we must

suffer intrusion; well for us if we are not in every respect driven to the wall, or forced to retire altogether before the invading crowd!

However, in some things we can hold our own. Our history belongs to us—no one else will ever care for its *minutiæ* as we do.

The government of the Baron de St. Castin was so entirely local in its influence that the details of his romantic sojourn are not widely known; and the part which this little community played in the wars with European powers has been overlooked in the apparently more important events which occurred in localities less remote from the great centres of strife.

Many of our guests will have come fresh from Old-World travels, their memories filled with historical associations set in the framework of the very scenes in which the events took place. Others, narrowed by continual residence in one section of their native country, will not allow that any story of the past can equal in interest their own local traditions; and, to all alike, a lively remembrance of the recent war of emancipation will throw into the shade the half-forgotten sufferings of colonial times and the more familiar vicissitudes of the struggle for independence. To those who have visited Versailles and Fontainebleau, what is it that more than

two hundred years ago a French nobleman, weary of the world, sought a retreat in the Acadian forest, married an Indian maiden, and spent the rest of his life among the gentle and unspoiled Tarrantines?

Who that has seen the magnificent cathedrals, the secluded monasteries, the picturesque way-side shrines, which attest the power and influ-

THE DEACON'S CHAISE.

HOLBROOK'S ISLAND.

ence of the Romish Church upon its native ground, will care to know that here was once a tiny chapel dedicated to "Our Lady of Holy Hope," and that Jesuit missionaries were among the first arrivals at the new settlement?

The wanderers over European battle-fields will pass unheeding the wooded hill which contains the bones of the few score victims of the Revolution in this remote and thinly peopled region; and though they may listen with interest to our standard boast that the *Great Eastern* itself could come up to our very wharves and turn around without difficulty or danger, they are not likely to hear how a hostile British fleet once rode at anchor in the harbor, and British troops twice held possession of the town.

What am I saying? Every American is patriotic, whatever else he or she may be; and no degree of foreign association or amount of individual experience can make our countrymen and country-women insensible to the thrilling romance of early American history.

The faint depression in the soil which still designates the site of Castin's fort is not so picturesque a landmark of the past as are the ruined castles on the Rhine; but our summer guests will trace the outlines with eager eyes, and call up many a vision of the courtly nobleman and his dusky bride, as they pick out shells from the embankment facing the sea, or wander along the shore at low tide in the hope of catching a glimpse of the sunken pier which formed the landing for the baron's boats. The ruined fort on the hill will be, of course, the favorite promenade and lounging-place of the strangers; nor will they forget that Sir John Moore,

the immortal hero of Charles Wolfe's celebrated poem,

"Not a drum was heard, not a funeral note,"

began in this spot the military career which terminated so early and so brilliantly in Spain. Never will they pass Trask's Rock without a thought of the brave little fifer-boy who, seated behind the immense boulder, cheered his comrades to the attack with his shrill music while the bullets whistled around his head. They will pause before the white house in Main Street where Talleyrand once lodged, and will welcome any chance that gives them admission to the mansion which still bears in one of its floors the marks of the boot heels of the British officers who danced there at balls given during the foreign occupation. To them the Castine relics will be, as they are to us, objects of deep interest. They will study the curious coins, and muse over the disfigured copper tablet upon which the Capuchin friar Leo recorded the date of the foundation of a chapel which perished long ago and left

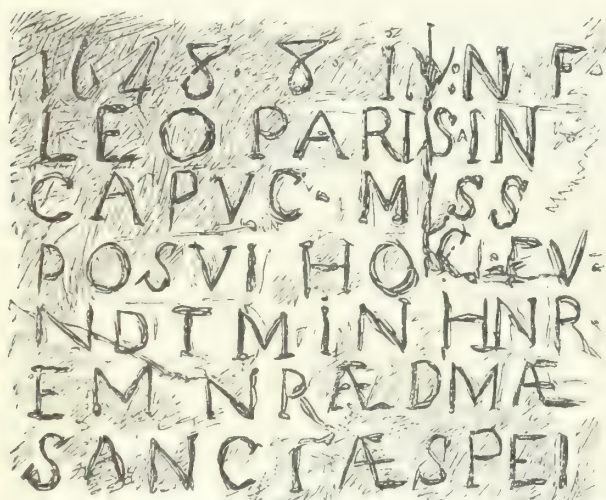

AN OLD WHARF.

OLD CASTINE COINS.

no trace of its location. They will smile at the characteristic boast of an English officer, traced with a diamond upon a window-pane during the Revolutionary war—a representation of the British flag with the “Stars and Stripes” underneath, upside down, and the words, “Yankee Doodle upset!” Nor will it be to their discredit if those among them who are familiar with

COPPER-PLATE WITH CAPUCHIN FRIAR'S INSCRIPTION.
[SEE PAGE 349.]

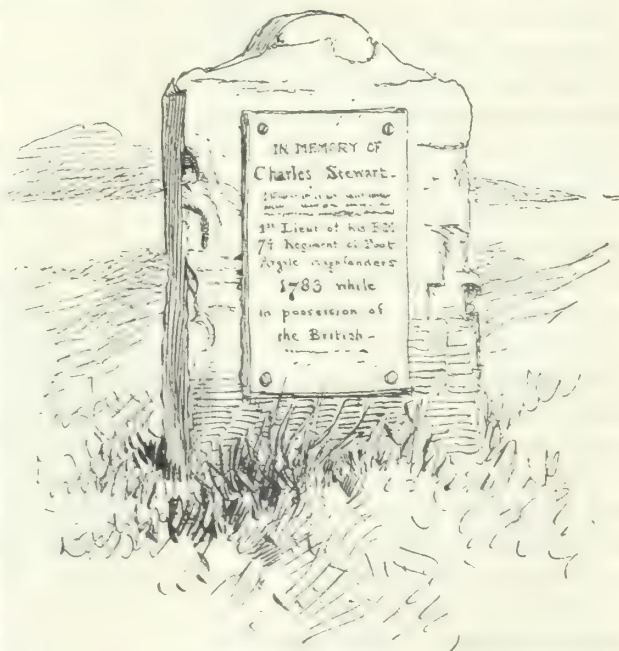

the sculptures of the Louvre and the Vatican should refuse the meed of admiration to “Cotton’s Head,” the one original specimen of plastic art of which Castine can boast.

Thus, with strangers navigating our waters, occupying our houses, enjoying our scenery, and sympathizing with our history, what is there left to us for our exclusive possession? Nothing but the associations of our immediate past; the familiar household events of our own and the preceding generation; the incidents of daily life which bring us near to one another; the bitterness which each heart knoweth for itself, and the joy with which a stranger doth not intermeddle.

The frolics of a few summer days can not endear this region so deeply to visitors as do the reminiscences of years to us who remain; and though many a heart may date the love of a lifetime from a chance meeting in this romantic spot, still the charm of scenery so in harmony with the tender sentiment can not make itself felt to these as

to young lovers of our community, who recognize in their own sweetly troublous experiences an echo and repetition of the story of their elders in the midst of the same familiar scenes. We too find a romantic interest in connecting our past with that of the hero of Corunna; but nearer to our hearts is the memory of our centenarian soldier who fought against Sir John Moore and his comrades, and having lived to see the republic he helped to create emerge triumphant and undivided from the rebellion, died in peace and was buried in the flag he had defended in his youth and honored all his days; while we have among us men still young who, no less patriotic than old Hutchings, have suffered more than he ever knew of the horrors of war in their experiences of battle-fields.

That distant inclosure to the eastward, conspicuous by its dark fir-trees and white monuments, and famous for its charming views of bay and islands, will doubtless be the boundary of many a summer’s ramble. But though visitors may be arrested by the kindly tribute to a fallen foe, “the earliest occupant of this mansion of the dead,” who was laid here in 1783, and may pause to read the name of a well-beloved citizen, the only one among the victims of the recent war who had the happiness to die at home—

GRAVE OF THE FALLEN FOE.

though they may be struck by some pathetic epitaph upon a little child, or by the frequency of the mournful record, "Lost at sea"—they can never know the home-like feeling which soothes while it saddens us as we enter that burial-place where so many of our loved ones are lying, and where we expect one day to take our places. Who of us ever forgets to glance at the solitary mound in the corner by the gate?—the grave of the young Spanish sailor, Carlos de Eschanagoucias, who, straying to our bleak coast in his boyhood, found a home among our people for the few remaining years of his short life. What a contrast must our snowy hills and stunted evergreens have been to the sunny plains and luxuriant vegetation of his native land! How many thoughts in which wife and children could not share must have imbibed the slow

Leaving the lonely grave-yard and returning to the homes and haunts of the living, how many tender and sad and happy and mirthful associations are for us connected with this little cluster of comfortable dwellings! Strangers may single out the mansions dating from colonial days; but they know nothing of the family histories of these any more than of the modern habitations. If, perchance, they find temporary lodgment in the parlors or spare chambers of a Castine home, still they do not penetrate to all the treasures which have been accumulating for generations under its ample roof.

There is the garret, not full of moth-eaten refuse and festooned with cobwebs, as are the garrets of romancers, but clean, light, and airy, the favorite play-room of the little folks, and the frequent resort of their

MILL ON GOOSE CREEK.

decline of this waif of a Southern race! One might well say that his fervid blood and passionate nature were gradually frozen by the cold climate and methodical ways of this Puritan settlement.

Passing along the narrow walks which separate the rows of head-stones, we can picture to ourselves many a face now hid

"under the coffin lid,"

and call to mind the various circumstances which made each death a peculiar grief to the survivors. Yonder is the tomb containing husband, wife, and infant child, who perished in the icy bay in full sight of their happy home and of the friends who cherished them so tenderly. And here we pause before *Bethia's* early grave, and think with a sigh of her bright summer's day spent with her on a neighboring island, when the gayety of the party was checked at the sound of her "church-yard cough," which, in spite of her still blooming cheeks and careless laugh, we all knew to be the knell of her speedy doom.

elders when the bay is to be swept with a glass in search of an expected pleasure-boat, or a look-out kept for the first glimpse of a gaff-topsail as the *Spy* comes creeping around Light-house Head, hugging the shore too closely for unaccustomed eyes to distinguish the slowly gliding masts from the stationary objects on the bank above. There are heavy chests filled with the discarded finery of former generations, the flowered brocade of the great-grandmother who danced with the British officers being the chief treasure of the hoard. The now obsolete spinning-wheel occupies a distant corner, and ranged along the wall are decrepit chairs with wide carved backs, and claw-footed tables too cumbrous for the taste of the present day. Nor is there wanting even here that suggestion of the sea which gives a quaint touch and flavor to all the belongings of Castine. There are rows of huge conch-shells, for which fashion no longer demands a place upon the parlor mantel-piece, and boxes of curiosities collected by childish hands; there are masses of coral rock brought home by

THE OLD GARRET.

the boys from the ballast wharf, and delicate coral fans, the gift of some sailor friend from tropical seas; while the floor is ornamented with rows of star-fish and sea-urchins which the children of to-day have laid in the sun to dry. In the chambers below, the curtained beds and cushioned arm-chairs of old times are set off by quaint engravings or richly toned paintings, reminders of Mediterranean voyages and of hurried visits to art capitals along the coast. The Bay of Naples, or the villa-crowned height of Genoa, smiles from the wall upon the scarcely less beautiful panorama of sea and shore outside the windows; and the sewing-table is adorned with a basket of finest workmanship, the gift of the sailor son, who remembers in Eastern bazars his mother's patient stitching and mending in the days of his boisterous youth. Her daughter's bureau drawers in the opposite room are stored with foreign treasures. All her garments smell of myrrh, aloes, and cassia. When she goes to pay visits, she attires herself in a shawl so wondrously embroidered as to be above the caprices of fashion; and her ivory card-case is a miracle of Chinese art. The grave father of the family cuts his Boston *Transcript* with a sandal-wood paper-knife, and

writes his business letters at a solid desk of camphor-wood, whose massive brass frame fairly lights up the corner of the sitting-room, where it has an abiding-place and a table of its own.

In the parlor the mantel-piece is gay with the artistically grouped feathers of tropical birds; upon the shelves of the what-not are glass jars of the spices of Ceylon, arranged in the various developments of their fruitage; the drawers of the book-case are full of Chinese pictures, innocent of perspective and brilliant in coloring; the table is strewn with ingenious puzzles; and a never-failing source of amusement for stranger guests is the Japanese fan, which, opened aright, of-

fers a brave show of costumed figures, and reversed, tumbles into rags and empty sticks. Even the dining-room and kitchen partake of the foreign element which the great and wide sea brings to this remote shore. Every one in the house recognizes the subtle fragrance when a certain tiny saucepan is brought into requisition, and the children rejoice to see upon the tea table the pale blue jar ornamented with a watery landscape, which hints of preserved ginger within.

Nor is it alone the great square houses that contain these cosmopolitan treasures. The neat white cottages by the shore are made picturesque by their imported belongings. Queer beads and heathenish necklaces dangle from the frames of the looking-glasses; exquisite shells adorn the bureau in the best room; and the tame gray parrot sits on the fence and scolds the passers-by in a foreign jargon, but with an emphasis unmistakably suggestive of his meaning.

Strangers may note with approbation the erection of new houses and the furbishing up of old ones; but it takes us a long time to adopt an addition to the number of long-established roof-trees, or to recover from the loss of a familiar landmark. What native of Castine can hear without a pang of the demolition of the rope-walk?—

“that building, long and low,
Where the wheels go round and round
With a drowsy, dreamy sound,
And the spinners backward go.”

Which of us in childhood ever passed up or down the lonely lane upon which it fronts without coveting for playthings the enormous spools lying just inside the half-opened

door? And how wonderful was it to recognize on Sundays the chief of the “human spiders” in the sweet-voiced tenor of the “orthodox” choir!

The old meeting-house now boasts of a lengthened body and a heightened tower, with inner improvements to match; but dearer to us than the sight of its modernized proportions is the memory of its former low belfry and plain windows; its platform with sofa and chairs, like a miniature parlor; its narrow vestry-room over the front entry, where we listened once a month to items of missionary intelligence, and on other stated occasions to the less exciting reports of individual Christian experience at home.

The stately Normal School which crowns the village height is to us an object of pride, not alone because it indicates the possession of unusual advantages of education, but because it is the design of a local amateur architect, whose remarkable skill and taste in matters requiring the exercise of the artistic faculty have been acknowledged by us all from his boyhood up.

THE SCOLDING PARROT.

ALONG SHORE.

But though our pride is gratified by the noble appearance of our Normal School, our hearts remain true to the old Academy on the common, hallowed by the memory of our earliest strivings after knowledge, and of the boy-and-girl friendships that sweetened study. And then the later gatherings in winter evenings for mature debate and lighter intellectual pleasures!

Castine has been declining in wealth and influence for many years. The importance of the place as a trading station ceased with the separation from the Provinces, and as a military post with the termination of our European difficulties, while subsequent prosperity received a severe check in the removal of the courts, and, still later, the repeal of the fishing bounties, together with the injury resulting from the blockade, sufficed to close all the remaining principal sources of pecuniary profit.

Those of our citizens in whom practical wisdom is a distinguishing trait bewail this complete prostration of business; but we romantic ones rejoice that destiny has added the subtle charm of a vanished splendor to a spot so mournfully fair by nature, and which has no right to assume a brisk and cheerful front.

It was formerly a boast that one might walk the whole length of the quay upon the decks of vessels. But more in keeping with the spirit of the place are the decaying wharves, where, in the summer twilight, groups of friends accompany the music of the lapping waves with songs and laughter and murmured conversation, or sit in pensive silence while a solitary vessel drops slowly down the tide, its dark sails transfigured into silver wings as they cross the path of light which the risen moon has traced upon the quiet sea.

Ah! let us not grudge a share in these pure enjoyments to the world-weary pilgrims who come hither to be refreshed, for, however appreciative of the charms of our scenery such persons may be, they can never know the whole secret of our attachment to this sea-side home. It is as though our eyes were endowed with microscopic power for objects close at hand, and with telescopic range for things remote and hidden. We know every tuft of moss and outcropping boulder along the path to the Bluff, and all the tiny ocean treasures that cluster upon the blackened timbers underneath the wharves. And when from the bastions of the Fort we contemplate the wonderful panorama of our land-locked bay, we are able to add to the features which are visible many points which lie within and beyond the curiously indented shores.

Every body can see the mountains—the dim gray line of the Mount Desert range,

WINONA CLIFF.

Every body can see the mountains—the dim gray line of the Mount Desert range,

the green heights of Camden, the hazy pyramid of Blue Hill—breaking the horizon line to the east, west, and south. But we look toward Mount Desert over Brooksville and Deer Isle, including in our glance their scattered farms and neat villages, and the homes of dear friends who dwell in those secluded nooks. To us the offing shows not only the mysterious line where sky and water meet, but regions that to unauoointed eyes are sunk “below the verge.” With fancy and memory to direct our gaze, we can see Isle au Haut, with its little church upon the steep cliff, and Saddleback Rock, bare of vegetation and swept by every wave, where stands a friendly light-house—first token of the welcome land to returning mariners, last warning to outward-bound ships of danger on the lee. To the westward we can trace the bold promontory of Owl’s Head; the granite coast of Rockland; Camden, with its high mountain overshadowing the village, and its light-house planted on a little tuft of an island just large enough to hold the slender tower, with its cottage and garden; Belfast, picturesque and busy; Bucksport, guarding with frowning batteries the entrance to the river highway. And so around to the northward the main-land incloses beautiful varieties of forest and mountain—fitting background to the gem-like islands that stud the bay, and the peninsula of Castine, itself almost an island, which leads and crowns them all.

And then, too, while strangers carry away with them only an impression of the greenness and brightness of our short summer, to us belong innumerable pictures created by the changing seasons through successive years. We know how Castine looks, transformed into fairy-land under the enchantment of a sudden heavy fall of snow, when every black and lifeless tree is thrown into relief by the white tracery, and every fir and pine bears marvelous fruit upon its rounded tips; when cheery voices echo far in the silent air, and the snow-shovels clang melodiously as the joyful youngsters work a covered pathway through the drift from the house door to the street; when patient oxen plough open the principal roads, and the daily mail can neither come nor go, and a ghastly rumor is afloat of a country funeral where the dead was buried in a shroud, because the messenger sent to Castine for a coffin could not get back in time.

There are other phases of winter less picturesque and more uncomfortable—days of intense cold, when the earth is bare and the bay is frozen over; nights of furious storm, when the chimneys roar and the salt spray carried by the gale is crusted upon windows far up the village street.

And how delightful is the return of spring, after the long bondage of ice is broken!—when buttercups and eyebrights star the

pathway to the Fort, and the gloom of the woods is lighted up by the fresh buds of the spruce and the pale green tassels of the birch; when the good doctor’s tulip bed is ablaze with color, and the lily-of-the-valley borders in the Tilden door-yard entrance the whole neighborhood with the pure loveliness and delicate fragrance of their myriad bells; when double windows and storm doors are consigned to the attic, and the mild air is allowed to stream through the long-closed northeast chamber; when housewives are busy putting away the winter furs and flannels, and the little girls vie with the flower gardens as they go to school in their pretty calico dresses and pink sun-bonnets.

There comes a summer so warm and soft that the peach-tree near the south door of the Witherle mansion, which has hitherto borne nothing but leaves, bursts into rosy bloom. Through the long calm mornings the glassy bay is varied with streaks of white amid the blue, sole token of the currents underneath; but in the afternoon the strong south wind shivers the surface into glittering waves which break with a hollow roar against the light-house cliffs, displaying to us who sit in the cool shadow of the pines the grandeur without the horrors of a storm at sea.

These are the days when baskets are filled and sails are spread for a picnic at Gray’s, or a chowder party at Holbrook’s Island; when less ambitious companies stroll to the light-house woods and take their supper upon the rocks beside the spring; when young girls left at home cluster together in the hospitable porch, or saunter up and down the sidewalk with arms interlaced, rehearsing in friendship the future drama of love.

At this season, too, all avenues of approach to our shores are keenly watched, in anticipation of the arrival of expected friends. The *Lazy Lawrence* seems to puff along more slowly than ever; the *Spy* is an age in rounding the Point, and the old red stage comes creeping at a snail’s pace down the upper end of the “mile square.” On one of these fine mornings we all go down to the wharf to see our white-haired deacon and his handsome wife start on their annual journey to Saratoga, to come back in a few weeks rejuvenated, with perhaps a trace of the vanities of the gay world in their outward attire, but with no diminution of interest in Sabbath-school and prayer-meeting—which state of things is a yearly marvel to the “unconverted” young folks, who can not understand how people can spend a season at Saratoga and *stay pious*!

But shadows begin to fall over the sunny landscape. A chill is in the air, and the consumptive, whose courage had revived under the blue sky of August, droops again,

now that summer is on the wane. Somebody has found the first blossomed spike of the golden-rod—sure harbinger of autumn—and the ominous news makes us all melancholy. The days shorten sensibly, and the nights grow colder. The Witherle peaches, seventeen in number, which had swelled into fair proportions during the heats of July, are stationary, their hard green cheeks showing no signs of the paling and flushing that betoken approaching ripeness. Friends in council offer artificial helps to the process—

FRIENDS IN COUNCIL.

es of nature: one suggests the kitchen mantel-piece, another the south windows, another a dark closet, as a proper forcing-bed for the reluctant fruit. A guest, who has seen somewhere in the bleak region of Aroostook a vine with its separate bunches of grapes tied up in black crape to draw the heat of the sun, proposes to envelop each of the seventeen peaches in the same material; but the mistress of the mansion shudders at the thought of the mournful appearance of the tree—so near the house door, too!—and the unexpected crop is left to wilt and fall with the decaying leaves.

Now and then, as the season advances, comes an interval of soft, dreamy weather, recalling the story of *Evangeline* and the "Summer of St. Martin" in the old Acadia, of which Castine was formerly a part.

On one such day all the town gathers upon the shore to witness the launching of a vessel, in which each inhabitant feels a lively interest—an interest entirely apart from any speculation connected with the material results of future voyages. For the brig has been built on historic ground, just below the site of the old French fort; and as it glides swiftly down the ways and strikes the water above the sunken pier of two hun-

dred years ago, the name of the *Baron de Castine* is again heard among the ruins of his old home, and is greeted with cheers, to which the languid atmosphere imparts a mournful and muffled tone, like voices sounding in a dream, or as though the sound were indeed an echo of the past.

But besides these common experiences, in which the weather and the aspect of external nature bear so important a part, each one of us is conscious of special revelations from earth and sky, which were as epochs in our lives, and will remain sacred and separate in our thoughts forever:—some moment at evening, when the world was full of tender light, the sunset flush still lingering in the clouds and reflected in the waters, the crescent moon and evening star hanging low in the west, the paler ray of the light-house relieved against a background of pines, and afar to the eastward the camp fire of a pleasure party illuminating a shadowy cove: a winter twilight, still and dreary; the sky a sullen gray, excepting at the horizon, where a broad belt of that pale translucent green seen only in high latitudes gives certain

signal of approaching storms: a summer morning among the wild rapids of the northern bay, where a group of friends watch in silence the gambols of young seals upon the rocks: a thunder-storm on Holbrook's Island, and a rainbow hung midway between two shores, its ends lost in the water, and a boat passing beneath the radiant arch: a foggy forenoon in spring, the village hidden and the sea a mist; voices at a distance are wafted mysteriously near, and the tinkle of cowbells on Nautilus Island is heard at the light-house; but the compelling rays from above send first a yellow tinge through the dull gray of the steaming atmosphere, then a single beam pierces the veil, and, lo! the fog begins to lift, the lighter portions detach themselves and float upward as little white clouds; soon the whole mass scatters and vanishes into the upper blue, and the fresh green islands are seen mirrored with magical distinctness in the still depths below. Such scenes as these can never fade from the memory; they haunt us every where, and draw our hearts back to the beloved spot, even when our footsteps may not follow.

To us the magnetic centre of the earth will always be Castine.

JOHN KEATS.—[FROM SEVERN'S SKETCH.]

THE POET KEATS.

JAMES RUSSELL LOWELL, in his *Recol-lections of British Poets*, says, "There are few poets whose works contain slighter hints of their personal history than those of Keats."

Every one who has read the poetry of Keats will agree with Mr. Lowell in this assertion. He seems to have been somewhat sensitive regarding family matters and history, and but little can be found concerning them in biographies of the dead poet.

Two of his nieces are residents of Louisville, Kentucky, both married ladies of high standing in society. I became acquainted with one of them some time ago, and we enjoyed a long and pleasant conversation concerning Keats, spending not a little of our time in examining sheets of his original manuscript. The lady with whom I conversed is Mrs. Philip Speed, daughter of George Keats, the poet's brother. She is a lady of more than ordinary intelligence and of good conversational ability. The other niece is Mrs. George N. Peay.

Mrs. Speed's brother-in-law, James Speed, was Attorney-General under Mr. Lincoln, and all her husband's brothers have held positions of trust in the State of Kentucky. She related to me that her father, George Keats, came to this country with Sir George Flower, and falling in with Audubon, the naturalist, the trio first settled in Harmony, Indiana. They then removed to Henderson, Kentucky, and from there Keats came to Louisville.

"My father always upbraided himself," said Mrs. Speed, "for leaving his brother John in England; he told me of his intention to relate much of the poet's history to myself as soon as I became old enough to understand it.

"Mr. James Freeman Clarke, the Unitarian minister, lived here then, and upon his advice I went to the school of Margaret Fuller, in Massachusetts. She was an excellent and eloquent woman, and I was charmed at the first by her magnificent speech."

"Did your father finally relate to you the history of his brother?" asked I.

"No, Sir; he died when I was but seven-

GEORGE KEATS.—[FROM SEVERN'S SKETCH.]

teen, and up to his death failed to keep his promise—most likely because of my age.

"My father was the eldest of four children. He was a gentleman of elegant manners and fine address. After coming here he built the first saw-mill ever known in Kentucky. He followed mercantile pursuits, and was very successful in doing so. He often spoke of his younger brother John, and frequently chided himself for ever leaving him. My uncle John went to Italy, and father came here. The former was delicate, and in love with one who seems not to have reciprocated the feeling he felt for her. He went to Italy to recover his health, and while at Rome died. Mr. Severn, a devoted friend and admirer of my uncle, went to Italy with him, and remained at his bedside until death. The sketch you see yonder upon the wall was painted by Severn before the poet went to Italy. Severn still lives at Rome. He at one time represented the British government as consul at Rome. In 1858 Dr. Lewis Rogers, of Louisville, while in Italy, visited Severn, and was presented by him with his son's sketch of Keats's grave in the Protestant cemetery at Rome. Dr. Rogers gave me this sketch. That is it over there."

I arose to look at the sketches. One was a picture of John and the other of George Keats, both by old Joe Severn, who knew the brothers well. They are in water-colors upon a kid surface. Severn had a warm affection for John Keats, who was younger than himself, but whom he has outlived long enough to see the poet's fame grow

brighter and brighter, and cause him to feel more than proud of their friendship in former years.

The water-color sketch of Keats, although unfinished, is very good. It represents him leaning upon his elbow, with his hand at his cheek, looking dreamily into distance. Although it is the farthest remove from glad or merry, it is not at all despairing or hopeless, expressing rather the spirit of young poetic reverie, pensive yet ardent, tender yet flushed with the rapt longings of a warm and glowing imagination.

The forehead is broad and open, the waving brown-auburn hair parted and brushed away from the brow. The eyes have great clear depths of hazel-brown; the nose is finely cut; the lips and chin have a sensuous fullness combined with the most sensitive delicacy in a union of rare beauty. Engravings which form the frontispieces of several editions of his works, including those edited by Monckton Milnes and James Russell Lowell, are all taken from the colored sketch just described. The first copy was taken for Mr. Milnes, who wrote to Mrs. Speed for the original, and also such manuscripts as might be in her possession. The engravings from this colored sketch lose the exquisite charm of the mouth, and express the longing and almost morbid sensibility without any of the beautiful roundness of the lines in the original. This deficiency is due to the lack of color, and the sketch is very noteworthy in that respect. The hue of the skin is that of health, the red mantles naturally in the cheeks, the eyes look out from under their brown brows unvexed with suffering, and the whole face glows with the appearance of full, if not robust, healthfulness.

Keats had consumption, probably, when the portrait was sketched, but its ravages

SEVERN'S LAST SKETCH OF KEATS.

had not begun to appear. Joseph Severn did the little water-color of Keats not long before the two in company left England for Italy.

There is another sketch in pencil which the same artist made of his friend, in sad contrast with the first. The last was done when the young poet lay upon his death-bed. Severn sat by him in his agony, at-

through the late Dr. Lewis Rogers, of Louisville, to Mrs. Speed.

A son of the old artist also sent her a sketch of Keats's grave in the Protestant burial-ground at Rome. It will be remembered that this grave was neglected for years, and in 1875 was repaired by friends. The sketch alluded to was made prior to the repairing and setting up of a medallion.

KEATS'S GRAVE.

tempting to divert him from bodily pain and painful thoughts by making a rough drawing of his features. It is a sad and piteous picture. Thin and wasted, with heavy lids whose dark lashes fall upon hollow cheeks, with hair disheveled and tremulous lips, the poor boy-poet seems to have been tossing and beating out his life. His head droops to one side upon his pillow, and in this moment of exhaustion and quiet the faithful friend, who loved him and staid by him to the last, presents the closing scene in the short, mournful drama of his life.

The sketch was afterward copied at Rome by Mrs. Sarah Clarke, and sent by her,

The grave was then neglected. The headstone is low, and contains the epitaph:

"This grave contains all that was mortal of a young English poet, who, on his death-bed, in the bitterness of his heart at the malicious power of his enemies, desired the words to be engraved on his tomb,

"HERE LIES ONE WHOSE NAME WAS WRIT IN WATER."

In its renewed condition box-wood fences it; violets grow upon the grave itself; and a young and noble English lady has given a sum of money which provides that these shall be cared for, and when any wither, they shall be replaced, so that violets will always grow there. Our illustration shows the grave in its present condition. These repairs were made with funds furnished by

Mrs. Clarke, Mr. Severn, an English lady, and Mrs. Speed. The following letter to Mrs. Speed shows what interest was taken in the matter by the English and Americans at Rome.

"ROME, April 7, 1875.

"MY DEAR EMMA,—I received both your letters—that containing the remittance a few days since. I have the pleasure to inclose you a photograph of the grave as it now is. We think it looks very well. This was taken from beyond the fosse, and, as you see, the inscription now is quite legible from that point. It will now keep in good condition for at least one hundred years, and perhaps much more. The stone itself is very thick and solid, and perfectly sound, and the setting it upon a low pedestal has been all that could well be done for it, except restoring the inscription, which was the chief part of the expense. I like it all except the marble border around the grave, which looks too near and staring; but I have given orders for some ivy plants to be placed along this border, to run over it and break the lines. Every one is much interested about it, and the guardian of the cemetery says that the people are now all the time inquiring for the grave of Keats. They have heard something about these events. Sir Vincent Eyre has set on foot a subscription among the English and Americans for a medallion likeness of the poet, to be made from the mask in Mr. Severn's possession, and it is already begun. Mr. Warrington Wood, a sculptor of good reputation, has offered to give his services in modeling the medallion as his part of the subscription; so the thing will be easily accomplished. It is proposed to place it in a part of the walk near the grave, and which you can see at the same time you are looking at the old stone, though it does not come into the view that I send you. I like this plan rather better than the one of combining it with the old stone. Mr. Severn has painted a charming picture of the grave of Keats by moonlight, a sleeping shepherd lying on it, and goats browsing about. This is in allusion to the poem of 'Endymion.' Mr. Severn, though more than eighty years of age, still paints and enjoys his life. Though his hands are disabled with rheumatism, so that he can no longer play on the piano, this does not hinder him from painting, and I don't know any one who seems to enjoy his life more. Truly your friend,
SARAH CLARKE."

The medallion mentioned is placed upon the pilaster of the small arched gateway spanning the fosse which surrounds the old cemetery. The grave, it has been stated, is close to this gate; and as the spectator stands before the tombstone, he has the medallion immediately upon the left. It is sculptured upon a rectangular slab, and is surrounded by a circular wreath, beneath which are inscribed the following lines, the initials of which form an acrostic:

"Keats, if thy cherished name be 'writ in water,'
Each drop has fallen on some woman's cheek—
A sacred tribute such as heroes seek,
Though oft in vain, for dazzling deeds of slaughter.
Sleep on! not honored less for epitaph so meek."

—SIR VINCENT EYRE.

This was inclosed to Mrs. Speed in a letter from the Rev. James Freeman Clarke, written with a gold pen given him by the late Hon. Charles Sumner.

The other sketch, that of George Keats, the brother of John, who came to America, and father of Mrs. Speed, is in a more finished state. It is well executed, like the other, and presents a handsome face strongly resembling the poet's, but having a more alert and keener expression. There is a ready directness in his glance, and an intelligent, adaptable look which indicates clearly a man likely to succeed in life. It is, however, a refined face, and very fine-looking, with a lofty forehead, independent expression, and the high-bred look of a cultivated man of the world. The sketch was drawn in England about the same time as that of the poet. Among the memorials shown me I found a letter from J. W. Reynolds. He appears to have been a very ardent admirer

*The wonders of all-ruling Providence;
The joys that from celestial Mercy flow;
Essential beauty; perfect excellence,
Ennobled and refine the native glow
The poet feels — and thence his best resource
To paint his feelings with sublimest force.*

April 23. 1817

*The plain English of this, — is
The Bible is the best book
for a poet to form his taste by.*

of Keats, and in his note advises the young poet to "annul the *Quarterly Review* by the best of all answers."

In closing, Reynolds says, "Do *you* get fame, and *I* shall have it in being your steady friend. There is no one I am more interested in, and there is no one that I have more pleasure in communicating my happiness to."

Mrs. Speed has in her possession quite a number of Keats's original MSS. I had the pleasure of looking at several of them. The poet's letters are of a medium size, and well formed. His sheets are neat, and from the few scratches and blots it is evident that Keats's train of thought was quite free. Among unpublished effusions I found the following:

SONNET.

- "There was a season when the fabled name
Of high Parnassus and Apollo's lyre
Seemed terms of excellence to my desire;
Therefore a youthful bard I may not blame.
- "But when the page of everlasting Truth
Has on the attentive mind its force imprest,
Then vanish all the affections dear in youth,
And Love immortal fills the grateful breast.
- "The wonders of all-ruling Providence,
The joys that from celestial Mercy flow,
Essential beauty, perfect excellence,
Ennoble and refine the native glow

The poet feels; and thence his best resource
To paint his feelings with sublimest force."

The preceding is written in plain characters upon a half sheet of parchment paper. The date attached is April 23, 1817. Following this are the words, "The plain English of this is, the Bible is the best book for a poet to form his taste by."

In one of the letters from Keats to his brother he alludes to an evening at the "Mermaid" with Horace Twiss and Horace Smith, saying their being together at this place revived thoughts of Ben Jonson, Fletcher, Beaumont, and others who used to assemble there in days of yore. Upon the occasion in question Keats composed the lines commencing,

"Souls of poets dead and gone,
What Elysium have ye known,
Happy field or mossy cavern,
Fairer than the Mermaid tavern?"

"Reynolds, Dilke, and others," says Keats, "were pleased with this beyond any thing I ever did."

In this letter Keats alludes to the fondness of Twiss for repeating extempore verses—written, however, at home—and incloses a very clever take-off on him and his verses by Horace Smith.

THE JEET-BLACK GROOM.

PART I.

THE rain maks a' the Tweed drumlie;
Sae does it a' the Tyne.
In Berwick sit twa gey guid knights,
Drinkin' the bluid-red wine.

"O whaur will I get a groom, Sir Hugh,
To tak my horse in han'?
For I hae lost the bonnie boy
That cam frae a foreign lan'.

"The witless wicht, he aye wud ride—
Forbidden he wudna be—
Wi' neither bit na bridle-rein,
Amang the cliffs sae hie.

"Ae immis nicht, at Burntisland,
He rade 's gin he'd been fey,
Until he cam whaur King Alshinur
Did meet his dyin' day.

"An' there he stude on high horseback,
An' leukit i' the faem,
An' left twa foot-prints i' the sna',
But never mair cam hame.

"An' I hae taen fu' mony a page,
An' mony a churl's loon,
But there's nae mair that can compare
Wi' him that sae did droon."

"O haud yer tongue, Sir Thomas Moncrieff;
There's mony as guid as he;
For I hae twa i' my castle ha',
An' ane I'll gie tae thee.

"The tane's as white as the sea-mew's down;
The tither's as black 's the slae.
The tane sall bide wi' my horse Tristrem;
The tither wi' you sall gae.

"The tane sall bide wi' my horse Tristrem:
There was ne'er sae gallant a steed;
There's nae his like in a' Scotlan'.
Frae Pentland Frith tae Tweed."

"O haud yer tongue," said Sir Thomas;
"There's mony as guid as he.
There's a horse that stan's in my stable,
His marrow did never see."

"Noo I will wager," said proud Sir Hugh,
"Against or mair or less,
A hundred pounds in guid red gowd,
That Tristrem will win a race."

"There's neither gowd nor fee, Sir Hugh,
Amang my kith an' kin;
But I'll wager my head an' my horse Rolan'
That Rolan' the race will win."

They made a pact atween them twa
That, on a day in June,
Their horses sud rin o' the joustin' groun'
By the castle in Stirlin' toon.

An' up it startit a little page—
His een wi' tears ran ower—
An' he has run tae Sir Thomas' ladye,
An' fand her in her bower.

"O wae is me, fair lady," he said;
"For ill luck I do guess:
Sir Thomas has wager'd his head wi' Sir Hugh
That Rolan' will win a race."

"O wae is me," said Sir Thomas' ladye,
As the saut tears trinkled doon;
"I wud gie a' my jewels the day
For him that ance did droon.

"Your brither lies by Burntisland,
Fu' deep i' the green-hiwe sea;
But O for a leuk at that bonnie face,
An' a blink o' that blythe black e'e!"

Then up it spak her ae dauchter,
An' her face was like the dawn:
"O never fear, my mither dear,
My faither's in God's han'.

"THEY MADE A PACT BETWEEN THEM TWA."

"I dreamt a dream—'twas sin' yestreen:
Sic dreams bode never ill.
I dreamt my faither's white heron cam hame,
Jeet-black-frae tail tae bill.
"He set himsel on Rolan's back,
An' baith flew fast awa';
But when they cam tae the trystin'-stane,
The heron was white as sna'.
"Gae doon, gae doon, my little page,
As fast as ye can gae,
An' lay this glove in Rolan's crieve,
An' gie him corn an' hay."
An' when he cam tae the stable door,
The door stude open wide,
An' Sir Hugh was there, wi' 's foot i' the stirrup.
Jist ready for tae ride.
"O whaur are ye gaun, ye little page,
An' what do ye bear away?"
"I gang tae lay this glove in Rolan's crieve,
An' gie him corn an' hay."
"Whaur gat ye the glove," said the proud Sir Hugh,
"An' why lay ye it there?"
"Wha brings nae the glove o' Lady Ann,
He canna gae Rolan' near.
"The marrow she gae tae my brither dear,
Ere he droont i' the faem;
An' aye when Rolan' waxes wood,
Nocht else his rage can tame.
"But never sae wood does Rolan' wax,
An' never does rear sae hie,

But a touch o' this glove an' a word in his ear
Will bring him tae his knee."

"Gie me the glove," said the proud Sir Hugh,
"An' I'll gie him hay an' corn;
For I hae promised Sir Thomas a groom—
His like was never born."

"I winna gie ye the glove, ye fause Sir Hugh—
I winna gie ye the glove;
For ye wud tak my maister's life,
An' wrang his ain dear love."

Sir Hugh loupit doon frae his high saddle,
An' grippit him by the arm;
He's taen the glove frae the little page,
An' done him meikle harm.

An' awa' he rade tae his ain castèl,
An' tirlèd at the pin;
An' wha was there but the jeet-black groom
Tae lat his maister in.

"Come hither, come hither, my jeet-black groom—
Come hither, an' speak tae me;
For I hae wark tae do i' the dark,
An' nane sall ken but thee.

"I gae ye hose, an' I gae ye shoon,
An' I took ye frae the byre;
I've gien ye meat, an' I've gien ye drink,
An' I've paid ye weel yer hire.

"Noo ye maun gang tae Sir Thomas' ha'
Early the morrow morn,
An' ye maun groom his horse Rolan'
An' gie him hay an' corn.

"An' ye maun tak this silken glove,
 An' wear 't, ae day in June,
 When Rolan' rins a race wi' Tristrem
 By the castle in Stirlin' toon.
 "For Sir Thomas has wager'd a wood wager—
 May God forgie his sin!—
 He's wager'd his head an' his horse Rolan'
 That Rolan' the race will win.
 "An' when ye come to the half-way stane,
 An' Rolan' first sall be,

A touch o' this glove an' a word in his ear
 Will bring him tae his knee.

"But an ye win this race for me,
 An' Sir Thomas lose his life,
 Ye sall hae twenty pounds in gowd,
 An' his dauchter to be yer wife."

"O never fear," said the jeet-black groom,
 "Gin ye'll do as ye say;
 For I hae heard o' Sir Thomas' dauchter,
 An' she is a winsome may."

PART II.

The sun shines bricht frae Forth tae Clyde,
 He shines on Stirlin' toon;
 An' there's mony a lord an' mony a dame
 Gather'd that day in June.

For the twa best steeds in a' Scotlan',
 Wi' their groons upo' their back,
 Are tae rin a race for a wood wager:
 Wae worth whae'er does slack!

At the break o' day Sir Thomas' ladye,
 Wi' meikle dule and care,
 Raise up an' gaed doon to Rolan's stable,
 An' the jeet-black groom was there.

He kamed him back, an' he kamed him fore,
 An' he kamed his lang black mane,
 An' he lilted a sang wi' an owercome sweet:
 "This nicht at the trystin'-stane!"

"Wae worth! wae worth ye! jeet-black groom;
 What gars ye sing sae sweet?
 Hoo can ye sing wi' a lightsome heart?
 Mair cause ye hae tae greet.

"Ye little ken what's in store for me
 An' Sir Thomas lose his life.
 I wud rather be rowed i' my windin'-sheet
 Than be Hugh Seton's wife."

"Cheer up, cheer up, my gay ladye,
 An' leukna sae forlorn;
 There's mony a slip 'tween the cup an' the lip,
 An' the langest nicht has a morn."

"But an ye win the race," she said,
 "An' save baith mine an' me,
 Then ask a boon; ye sallna want
 The best that I can gie."

The lady gaed tae Rolan's sta',
 An' a word spak in his ear:
 "Gin ye but win the race the day,
 Ye'se hae baith gowd an' gear.

"I'll tak the necklace aff my neck,
 An' the rings frae aff my han',
 An' ye sall be shod wi' burnin' gowd,
 The best in a' the lan'."

The jeet-black groom led Rolan' oot,
 An' they're a' to the joustin' green;
 An' mony a lady bade him *Godspeed*,
 Wi' the saut tears in her een.

But when they cam tae the startin'-stane,
 An' baith were ready tae rin,
 Tristrem had saddle an' bridle an' bit,
 But Rolan' he had nane;
 But the jeet-black groom sat on his back
 As gin the twa war ane.

The bugles blew; the horses flew
 Like stour afore the win';
 An' breast tae breast for mony a rood,
 I wat they didna blinne.

But when they cam where Lady Mary stude,
 Wi' meikle dule an' care,
 The jeet-black groom stude tae his feet,
 An' a glove threw i' the air.

It lichtit at Lady Mary's foot,
 An' gart her lat doon her een;

But when she rais'd them up again,
 Nae Rolan' cud be seen,
 But a thick black cloud o' risin' stour,
 An' Tristrem rinnin' him lane.

But Lady Ann lootit, an' liftit the glove,
 An' her wan face grew like flame.
 "O mither! O mither! the richt-han' glove—
 My faither's white heron's come hame!"

"O haud yer tongue," said Lady Mary;
 An' nae mair cud she say;
 For a deavin' shout ran up the crowd:
 "It's Rolan' has won the day!"

She took the necklace aff her neck,
 An' the rings frae aff her han'.
 "Rolan' sall be shod wi' burnin' gowd,
 The best in a' the lan'.

"God bless ye, God bless ye, jeet-black groom!
 May a' guid ye befa'!
 Gin I had gowd as I hae will,
 Ye sud hae baith house an' ha'."

An' up it cam the little page,
 An' the tears ran doon his face:
 "O wae is me! for the jeet-black groom
 Lies lifeless o' the grass.

"He stoppit ower short wi' his horse Rolan'
 When he cam tae the stannin'-stane.
 Sir Thomas is washin' his bluidy face,
 An' that face is as white's yer ain."

"Wae worth ye! wae worth ye!" said Lady Ann;
 "Why tell ye me that for shame?
 I tauld ye weel, my mither dear—
 My faither's white heron's come hame.

"But I maun gang tae whaur he lies—
 O mither, gang wi' me!
 An' I but kiss his bonnie cheek
 An' his chin, he daurna dee."

An' when she cam she knelt her doon,
 An' kissed him cheek an' chin:
 "O better I lo'e ye, fremsted groom,
 Than a' my kith an' kin."

"O wae is me!" said Lady Mary,
 As she stude by her side;
 "Gin he'd been but spart, my ae dauchter,
 Ye nicht hae been his bride."

An' up it spak a haughty lord,
 Wi' a loud lauch turn'd him roun':
 "It's better he's dead than a lady gay
 Sud wed wi' a churl's loon."

"O haud yer tongue," said the little page,
 "Or else ye'll rue 't anon.
 Yer ain bluid ran i' that young man's veins:
 Lord Heron, d'ye ken yer son?"

"Yer cruel wife an' the fause Sir Hugh
 Wud fain hae strangled us baith;
 But we wan away, an' twice we saved
 Lady Mary frae waur than death."

He turned him richt an' round aboot,
 An' his face grew pale an' wan.
 "O God o' my kin! my ain twa boys
 That I've socht in ilka lan'!

"THE JEET-BLACK GROOM STUDE TAE HIS FEET,
AN' A GLOVE THREW I' THE AIR."

"I've socht ye east, an' I've socht ye west,
I've socht ye frae morn tae e'en;
An' noo the tane stan's there an' tells
That the tither lies dead o' the green."

He knelt him doon by the pale, pale face:
"O this is sair tae bide!
Gin he'd been but spar't the day, ladye,
Ye micht hae been his bride."

He lifted him up frae the bluidy grass—
O gin his lips were red!—
An' bore him tae a shepherd's lodge,
An' laid him on a bed.

"A leech! a leech!" Lord Heron cried;
"Gae bring a leech wi' speed;
For, oh! his heart begins tae beat,
An' his wounds begin tae bleed."

They wush his wounds wi' silken towels,
An' band them wi' hollan' fine,
An' they bathed his face wi' rose-water,
An' his lips wi' bluid-red wine.

An' a' that day they waukit him,
An' a' that lee-lang nicht.

They spak never a word; but Lady Ann
Prayed fast wi' a' her micht.

An' aye he maned, an' aye he spak,
An' glammacht wi' his han',

O' the fause Sir Hugh, an' Lady Heron,
An' bonnie Lady Ann.

But when the day began tae dawn,
An' the cock began tae craw,
There cam a page frae Lord Heron's castle:
"Lady Heron has run awa'!"

"She's ower the border wi' fause Sir Hugh,
As fast as she can dree."

"Christ's curse gae wi' her!" said Lord Heron,
"An' an ill death mat she dee!"

"She sent my twa sons tae the fremd,
An' their life she fain had taen."
Lord Heron's heir gae a lang, lang mane,
An' opened baith his een.

He leukit richt, he leukit left:

"I surely hae sleepit lang;
An' whaur is the fause Sir Hugh," he said,
"An' whaur is Lady Ann?"

Lord Heron kissed him on the brow,
An' he kissed him on the cheek;
But nane cud greet, an' nane cud smile,
An' nane a word cud speak.

Lady Mary lifted her daughter up,
An' her een were red as flame.

"Yer prayer is heard, my dear daughter,
An' yer faither's white heron's come hame."

There's a bridal the morn in Stirlin' toon,
An' mony a lord 'll be there,
An' mony a dame; for bonnie Lady Ann
Is to wed Lord Heron's heir.

NYMPHÆA LUTEA.

HOME OBSERVATIONS IN FLORIDA.*

ANIMAL and vegetable life here in Florida is in striking contrast with what I see around me at the North. I can botanize all winter without leaving home; and not only do I find many plants new to me, but some are new to science, having been overlooked by tourists and men of science who take a wide range, not being obliged to settle down and stay in one spot.

Even the streams and pools of Florida are no more like those of the North than is the vegetable and animal life with which they abound. Strange fish and alligators and many wonderful plants live in the deep narrow streams that find their way to the broad St. Johns. And the St. Johns itself, where is its like? Five miles broad, flowing northward, deep and dark, but not always quiet and lazy, as some poetic writers depict it, as we who live upon its banks can testify. A strong northeast wind will soon agitate and stir the water almost to its very depth, making it extremely dangerous for small boats. But there are weeks together when the river is so quiet that we feel perfectly safe to trust ourselves upon its placid surface in a row-boat, by which means we can visit the coves near home which have escaped the eyes of the botanists who have traversed the river's length in larger craft.

* With illustrations, by Mrs. P. T. W. Campbell.

LEAF OF NYMPHÆA LUTEA.

Upon one of my first excursions in a row-boat I was attracted to the nearest cove, where acres of the water were covered by a beautiful variegated leaf of a strange water-lily, which bore a yellow flower. I saw it was a *nymphaea*; but its manner of growth and whole appearance were so unlike our white water-lily (*Nymphaea odorata*, Ait.) that I knew it must be a distinct species, of which no mention was made in the text-books of Gray or Chapman.

I soon wrote to Dr. Asa Gray, our authority on botany, and to Professor Sargent, director of the Botanic Garden at Harvard, telling them of my discovery. They seemed as much elated over it as myself, and informed me that Audubon had figured a yellow water-lily in his book of birds of the South, but had made no mention of it in the text, and so botanists had generally believed it to be simply a fancy of the author. But here it was, acres and acres, a living testimony to Audubon's truth and skill.*

Its manner of growth is peculiar. How it maintains a foot-hold in the soft oozy mud, when the water is so often agitated, is almost a mystery. The rhizoma is not

* Since the above was written and passed from my hands, I have received the following additional information respecting the yellow water-lily from Professor Sargent:

"The authority for the name of *Nymphaea flava* rests on the figure of the white American swan (t 384) in Audubon's *Birds of America*, in which there is a very good representation of your plant. Under it, it says, '*Nymphaea flava*, Lutren.' There is no description of the flower or any character given, so that *Nymphaea flava* has never been published yet. It will, however, be proper to preserve Lutren's name, and he should stand always as authority for the species, whoever may draw up and print the technical description. You know, I dare say, that Lutren was a young German who, years ago, botanized in Florida, and who was killed there by the Indians. He probably made notes of his discoveries, but, so far as I know, these have never been published."

GOVERNOR'S CREEK.

creeping, as in the white water-lily, but always stands in an upright

position, and I have never found it more than a foot in length; the lower part rots away as the plant extends upward. Each year a new circle of leaves starts out above the old ones, the old ones dropping away, leaving the scars on the rhizoma; so, also, a new set of roots starts just beneath the new leaves, the old roots dying away like the leaves. This makes the rhizoma a scarred, straight, under-ground stem, apparently useless.

In the larger plants it is a foot in length, and six or eight inches in circumference. After it has done its work of supplying the plant with leaves and roots, this seemingly worthless appendage performs new duties in order to perpetuate its race. It sends out long white runners, often a yard in length, and on the end of each a little plant grows; as soon as this plant is well started, the runner continues, and throws out another plant, the same as the strawberry, only this is on a much grander scale. Sometimes as many as four runners are attached to one rhizoma, and three or four small plants strung along each runner. As soon as the new plants become well established,

the runner decays, and the little ones are now able to stand by themselves, and each has an independent existence, repeating the history of its parent. But this is not the only way that the lily is perpetuated: it also forms small bulbs or bulb-lets, which drop into the soft mud and take root.

This work is all going on in the spring before the plant blossoms. It does not bloom until about the 1st of May. The flower is like the white pond-lily in form, but the inner surface of the petals is plain yellow, while the outer surface—as we often see in the white lily—is streaked with pink. It probably ripens seeds, but I staid in Florida only long enough to see it well in flower, and when I returned, late in autumn, I could find no seeds.

The first figure represents a plant soon after the old leaves have been cut down by frost. In December, 1866, the leaves all suddenly disappeared from the surface of the water—the effects of a sharp frost—but in January following new ones reached the surface.

The upper surface of these new leaves is beautifully variegated with dark purple and light and dark shades of green, and sometimes yellow; the under surface is a deep purplish-red.

In a large cove only a few rods from home this lily extends over several acres. The beautiful leaves lie thick upon the water; and in May, when the flowers appear, it is one of the grandest sights I ever beheld. It grows in water from one to five feet in depth, the length of the leaf stems and flower scapes depending upon the depth of the water.

How far it extends remains to be seen. I have traced it about forty miles along the St. Johns. It grows all about Jacksonville—thirty-five miles below us—within a few yards of the Grand National Hotel, and how it has so long escaped the botanist is a mystery. But the plants around Jacksonville are not so beautiful and striking in appearance as those near home, probably owing to the rough treatment to which they must naturally be subjected.

Last year I shipped a good supply of plants to the Botanic Garden at Harvard, which are doing well, and they hope for blossoms this spring.

A short distance from home is a deep,

narrow stream, known as Governor's Creek, which takes its rise in the low marshy grounds, and pursues its course amid a wild and tangled forest, increasing in size as it approaches the St. Johns, in whose murky water it is lost.

Alone on this stream, or with a single oarsman, and no sound save the plash of the oar, one's thoughts revert to primeval times. But the boats with their gay and fashionable occupants have almost spoiled the pristine look.

At the mouth of this creek we also find our lily — *Nymphaea lutea* — in abundance, but it is soon replaced by the common yellow lily, or bonnets (*Nuphar advena*, Ait.), which here assume gigantic proportions. The leaves measure from eighteen to twenty inches across, and cover the water on either side of the deep channel for the distance of a mile or more. The leaves and flowers reach the surface of the water in some places from a depth of ten feet. A bouquet of these, with ten feet of flower scape and leaf stalk, would do to present to Swift's Brobdignagian heroine!

Forcing our boat through these immense lilies to the shore, we land amid a tangled thicket of flowering shrubs and vines. The beautiful snow-drop-tree (*Halesia diptera*, L.), with its clusters or short racemes of pure white blossoms, is one of the first to reward us for our effort. Myriads of insects are hovering about the flowers with a loud humming noise, as if warning us to beware of their anger. The yellow jasmine (*Gelsemium sempervirens*, Ait.) clambers over shrubs and trees in the greatest profusion, filling the air with its delicious fragrance.

A gigantic cypress (*Taxodium distichum*, Rich.), an old dying monarch of the forest, whose trunk measures thirty feet in circumference, is clothed from base to the towering branches above with the large shining emerald-green leaves of a lovely vine (*Decumaria barbara*, L.). It clings close to the trunk, throwing out little rootlets, which grasp the bark so closely that the vine seems a part of the tree. It is just coming into flower; the flower stems are six to eight inches in length, and stand straight out from the tree, and are scattered thickly along the entire length of the trunk, and each stem bears three or four pairs of large leaves, and is terminated by a cyme of numerous fragrant white blossoms.

Several members of the heath family are also in flower, the most conspicuous being the swamp-honeysuckle (*Azalea nudiflora*, L.). Some of these shrubs bear large clusters of pure white flowers, while others have deep rose-pink blossoms. This azalea is here so ambitious to appear foremost among the flowering shrubs that it fairly forfeits the title of *nudiflora*, the blossoms appearing amidst the old setting of leaves.

But my delight culminated in finding a beautiful amaryllis lily growing amid the dense thicket in the soft mucky soil along the banks of the stream.

The leaf is much broader and longer than the old form of *Amaryllis atamasco*, L., and the flower finer and larger, and blooms some two months earlier. Some of the largest leaves measure two feet in length, and the largest flowers five inches across, and five inches in length.

It commences to bloom in January, and continues in flower until March. It bears transplanting to common garden soil, where it does not depreciate in size of leaf or flower.

Last year I sent some three hundred bulbs

FLOWER OF NYMPHEA LUTEA.

to the Botanic Garden at Harvard to have it tested, and the director writes me, under date of February 2, 1877, "Your atamasco lily is a splendid thing, much finer than the old form, and is now charmingly in flower, and very beautiful."

Early in February the damp pine-barrens are flecked with the golden and purple flowers of the pinguiculas. These flowers are arranged upon such a plan that cross-fertilization must depend upon the agency of some small insect. The stamens and pistil are concealed in a little cavity in the throat of the corolla, so that it is necessary to pull the flower to pieces in order to see them, and as the throat is half closed, only a small insect can do the fertilizing work.

Taking my stand in the midst of these

AMARYLLIS ATAMASCO.

flowers on a clear still day, I soon had the satisfaction of becoming acquainted with the little agent who accomplished the work.

It was a hymenopterous insect—a spiteful little bee, so small that it could easily enter the half-closed throat, and disappear in the bulge or swelling of the upper part of the spur, where it was large enough for it to turn round and make its exit head-first. Placing my hand over the flower after the bee disappeared, I held it a prisoner, but not without a retaliating sting.

I watched these insects several successive days, and found them to be unerring workmen. Although there were other flowers in close proximity about the same size, color, and height of the pinguiculas (*helianthemums* and *ascyruns*), yet these, as far as I saw, were never visited by the little bee. How it could so unerringly discriminate between these flowers is almost a marvel. Half a dozen yards distant, I could not tell whether the golden-yellow flowers were those of *Pinguicula lutea* or *Helianthemum carolinianum*.

Butterflies visited the flowers indiscriminately, and, as they could be of no use to the plant—not being able to come in contact with the stamens—it was not necessary for them to discriminate. But every time the bee passed in and out of the throat, it unavoidably rubbed against the stamens, and carried with it some of the pollen, to be left on the stigma of the next flower visited.

EREMA; OR, MY FATHER'S SIN.

CHAPTER XXXIX.

NOT AT HOME.

MRS. HOCKIN, however, had not the pleasure promised her by the facetious Major of seeing me “make up to my grandmamma.” For although we set off at once to catch the strange woman who had roused so much curiosity, and though, as we passed the door of Bruntlands, we saw her still at her post in the valley, like Major Hockin’s new letter-box, for some reason best known to herself we could not see any more of her. For, hurry as he might upon other occasions, nothing would make the Major cut a corner of his winding “drive” when descending it with a visitor. He enjoyed every yard of its length, because it was his own at every step, and he counted his paces in an under-tone, to be sure of the length, for perhaps the thousandth time. It was long enough in a straight line, one would have thought, but he was not the one who thought so; and therefore he had doubled it by judicious windings, as if for the purpose of breaking the descent.

“Three hundred and twenty-one,” he said, as he came to a post, where he meant to have a lodge as soon as his wife would let him; “now the old woman stands fifty-five

yards on, at a spot where I mean to have an ornamental bridge, because our fine saline element runs up there when the new moon is perigee. My dear, I am a little out of breath, which affects my sight for the moment. Doubtless that is why I do not see her.”

“If I may offer an opinion,” I said, “in my ignorance of all the changes you have made, the reason why we do not see her may be that she is gone out of sight.”

“Impossible!” Major Hockin cried—“simply impossible, Erema! She never moves for an hour and a half. And she was not come, was she, when you came by?”

“I will not be certain,” I answered; “but I think that I must have seen her if she had been there, because I was looking about particularly at all your works as we came by.”

“Then she must be there still; let us tackle her.”

This was easier said than done, for we found no sign of any body at the place where she certainly had been standing less than five minutes ago. We stood at the very end and last corner of the ancient river trough, where a little seam went inland from it, as if some trifle of a brook had stolen down while it found a good river to welcome it. But now there was only a little

oozy gloss from the gleam of the sun upon some lees of marshy brine left among the rushes by the last high tide.

"You see my new road and the key to my intentions?" said the Major, forgetting all about his witch, and flourishing his geological hammer, while standing thus at his "nucleus." "To understand all, you have only to stand here. You see those leveling posts, adjusted with scientific accuracy. You see all those angles, calculated with micrometric precision. You see how the curves are radiated—"

"It is very beautiful, I have no doubt; but you can not have Uncle Sam's gift of machinery. And do you understand every bit of it yourself?"

"Erema, not a jot of it. I like to talk about it freely when I can, because I see all its beauties. But as to understanding it, my dear, you might set to, if you were an educated female, and deliver me a lecture upon my own plan. Intellect is, in such matters, a bubble. I know good bricks, good mortar, and good foundations."

"With your great ability, you must do that," I answered, very gently, being touched with his humility and allowance of my opinion; "you will make a noble town of it. But when is the railway coming?"

"Not yet. We have first to get our Act; and a miserable-minded wretch, who owns nothing but a rabbit-warren, means to oppose it. Don't let us talk of him. It puts one out of patience when a man can not see his own interest. But come and see our assembly-rooms, literary institute, baths, etc., etc.—that is what we are urging forward now."

"But may I not go first and look for my strange namesake? Would it be wrong of me to call upon her?"

"No harm whatever," replied my companion; "likewise no good. Call fifty times, but you will get no answer. However, it is not a very great round, and you will understand my plans more clearly. Step out, my dear, as if you had got a troop of Mexicans after you. Ah, what a fine turn for that lot now!" He was thinking of the war which had broken out, and the battle of Bull's Run.

Without any such headlong speed, we soon came to the dwelling-place of the stranger, and really for once the good Major had not much overdone his description. Truly it was almost tumbling down, though massively built, and a good house long ago; and it looked the more miserable now from being placed in a hollow of the ground, whose slopes were tufted with rushes and thistles and ragwort. The lower windows were blocked up from within, the upper were shattered and crumbling and dangerous, with blocks of cracked stone jutting over them; and the last surviving chimney gave less smoke than a workman's homeward

whiff of his pipe to comfort and relieve the air.

The only door that we could see was of heavy black oak, without any knocker; but I clinched my hand, having thick gloves on, and made what I thought a very creditable knock, while the Major stood by, with his blue-lights up, and keenly gazed and gently smiled.

"Knock again, my dear," he said; "you don't knock half hard enough."

I knocked again with all my might, and got a bruised hand for a fortnight, but there was not even the momentary content produced by an active echo. The door was as dead as every thing else.

"Now for my hammer," my companion cried. "This house, in all sound law, is my own. I will have a 'John Doe and Richard Roe'—a fine action of ejectment. Shall I be barred out upon my own manor?"

With hot indignation he swung his hammer, but nothing came of it except more noise. Then the Major grew warm and angry.

"My charter contains the right of burning witches or drowning them, according to their color. The execution is specially imposed upon the bailiff of this ancient town, and he is my own pickled-pork man. His name is Hopkins, and I will have him out with his seal and stick and all the rest. Am I to be laughed at in this way?"

For we thought we heard a little screech of laughter from the loneliness of the deep dark place, but no other answer came, and perhaps it was only our own imagining.

"Is there no other door—perhaps one at the back?" I asked, as the lord of the manor stamped.

"No, that has been walled up long ago. The villain has defied me from the very first. Well, we shall see. This is all very fine. You witness that they deny the owner entrance?"

"Undoubtedly I can depose to that. But we must not waste your valuable time."

"After all, the poor ruin is worthless," he went on, calming down as we retired. "It must be leveled, and that hole filled up. It is quite an eye-sore to our new parade. And no doubt it belongs to me—no doubt it does. The fellow who claims it was turned out of the law. Fancy any man turned out of the law! Erema, in all your far West experience, did you ever see a man bad enough to be turned out of the law?"

"Major Hockin, how can I tell? But I fear that their practice was very, very sad—they very nearly always used to hang them."

"The best use—the best use a rogue can be put to. Some big thief has put it the opposite way, because he was afraid of his own turn. The constitution must be upheld, and, by the Lord! it shall be—at any

rate, in East Bruntsea. West Bruntsea is all a small-pox warren out of my control, and a skewer in my flesh. And some of my tenants have gone across the line to snap their dirty hands at me."

Being once in this cue, Major Hockin went on, not talking to me much, but rather to himself, though expecting me now and then to say "yes;" and this I did when necessary, for his principles of action were beyond all challenge, and the only question was how he carried them out.

He took me to his rampart, which was sure to stop the sea, and at the same time to afford the finest place in all Great Britain for a view of it. Even an invalid might sit here in perfect shelter from the heaviest gale, and watch such billows as were not to be seen except upon the Major's property.

"The reason of that is quite simple," he said, "and a child may see the force of it. In no other part of the kingdom can you find so steep a beach fronting the south-west winds, which are ten to one of all other winds, without any break of sand or rock outside. Hence we have what you can not have on a shallow shore—grand rollers: straight from the very Atlantic, Erema; you and I have seen them. You may see by the map that they all end here, with the wind in the proper quarter."

"Oh, please not to talk of such horrors," I said. "Why, your ramparts would go like pie crust."

The Major smiled a superior smile, and after more talk we went home to dinner.

From something more than mere curiosity, I waited at Bruntsea for a day or two, hoping to see that strange namesake of mine who had shown so much inhospitality. For she must have been at home when we made that pressing call, inasmuch as there was no other place to hide her within the needful distance of the spot where she had stood. But the longer I waited, the less would she come out—to borrow the good Irishman's expression—and the Major's pillar-box, her favorite resort, was left in conspicuous solitude. And when a letter came from Sir Montague Hockin, asking leave to be at Bruntlands on the following evening, I packed up my goods with all haste, and set off, not an hour too soon, for Shoxford.

But before taking leave of these kind friends, I begged them to do for me one little thing, without asking me to explain my reason, which, indeed, was more than I could do. I begged them, not of course to watch Sir Montague, for that they could not well do to a guest, but simply to keep their eyes open and prepared for any sign of intercourse, if such there were, between this gentleman and that strange interloper. Major Hockin stared, and his wife looked at me as if my poor mind must have gone astray, and even to myself my own thought appeared

absurd. Remembering, however, what Sir Montague had said, and other little things as well, I did not laugh as they did. But perhaps one part of my conduct was not right, though the wrong (if any) had been done before that—to wit, I had faithfully promised Mrs. Price not to say a word at Bruntlands about their visitor's low and sinful treachery toward my cousin. To give such a promise had perhaps been wrong, but still without it I should have heard nothing of matters that concerned me nearly. And now it seemed almost worse to keep than to break such a pledge, when I thought of a pious, pure-minded, and holy-hearted woman, like my dear "Aunt Mary," unwittingly brought into friendly contact with a man of the lowest nature. And as for the Major, instead of sitting down with such a man to dinner, what would he have done but drive him straightway from the door, and chase him to the utmost verge of his manor with the peak end of his "geological hammer?"

However, away I went without a word against that contemptible and base man, toward whom—though he never had injured me—I cherished, for my poor cousin's sake, the implacable hatred of virtuous youth. And a wild idea had occurred to me (as many wild ideas did now in the crowd of things gathering round me) that this strange woman, concealed from the world, yet keenly watching some members of it, might be that fallen and miserable creature who had fled from a good man with a bad one, because he was more like herself—Flittamore, Lady Castlewood. Not that she could be an "old woman" yet, but she might look old, either by disguise, or through her own wickedness; and every body knows how suddenly those southern beauties fall off, alike in face and figure. Mrs. Price had not told me what became of her, or even whether she was dead or alive, but merely said, with a meaning look, that she was "punished" for her sin, and I had not ventured to inquire how, the subject being so distasteful.

To my great surprise, and uneasiness as well, I had found at Bruntlands no letter whatever, either to the Major or myself, from Uncle Sam or any other person at the saw-mills. There had not been time for any answer to my letter of some two months back, yet being alarmed by the Sawyer's last tidings, I longed, with some terror, for later news. And all the United Kingdom was now watching with tender interest the dismemberment, as it almost appeared, of the other mighty Union. Not with malice, or snug satisfaction, as the men of the North in their agony said, but certainly without any proper anguish yet, and rather as a genial and sprightly spectator, whose love of fair play perhaps kindles his applause of the spirit and skill of the weaker side. "'Tis a

good fight—let them fight it out!" seemed to be the general sentiment; but in spite of some American vaunt and menace (which of late years had been galling) every true Englishman deeply would have mourned the humiliation of his kindred.

In this anxiety for news I begged that my letters might be forwarded under cover to the postmistress at Shoxford, and bearing my initials. For now I had made up my mind to let Mrs. Busk know whatever I could tell her. I had found her a cross and well-educated woman, far above her neighbors, and determined to remain so. Gossip, that universal leveler, theoretically she despised; and she had that magnificent esteem for rank which works so beautifully in England. And now when my good nurse reasonably said that, much as she loved to be with me, her business would allow that delight no longer, and it also came home to my own mind that money would be running short again, and small hope left in this dreadful civil war of our nugget escaping pillage (which made me shudder horribly at internal discord), I just did this—I dismissed Betsy, or rather I let her dismiss herself, which she might not have altogether meant to do, although she threatened it so often. For here she had nothing to do but live well, and protest against tricks of her own profession which she practiced as necessary laws at home; and so, with much affection, for the time we parted.

Mrs. Busk was delighted at her departure, for she never had liked to be criticised so keenly while she was doing her very best. And as soon as the wheels of Betsy's fly had shown their last spoke at the corner, she told me, with a smile, that her mind had been made up to give us notice that very evening to seek for better lodgings. But she could not wish for a quieter, pleasanter, or more easily pleased young lady than I was without any mischief-maker; and so, on the spur of the moment, I took her into my own room, while her little girl minded the shop, and there and then I told her who I was, and what I wanted.

And now she behaved most admirably. Instead of expressing surprise, she assured me that all along she had felt there was something, and that I must be somebody. Lovely as my paintings were (which I never heard, before or since, from any impartial censor), she had known that it could not be that alone which had kept me so long in their happy valley. And now she did hope I would do her the honor to stay beneath her humble roof, though entitled to one so different. And was the fairy ring in the church-yard made of all my family?

I replied that too surely this was so, and that nothing would please me better than to find, according to my stature, room to sleep inside it as soon as ever I should have

solved the mystery of its origin. At the moment this was no exaggeration, so depressing was the sense of fighting against the unknown so long, with scarcely any one to stand by me, or avenge me if I fell. And Betsy's departure, though I tried to take it mildly, had left me with a readiness to catch my breath.

But to dwell upon sadness no more than need be (a need as sure as hunger), it was manifest now to my wondering mind that once more I had chanced upon a good, and warm, and steadfast heart. Every body is said to be born, whether that happens by night or day, with a certain little widowed star, which has lost its previous mortal, concentrating from a billion billion of miles, or leagues, or larger measure, intense, but generally invisible, radiance upon him or her; and to take for the moment this old fable as of serious meaning, my star was to find bad facts at a glance, but no bad folk without long gaze.

CHAPTER XL.

THE MAN AT LAST.

THIS new alliance with Mrs. Busk not only refreshed my courage, but helped me forward most importantly. In truth, if it had not been for this I never could have borne what I had to bear, and met the perils which I had to meet. For I had the confidence of feeling now that here was some one close at hand, an intelligent person, and well acquainted with the place and neighborhood, upon whom I could rely for warning, succor, and, if the worst should come to the very worst, revenge. It is true that already I had Jacob Rigg, and perhaps the protector promised by my cousin; but the former was as ignorant as he was honest, and of the latter, as he made no sign, how could I tell any thing?

Above all things, Mrs. Busk's position, as mistress of the letters, gave me very great advantage both for offense and defense. For without the smallest breach of duty or of loyal honor she could see that my letters passed direct to me or from me, as the case might be, at the same time that she was bound to observe all epistles addressed to strangers or new-comers in her district, which extended throughout the valley. And by putting my letters in the Portsmouth bag, instead of that for Winchester, I could freely correspond with any of my friends without any one seeing name or postmark in the neighboring villages.

It is needless to say that I had long since explored and examined with great diligence that lonely spot where my grandfather met his terrible and mysterious fate. Not that there seemed to be any hope now, after almost nineteen years, of finding even any

token of the crime committed there. Only that it was natural for me, feeling great horror of this place, to seek to know it thoroughly.

For this I had good opportunity, because the timid people of the valley, toward the close of day, would rather trudge another half mile of the homeward road than save brave legs at the thumping cost of hearts not so courageous. For the planks were now called "Murder-bridge;" and every body knew that the red spots on it, which could never be seen by daylight, began to gleam toward the hour of the deed, and glowed (as if they would burn the wood) when the church clock struck eleven.

This phenomenon was beyond my gifts of observation; and knowing that my poor grandfather had scarcely set foot on the bridge, if ever he set foot there at all—which at present was very doubtful—also that he had fallen backward, and only bled internally, I could not reconcile tradition (however recent) with proven truth. And sure of no disturbance from the step of any native, here I often sat in a little bowered shelter of my own, well established up the rise, down which the path made zigzag, and screened from that and the bridge as well by sheaf of twigs and lop of leaves. It was a little forward thicket, quite detached from the upland copse, to which perhaps it had once belonged, and crusted up from the meadow slope with sod and mould in alternate steps. And being quite the elbow of a foreland of the meadow-reach, it yielded almost a "bird's-eye view" of the beautiful glade and the wandering brook.

One evening when I was sitting here, neither drawing, nor working, nor even thinking with any set purpose, but idly allowing my mind to rove, like the rivulet, without any heed, I became aware of a moving figure in the valley. At first it did not appear to me as a thing at all worth notice; it might be a very straightforward cow, or a horse, coming on like a stalking-horse, keeping hind-legs strictly behind, in direct desire of water. I had often seen those sweet things that enjoy four legs walking in the line of distance as if they were no better off than we are, kindly desiring, perhaps, to make the biped spectator content with himself. And I was content to admire this cow or horse, or whatever it might be, without any more than could be helped of that invidious feeling which has driven the human race now to establish its right to a tail, and its hope of four legs. So little, indeed, did I think of what I saw, that when among the hazel twigs, parted carelessly by my hand, a cluster of nuts hung manifest, I gathered it, and began to crack and eat, although they were scarcely ripe yet.

But while employed in this pleasant way, I happened to glance again through my

leafy screen, and then I distinguished the figure in the distance as that of a man walking rapidly. He was coming down the mill-stream meadow toward the wooden bridge, carrying a fishing rod, but clearly not intent on angling. For instead of following the course of the stream, he was keeping quite away from it, avoiding also the foot-path, or, at any rate, seeming to prefer the long shadows of the trees and the tufted places. This made me look at him, and very soon I shrank into my nest and watched him.

As he came nearer any one could tell that he was no village workman, bolder than the rest, and venturesome to cross the "Murder-bridge" in his haste to be at home. The fishing rod alone was enough to show this when it came into clearer view; for our good people, though they fished sometimes, only used rough rods of their own making, without any varnish or brass thing for the line. And the man was of different height and walk and dress from any of our natives.

"Who can he be?" I whispered to myself, as my heart began to beat heavily, and then seemed almost to stop, as it answered, "This is the man who was in the churchyard." Ignoble as it was, and contemptible, and vile, and traitorous to all duty, my first thought was about my own escape; for I felt that if this man saw me there he would rush up the hill and murder me. Within pistol-shot of the very place where my grandfather had been murdered—a lonely place, an unholy spot, and I was looking at the hand that did it.

The thought of this made me tremble so, though well aware that my death might ensue from a twig on the rustle, or a leaf upon the flutter, that my chance of making off unseen was gone ere I could seize it. For now the man was taking long strides over the worn-out planks of the bridge, disdain-ing the hand-rail, and looking upward, as if to shun sight of the footing. Advancing thus, he must have had his gaze point-blank upon my lair of leafage; but, luckily for me, there was gorse upon the ridge, and bracken and rag-thistles, so that none could spy up and through the footing of my lurking-place. But if any person could have spied me, this man was the one to do it. So carefully did he scan the distance and inspect the foreground, as if he were resolved that no eye should be upon him while he was doing what he came to do. And he even drew forth a little double telescope, such as are called "binoculars," and fixed it on the thicket which hid me from him, and then on some other dark places.

No effort would compose or hush the heavy beating of my heart; my lips were stiffened with dread of loud breath, and all power of motion left me. For even a puff of wind might betray me, the ruffle of a spray, or the

lifting of a leaf, or the random bounce of a beetle. Great peril had encompassed me ere now, but never had it grasped me as this did, and paralyzed all the powers of my body. Rather would I have stood in the midst of a score of Mexican rovers than thus in the presence of that one man. And yet was not this the very thing for which I had waited, longed, and labored? I scorned myself for this craven loss of nerve, but that did not enable me to help it. In this benumbed horror I durst not even peep at the doings of my enemy; but presently I became aware that he had moved from the end of the planks (where he stood for some time as calmly as if he had done nothing there), and had passed round the back of the hawthorn-tree, and gone down to the place where the body was found, and was making most narrow and minute search there. And now I could watch him without much danger, standing as I did well above him, while his eyes were steadfastly bent downward. And, not content with eyesight only, he seemed to be feeling every blade of grass or weed, every single stick or stone, craning into each cranny of the ground, and probing every clod with his hands. Then, after vainly searching with the very utmost care all the space from the hawthorn trunk to the meadow-leet (which was dry as usual), he ran, in a fury of impatience, to his rod, which he had stuck into the bank, as now I saw, and drew off the butt end, and removed the wheel, or whatever it is that holds the fishing line; and this butt had a long spike to it, shining like a halberd in a picture.

This made me shudder; but my spirit was returning, and therewith my power of reasoning, and a deep stir of curiosity. After so many years and such a quantity of searching, what could there still be left to seek for in this haunted and horrible place? And who was the man that was looking for it?

The latter question partly solved itself. It must be the murderer, and no other, whoever he might be among the many black spots of humanity. But as to the other point, no light could be thrown upon it, unless the search should be successful, and perhaps not even then. But now this anxiety, and shame of terror, made me so bold—for I can not call it brave—that I could not rest satisfied where I was, and instead of blessing every leaf and twig that hid me from the enemy, nothing would do for me but to creep nearer, in spite of that truculent long bright spike.

I thought of my father, and each fibre of my frame seemed to harden with vigor and fleetness. Every muscle of my body could be trusted now. I had always been remarkably light of foot. Could a man of that age catch me? It was almost as much as Firm Gundry could do, as in childish days I had

proved to him. And this man, although his hair was not gray, must be on the slow side of fifty now, and perhaps getting short of his very wicked breath. Then I thought of poor Firm, and of good Uncle Sam, and how they scorned poltroonery; and, better still, I thought of that great Power which always had protected me: in a word, I resolved to risk it.

But I had not reckoned upon fire-arms, which such a scoundrel was pretty sure to have; and that idea struck cold upon my valor. Nevertheless, I would not turn back. With no more sound than a field-mouse makes in the building of its silken nest, and feet as light as the step of the wind upon the scarcely ruffled grass, I quitted my screen, and went gliding down a hedge, or rather the residue of some old hedge, which would shelter me a little toward the hollow of the banks. I passed low places, where the man must have seen me if he had happened to look up; but he was stooping with his back to me, and working in the hollow of the dry water trough. He was digging with the long spike of his rod, and I heard the rattle of each pebble that he struck.

Before he stood up again, to ease his back and to look at the ground which he still had to turn, I was kneeling behind a short, close-branched holly, the very last bush of the hedge-row, scarcely fifteen yards from the hawthorn-tree. It was quite impossible to get nearer without coming face to face with him. And now I began again to tremble, but with a great effort conquered it.

The man was panting with his labor, and seemed to be in a vile temper too. He did not swear, but made low noises full of disappointment. And then he caught up his tool, with a savage self-control, and fell to again.

Now was my time to see what he was like, and engrave him on my memory. But, lo! in a moment I need not do that. The face was the bad image of my father's. A lowered, and vicious, and ill-bred image of a noble countenance—such as it was just possible to dream that my dear father's might have fallen to, if his mind and soul had plunged away from the good inborn and implanted in them. The figure was that of a tall strong man, with shoulders rather slouching, and a habit of keeping his head thrown back, which made a long chin look longer. Altogether he seemed a perilous foe, and perhaps a friend still more perilous.

Be he what he might, he was working very hard. Not one of all Uncle Sam's men, to my knowledge, least of all Martin, would have worked so hard. With his narrow and ill-adapted tool he contrived to turn over, in less than twenty minutes, the entire bed of the meadow-leet, or trough, for a length of about ten yards. Then he came to the mouth, where the water of the main stream lapped

back into it, and he turned up the bottom as far as he could reach, and waited for the mud he had raised to clear away. When this had flowed down with the stream, he walked in for some little distance till the pool grew deep; but in spite of all his labor, there was nothing.

Meanwhile the sunset glow was failing, and a gray autumnal haze crept up the tranquil valley. Shadows waned and faded into dimness more diffuse, and light grew soft and vague and vaporous. The gleam of water, and the gloss of grass, and deep relief of trees, began to lose their several phase and mingle into one large twilight blend. And cattle, from their milking sheds, came lowing for more pasture; and the bark of a shepherd's dog rang quick, as if his sheep were drowsy.

In the midst of innocent sights and sounds that murderer's heart misgave him. He left his vain quest off, and gazed, with fear and hate of nature's beauty; at the change from day to night which had not waited for him. Some touch of his childhood moved him perhaps, some thought of times when he played "I spy," or listened to twilight ghost tales; at any rate, as he rose and faced the evening, he sighed heavily.

Then he strode away; and although he passed me almost within length of his rod, there was little fear of his discovering me, because his mind was elsewhere.

It will, perhaps, be confessed by all who are not as brave as lions that so far I had acquitted myself pretty well in this trying matter. Horribly scared as I was at first, I had not allowed this to conquer me, but had even rushed into new jeopardy. But now the best part of my courage was spent; and when the tall stranger refixed his rod and calmly recrossed those ominous planks, I durst not set forth on the perilous errand of spying out his ways and tracking him. A glance was enough to show the impossibility in those long meadows of following without being seen in this stage of the twilight. Moreover, my nerves had been tried too long, and presence of mind could not last forever. All I could do, therefore, was to creep as far as the trunk of the hawthorn-tree, and thence observe that my enemy did not return by the way he had come, but hastened down the dusky valley.

One part of his labors has not been described, though doubtless a highly needful one. To erase the traces of his work, or at least obscure them to a careless eye, when he had turned as much ground as he thought it worth his while to meddle with, he trod it back again to its level as nearly as might be, and then (with a can out of his fishing basket) sluiced the place well with the water of the stream. This made it look to any heedless person, who would not descend to examine it, as if there had been nothing

more than a little reflux from the river, caused by a flush from the mill-pond. This little stratagem increased my fear of a cunning and active villain.

CHAPTER XLI.

A STRONG TEMPTATION.

Now it will be said, and I also knew, that there was nothing as yet, except most frail and feeble evidence, to connect that nameless stranger with the crime charged upon my father. Indeed, it might be argued well that there was no evidence at all, only inference and suspicion. That, however, was no fault of mine; and I felt as sure about it as if I had seen him in the very act. And this conclusion was not mine alone; for Mrs. Busk, a most clever woman, and the one who kept the post-office, entirely agreed with me that there could be no doubt on earth about it.

But when she went on to ask me what it was my intention to do next, for the moment I could do nothing more than inquire what her opinion was. And she told me that she must have a good night's rest before advising any thing. For the thought of having such a heinous character in her own delivery district was enough to unhinge her from her postal duties, some of which might be useful to me.

With a significant glance she left me to my own thoughts, which were sad enough, and too sad to be worth recording. For Mrs. Busk had not the art of rousing people and cheering them, such as Betsy Strouss, my old nurse, had, perhaps from her knowledge of the nursery. My present landlady might be the more sagacious and sensible woman of the two, and therefore the better adviser; but for keeping one up to the mark she was not in any way equal to Betsy.

There is no ingratitude in saying this, because she herself admitted it. A clever woman, with a well-balanced mind, knows what she can do, and wherein she fails, better than a man of her own proportion does. And Mrs. Busk often lamented, without much real mortification, that she had not been "born sympathetic."

All the more perhaps for that, she was born sagacious, which is a less pleasing, but, in a bitter pinch, a more really useful, quality. And before I had time to think much of her defects, in the crowd of more important thought, in she came again, with a letter in her hand, and a sparkle of triumph in her small black eyes. After looking back along the passage, and closing my door, she saw that my little bay-window had its old-fashioned shutters fastened, and then, in a very low whisper, she said, "What you want to know is here, miss."

"Indeed!" I answered, in my usual voice. "How can you know that? The letter is sealed."

"Hush! Would you have me ruined for your sake? This was at the bottom of the Nepheton bag. It fell on the floor. That was God's will, to place it in your power."

"It is not in my power," I answered, whispering in my turn, and staring at it, in the strong temptation. "I have no right even to look at it. It is meant for some one else, and sealed."

"The seal is nothing. I can manage that. Another drop of wax—and I strike our stamp by accident over the breakage. I refuse to know any thing about it. I am too busy with the other letters. Five minutes—lock the door—and I will come again."

This was a desperate conflict for me, worse even than bodily danger. My first impulse was to have nothing to do with it—even to let the letter lie untouched, and, if possible, unglanced at. But already it was too late for the eyes to turn away. The address had flashed upon me before I thought of any thing, and while Mrs. Busk held it up to me. And now that address was staring at me, like a contemptuous challenge, while the seal, the symbol of private rights and deterrent honor, lay undermost. The letter was directed to "H. W. C., Post-office, Newport, Sussex." The writing was in round hand, and clear, so as not to demand any scrutiny, and to seem like that of a lawyer's clerk, and the envelope was of thin repellent blue.

My second impulse was to break the letter open and read it without shrinking. Public duty must conquer private scruples. Nothing but the hand of Providence itself could have placed this deadly secret in my power so amazingly. Away with all squeamishness, and perhaps prevent more murder.

But that "perhaps" gave me sudden pause. I had caught up the letter, and stood near the candle to soften the wax and lift the cover with a small sharp paper-knife, when it flashed on my mind that my cousin would condemn and scorn what I was doing. Unconsciously I must have made him now my standard of human judgment, or what made me think of him at that moment? I threw down the letter, and then I knew. The image of Lord Castlewood had crossed my mind, because the initials were his own—those of Herbert William Castlewood. This strange coincidence—if it were, indeed, an accident—once more set me thinking. Might not this letter be from his agent, of whom he had spoken as my protector here, but to whom as all unseen I scarcely ever gave a thought? Might not young Stixon, who so often was at Bruntsea, be employed to call at Newport for such letters, and return with them to his master? It was not very likely, for my cousin had the strongest contempt of anonymous doings. Still it was

possible, and the bare possibility doubled my reluctance to break the seal.

For one minute longer I stood in doubt, and then honor and candor and truth prevailed. If any other life had been in peril but my own, duty to another might have overridden all. But duty to one's self, if overpushed in such a case, would hold some taint of cowardice. So I threw the letter, with a sense of loathing, on a chair. Whatever it might contain, it should pass, at least for me, inviolate.

Now when Mrs. Busk came to see what I had done, or rather left undone, she flew into a towering passion, until she had no time to go on with it. The rattle of the rickety old mail-cart, on its way to Winchester that night, was heard, and the horn of the driver as he passed the church.

"Give it me. 'A mercy! A young natural, that you are!" the good woman cried, as she flung out of the room to dash her office stamp upon that hateful missive, and to seal the leathern bag. "Seal, indeed! Inviolable! How many seals have I got to make every day of my life?"

I heard a great thump from the corner of the shop where the business of the mails was conducted; and she told me afterward that she was so put out, that broken that seal should be—one way or another. Accordingly she smashed it with the office stamp, which was rather like a woman's act, methought; and then, having broken it, she never looked inside—which, perhaps, was even more so.

When she recovered her leisure and serenity, and came in, to forgive me and be forgiven, we resolved to dismiss the moral aspect of the question, as we never should agree about it, although Mrs. Busk was not so certain as she had been, when she found that the initials were the initials of a lord. And then I asked her how she came to fix upon that letter among so many others, and to feel so sure that it came from my treacherous enemy.

"In the first place, I know every letter from Nepheton," she answered, very sensibly. "There are only fourteen people that write letters in the place, and twelve of those fourteen buy their paper in my shop—there is no shop at all at Nepheton. In the next place, none of them could write a hand like that, except the parson and the doctor, who are far above disguise. And two other things made me certain as could be. That letter was written at the 'Green Man' ale-house; not on their paper, nor yet with their ink; but being in great hurry, it was dusted with their sand—a sand that turns red upon ink, miss. And the time of dispatch there is just what he would catch, by walking fast after his dig where you saw him, going in that direction too, and then having his materials ready to save time. And if all that

is not enough to convince you, miss—you remember that you told me our old sexton's tale?"

"To be sure I do. The first evening I was left alone here. And you have been so kind, there is nothing I would hide from you."

"Well, miss, the time of old Jacob's tale is fixed by the death of poor old Sally Mock; and the stranger came again after you were here, just before the death of the miller's eldest daughter, and you might almost have seen him. Poor thing! we all called her the 'flower of the Moon,' meaning our little river. What a fine young woman she was, to be sure! Whenever we heard of any strangers about, we thought they were prowling after her. I was invited to her funeral, and I went, and nothing could be done nicer. But they never will be punctual with burials here; they like to dwell on them, and keep the bell going, for the sake of the body, and the souls that must come after it. And so, when it was done, I was twenty minutes late for the up mail and the cross-country post, and had to move my hands pretty sharp, I can assure you. That doesn't matter; I got through it, with the driver of the cart obliging, by means of some beer and cold bacon. But what I feared most was the Nepheton bag, having seen the old man at the funeral, and knowing what they do afterward. I could not return him 'too late' again, or he would lose his place for certain, and a shilling a day made all the difference to him, between wife and no wife. The old pair without it must go to the work-house, and never see one another. However, when I was despairing quite of him, up he comes with his bag quite correct, but only one letter to sort in it, and that letter was, miss, the very identical of the one you held in your hands just now. And a letter as like it as two peas had come when we buried old Sally. It puzzled me then, but I had no clue to it; only now, you see, putting this and that together, the things we behold must have some meaning for us; and to let them go without it is against the will of God; especially when at the bottom of the bag."

"If you hear so soon of any stranger in the valley," I asked, to escape the re-opening of the opening question, "how can that man come and go—a man of remarkable stature and appearance—without any body asking who he is?"

"You scarcely could have put it better, miss, for me to give the answer. They do ask who he is, and they want to know it, and would like any body to tell them. But being of a different breed, as they are, from all outside the long valley, speaking also with a different voice, they fear to talk so freely out of their own ways and places. Any thing they can learn in and out among

themselves, they will learn; but any thing out of that they let go, in the sense of outlandish matter. Bless you, miss, if your poor grandfather had been shot any where else in England, how different it would have been for him!"

"For us, you mean, Mrs. Busk. Do you think the man who did it had that in his mind?"

"Not unless he knew the place, as few know it. No, that was an accident of his luck, as many other things have been. But the best luck stops at last, Miss Erema; and unless I am very much mistaken, you will be the stop of his. I shall find out, in a few days, where he came from, where he staid, and when he went away. I suppose you mean to let him go away?"

"What else am I to do?" I asked. "I have no evidence at all against him; only my own ideas. The police would scarcely take it up, even if—"

"Oh, don't talk of them. They spoil every thing. And none of our people would say a word, or care to help us, if it came to that. The police are all strangers, and our people hate them. And, indeed, I believe that the worst thing ever done was the meddling of that old Jobbins. The old stupe is still alive at Petersfield, and as pompous-headed as ever. My father would have been the man for your sad affair, miss, if the police had only been invented in his time. Ah, yes, he was sharp! Not a Moonstock man—you may take your oath of that, miss—but a good honest native from Essex. But he married my mother, a Moonstock woman; or they would not put up with me here at all. You quality people have your ideas to hold by, and despise all others, and reasonable in your opinions; but you know nothing—nothing—nothing—of the stiffness of the people under you."

"How should I know any thing of that?" I answered; "all these things are new to me. I have not been brought up in this country, as you know. I come from a larger land, where your stiffness may have burst out into roughness, from having so much room suddenly. But tell me what you think now your father would have done in such a case as mine is."

"Miss Erema, he was that long-headed that nobody could play leap-frog with him. None of them ever cleared over his barrel. He walked into this village fifty-five years back, this very month, with his spade upon his shoulder and the knowledge of every body in his eye. They all put up against him, but they never put him down; and in less than three months he went to church, I do assure you, with the only daughter of the only baker. After that he went into the baking line himself; he turned his spade into a shovel, as he said, and he introduced new practices."

"Oh, Mrs. Busk, not adulteration?"

"No, miss, no! The very last thing he would think of. Only the good use of potatoes in the bread, when flour was frightful bad and painful dear. What is the best meal of the day? he used to reason. Dinner. And why? Why, because of the potatoes. If I can make people take potato for their breakfast, and potato for their supper too, I am giving them three meals a day instead of one. And the health of the village corresponded to it."

"Oh, but, Mrs. Busk, he might have made them do it by persuasion, or at least with their own knowledge—"

"No, miss, no! The whole nature of our people, Moonstock or out of it, is never to take victuals by any sort of persuasion. If St. Paul was to come and preach, 'Eat this or that,' all I had of it in the shop would go rotten. They hate any meddling with their likings, and they suspect doctor's rubbish in all of it."

"I am quite of their opinion," I replied; "and I am glad to hear of their independence. I always used to hear that in England none of the poor people dared have a will of their own."

Mrs. Busk lifted up her hands to express amazement at my ignorance, and said that she "must run away and put the shutters up, or else the policeman would come rapping, and look for a glass of beer, which he had no right to till it came to the bottom of the firkin; and this one was only tapped last Sunday week. Don't you ever think of the police, miss."

Probably this was good advice, and it quite agreed with the opinions of others, and my own impressions as to the arrogant lethargy of "the force," as they called themselves, in my father's case. Mrs. Busk had more activity and intelligence in her little head than all the fat sergeants and inspectors of the county, helmet, belt, and staff, and all.

CHAPTER XLII.

MASTER WITHYPOOL.

AT first I was much inclined to run for help, or at least for counsel, either to Lord Castlewood or to Major Hockin; but further consideration kept me from doing any thing of the kind. In the first place, neither of them would do much good; for my cousin's ill health would prevent him from helping me, even if his strange view of the case did not, while the excellent Major was much too hot and hasty for a delicate task like this. And, again, I might lose the most valuable and important of all chances by being away from the spot just now. And so I remained at Shoxford for a while, keeping strict watch upon the stranger's haunt,

and asking about him by means of Mrs. Busk.

"I have heard more about him, miss," she said one day, when the down letters had been dispatched, which happened about middle-day. "He has been here only those three times this summer, upon excuse of fishing always. He stays at old Wellham, about five miles down the river, where the people are not true Moonites. And one thing that puzzles them is, that although he puts up there simply for the angling, he always chooses times when the water is so low that to catch fish is next to impossible. He left his fishing quarters upon the very day after you saw him searching so; and he spoke as if he did not mean to come again this season. And they say that they don't want him neither, he is such a morose, close-fisted man; and drinking nothing but water, there is very little profit with him."

"And did you find out what his name is? How cleverly you have managed!"

"He passes by the name of 'Captain Brown;' but the landlord of his inn, who has been an old soldier, is sure he was never in the army, nor any other branch of the service. He thinks that he lives by inventing things, for he is always at some experiments, and one of his great points is to make a lamp that will burn and move about under water. To be sure you see the object of that, miss?"

"No, really, Mrs. Busk, I can not. I have not your penetration."

"Why, of course, to find what he can not find upon land. There is something of great importance there, either for its value or its meaning. Have you ever been told that your poor grandfather wore any diamonds or precious jewels?"

"No. I have asked about that most especially. He had nothing about him to tempt a robber. He was a very strong-willed man, and he hated outward trumpery."

"Then it must be something that this man himself has dropped, unless it were a document, or any other token, missing from his lordship. And few things of that sort would last for twenty years almost."

"Nineteen years the day after to-morrow," I answered, with a glance at my pocket-book. "I determined to be here on that very day. No doubt I am very superstitious. But one thing I can not understand is this—what reason can there have been for his letting so many years pass, and then hunting like this?"

"No one can answer that question, miss, without knowing more than we know. But many reasons might be supposed. He might have been roving abroad, for instance, just as you and your father have been. Or he might not have known that the thing was

there; or it might not have been of importance till lately; or he might have been afraid, until something else happened. Does he know that you are now in England?"

"How can I possibly tell, Mrs. Busk? He seems to know a great deal too much. He found me out when I was at Colonel Gundry's. At least I conclude so, from what I know now; but I hope he does not know"—and at such a dreadful idea I shuddered.

"I am almost sure that he can not know it," the good postmistress answered, "or he would have found means to put an end to you. That would have been his first object."

"But, Mrs. Busk," I said, being much disturbed by her calmness, "surely, surely he is not to be allowed to make an end of every one! I came to this country with the full intention of going into every thing. But I did not mean at all, except in my very best moments, to sacrifice myself. It seems too bad—too bad to think of."

"So it is, Miss Erema," Mrs. Busk replied, without any congenial excitement. "It does seem hard for them that have the liability on them. But still, miss, you have always shown such a high sense of duty, and of what you were about—"

"I can't—I can not. There are times, I do assure you, when I am fit for nothing, Mrs. Busk, and wish myself back in America. And if this man is to have it all his own way—"

"Not he, miss—not he. Be you in no hurry. Could he even have his way with our old miller? No; Master Withypool was too many for him."

"That is a new thing. You never told me that. What did he try to do with the miller?"

"I don't justly know what it was, Miss Erema. I never spoke to miller about it, and, indeed, I have had no time since I heard of it. But those that told me said that the tall strange gentleman was terribly put out, and left the gate with a black cloud upon his face, and the very next day the miller's daughter died, quite sudden and mysterious."

"How very strange! But now I have got a new idea. Has the miller a strong high dam to his pond, and a good stout sluice-gate at the end?"

"Yes, miss, to be sure he has," said Mrs. Busk; "otherwise how could he grind at all, when the river is so low as it is sometimes?"

"Then I know what he wanted, and I will take a leaf out of his own book—the miscreant! He wanted the miller to stop back the water and leave the pool dry at the 'Murder-bridge.' Would it be possible for him to do that?"

"I can not tell you, miss; but your thought is very clever. It is likely enough that he did want that, though he never

would dare to ask without some pretense—some other cause I mean, to show for it. He may have been thinking that whatever he was wanting was likely to be under water. And that shows another thing, if it is so."

"Mrs. Busk, my head goes round with such a host of complications. I do my best to think them out—and then there comes another!"

"No, miss; this only clears things up a little. If the man can not be sure whether what he is looking for is on land or under water, it seems to me almost to show that it was lost at the murder time in the dark and flurry. A man would know if he dropped any thing in the water by daylight, from the splash and the ripple, and so on, for the stream is quite slow at that corner. He dropped it, miss, when he did the deed, or else it came away from his lordship."

"Nothing was lost, as I said before, from the body of my grandfather, so far at least as our knowledge goes. Whatever was lost was the murderer's. Now please to tell me all about the miller, and how I may get round him."

"You make me laugh in the middle of black things, miss, by the way you have of putting them. But as to the miller—Master Withypool is a wonder, as concerns the ladies. He is one of those men that stand up for every thing when a man tries upper side of them. But let a woman come, and get up under, and there he is—a pie crust lifted. Why, I, at my age, could get round him, as you call it. But you, miss—and more than that, you are something like his daughter; and the old man frets after her terrible. Go you into his yard, and just smile upon him, miss, and if the Moon River can be stopped, he'll stop it for you."

This seemed a very easy way to do it. But I told Mrs. Busk that I would pay well also, for the loss of a day's work at the mill was more than fifty smiles could make up.

But she told me, above all things, not to do that. For old Master Withypool was of that sort that he would stand for an hour with his hands in his pocket for a half-penny, if not justly owing from him. But nothing more angered him than a bribe to step outside of his duty. He had plenty of money, and was proud of it. But sooner would he lose a day's work to do a kindness, when he was sure of having right behind it, than take a week's profit without earning it. And very likely that was where the dark man failed, from presuming that money would do every thing. However, there was nothing like judging for one's self; and if I would like to be introduced, she could do it for me with the best effect; taking as she did a good hundred-weight of best "households" from him every week, although not

herself in the baking line, but always keeping quartern bags, because the new baker did adulterate so.

I thought of her father, and how things work round; but that they would do without remarks of mine. So I said nothing on that point, but asked whether Master Withypool would require any introduction. And to this Mrs. Busk said, "Oh dear, no!" And her throat had been a little rough since Sunday, and the dog was chained tight, even if any dog would bite a sweet young lady; and to her mind the miller would be more taken up and less fit to vapor into obstacles, if I were to hit upon him all alone, just when he came out to the bank of his cabbage garden, not so very long after his dinner, to smoke his pipe and to see his things a-growing.

It was time to get ready if I meant to catch him then, for he always dined at one o'clock, and the mill was some three or four meadows up the stream; therefore as soon as Mrs. Busk had re-assured me that she was quite certain of my enemy's departure, I took my drawing things and set forth to call upon Master Withypool.

Passing through the church-yard, which was my nearest way, and glancing sadly at the "fairy ring," I began to have some uneasiness about the possible issue of my new scheme. Such a thing required more thinking out than I had given to it. For instance, what reason could I give the miller for asking so strange a thing of him? And how could the whole of the valley be hindered from making the greatest talk about the stoppage of their own beloved Moon, even if the Moon could be stopped without every one of them rushing down to see it? And if it was so talked of, would it not be certain to come to the ears of that awful man? And if so, how long before he found me out, and sent me to rejoin my family?

These thoughts compelled me to be more discreet; and having lately done a most honorable thing, in refusing to read that letter, I felt a certain right to play a little trick now of a purely harmless character. I ran back therefore to my writing-desk, and took from its secret drawer a beautiful golden American eagle, a large coin, larger and handsomer than any in the English coinage. Uncle Sam gave it to me on my birthday, and I would not have taken £50 for it. With this I hurried to that bridge of fear, which I had not yet brought myself to go across; and then, not to tell any story about it, I snipped a little hole in the corner of my pocket, while my hand was still steady ere I had to mount the bridge. Then pinching that hole up with a squeeze, I ran and got upon that wicked bridge, and then let go. The heavy gold coin fell upon the rotten plank, and happily rolled into the water, as if it were glad not to tempt

its makers to any more sin for the sake of it.

Shutting up thought, for fear of despising myself for the coinage of such a little trick, I hurried across the long meadow to the mill, and went through the cow-gate into the yard, and the dog began to bark at me. Seeing that he had a strong chain on, I regarded him with lofty indignation. "Do you know what Jowler would do to you?" I said; "Jowler, a dog worth ten of you. He would take you by the neck and drop you into that pond for daring to insult his mistress!" The dog appeared to feel the force of my remarks, for he lay down again, and with one eye watched me in a manner amusing, but insidious. Then, taking good care to keep out of his reach, I went to the mill-pond and examined it.

It looked like a very nice pond indeed, long, and large, and well banked up, not made into any particular shape, but producing little rushy elbows. The water was now rather low, and very bright (though the Moon itself is not a crystal stream), and a school of young minnows, just watching a water-spider with desirous awe, at sight of me broke away, and reunited, with a speed and precision that might shame the whole of our very best modern fighting. Then many other things made a dart away, and furrowed the shadow of the willows, till distance quieted the fear of man—that most mysterious thing in nature—and the shallow pool was at peace again, and bright with unruffled reflections.

"What ails the dog?" said a deep gruff voice; and the poor dog received a contemptuous push, not enough to hurt him, but to wound his feelings for doing his primary duty. "Servant, miss. What can I do for you? Foot-path is t'other side of that there hedge."

"Yes, but I left the foot-path on purpose. I came to have a talk with you, if you will allow me."

"Sartain! sartain," the miller replied, lifting a broad floury hat and showing a large gray head. "Will you come into house, miss, or into gearden?"

I chose the garden, and he led the way, and set me down upon an old oak bench, where the tinkle of the water through the flood-gates could be heard.

"So you be come to paint the mill at last," he said. "Many a time I've looked out for you. The young leddy down to Mother Busk's, of course. Many's the time we've longed for you to come, you reminds us so of somebody. Why, my old missus can't set eyes on you in church, miss, without being forced to sit down a'most. But we thought it very pretty of you not to come, miss, while the trouble was so new upon us."

Something in my look or voice made the old man often turn away, while I told him

that I would make the very best drawing of his mill that I could manage, and would beg him to accept it.

"Her ought to 'a been on the plank," he said, with trouble in getting his words out. "But there! what good? Her never will stand on that plank no more. No, nor any other plank."

I told him that I would put her on the plank, if he had any portrait of her showing her dress and her attitude. Without saying what he had, he led me to the house, and stood behind me, while I went inside. And then he could not keep his voice as I went from one picture of his darling to another, not thinking (as I should have done) of what his feelings might be, but trying, as no two were at all alike, to extract a general idea of her.

"Nobody knows what her were to me," the old man said, with a quiet little noise and a sniff behind my shoulder. "And with one day's illness her died—her died."

"But you have others left. She was not the only one. Please, Mr. Withypool, to try to think of that. And your dear wife still alive to share your trouble. Just think for a moment of what happened to my father. His wife and six children all swept off in a month—and I just born, to be brought up with a bottle!"

I never meant, of course, to have said a word of this, but was carried away by that common old idea of consoling great sorrow with a greater one. And the sense of my imprudence broke vexatiously upon me when the old man came and stood between me and his daughter's portraits.

"Well, I never!" he exclaimed, with his bright eyes steadfast with amazement. "I know you now, miss. Now I knows you. To think what a set of blind newts us must be! And you the very moral of your poor father, in a female kind of way! To be sure, how well I knew the Captain! A nicer man never walked the earth, neither a more unlucky one."

"I beg you—let me beg you," I began to say; "since you have found me out like this—"

"Hush, miss, hush! Not my own wife shall know, unless your own tongue telleth her. A proud man I shall be, Miss Raumur," he continued, with emphasis on my local name, "if aught can be found in my power to serve you. Why, Lord bless you, miss," he whispered, looking round, "your father and I has spent hours together! He were that pleasant in his ways and words, he would drop in from his fishing, when the water was too low, and sit on that very same bench where you sat, and smoke his pipe with me, and tell me about battles, and ask me about bread. And many a time I have slipped up the gate, to give him more water for his flies to play, and the fish not to see him so plain-

ly. Ah, we have had many pleasant spells together; and his eldest boy and girl, Master George and Miss Henrietta, used to come and fetch our eggs. My Polly there was in love with him, we said; she sat upon his lap so, when she were two years old, and played with his beautiful hair, and blubbered—oh, she did blubber, when the Captain went away!"

This invested Polly with new interest for me, and made me determine to spare no pains in putting her pretty figure well upon the plank. Then I said to the miller, "How kind of you to draw up your sluice-gates to oblige my father! Now will you put them down and keep them down, to do a great service both to him and me?"

Without a moment's hesitation, he promised that any thing he could do should be done, if I would only tell him what I wanted. But perhaps it would be better to have our talk outside. Taking this hint, I followed him back to the bench in the open garden, and there explained what I wished to have done, and no longer concealed the true reason. The good miller answered that with all his heart he would do that much to oblige me, and a hundred times more than that; but some little thought and care were needful. With the river so low as it was now, he could easily stop the back-water, and receive the whole of the current in his dam, and keep it from flowing down his wheel trough, and thus dry the lower channel for perhaps half an hour, which would be ample for my purpose. Engineering difficulties there were none; but two or three other things must be heeded. Miller Sims, a mile or so down river, must be settled with, to fill his dam well, and begin to discharge, when the upper water failed, so as not to dry the Moon all down the valley, which would have caused a commotion. Miller Sims being own brother-in-law to Master Withypool, that could be arranged easily enough, after one day's notice. But a harder thing to manage would be to do the business without rousing curiosity, and setting abroad a rumor which would be sure to reach my enemy. And the hardest thing of all, said Master Withypool, smiling as he thought of what himself had once been, would be to keep those blessed boys away, who find out every thing, and go every where. Not a boy of Shoxford but would be in the river, or dancing upon its empty bed, screeching and scolloping up into his cap any poor bewildered trout chased into the puddles, if it were allowed to leak out, however feebly, that the Moon water was to stop running. And then how was I to seek for any thing?

This was a puzzle. But, with counsel, we did solve it. And we quietly stopped the Moon, without man or boy being much the wiser.

CHAPTER XLIII.

GOING TO THE BOTTOM.

It is not needful to explain every thing, any more than it was for me to tell the miller about my golden eagle, and how I had managed to lose it in the Moon—a trick of which now I was heartily ashamed, in the face of honest kindness. So I need not tell how Master Withypool managed to settle with his men, and to keep the boys unwitting of what was about to come to pass. Enough that I got a note from him to tell me that the little river would be run out, just when all Shoxford was intent upon its dinner, on the second day after I had seen him. And he could not say for certain, but thought it pretty safe, that nobody would come near me, if I managed to be there at a quarter before one, when the stream would begin to run dry, and I could watch it. I sent back a line by the pretty little girl, a sister of poor Polly, to say how much I thanked him, and how much I hoped that he himself would meet me there, if his time allowed. For he had been too delicate to say a word of that; but I felt that he had a good right to be there, and, knowing him now, I was not afraid.

Nearly every thing came about as well as could be wished almost. Master Withypool took the precaution, early in the morning, to set his great fierce bull at large, who always stopped the foot-path. This bull knew well the powers of a valley in conducting sound; and he loved to stand, as if at the mouth of a funnel, and roar down it to another bull a mile below him, belonging to his master's brother-in-law. And when he did this, there was scarcely a boy, much less a man or woman, with any desire to assert against him the public right of thoroughfare. Throughout that forenoon, then, this bull bellowed nobly, still finding many very wicked flies about, so that two mitching boys, who meant to fish for minnows with a pin, were obliged to run away again.

However, I was in the dark about him, and as much afraid of him as any body, when he broke into sight of me round a corner, without any tokens of amity. I had seen a great many great bulls before, including Uncle Sam's good black one, who might not have meant any mischief at all, and atoned for it—if he did—by being washed away so.

And therefore my courage soon returned, when it became quite clear that this animal now had been fastened with a rope, and could come no nearer. For some little time, then, I waited all alone, as near that bridge as I could bring myself to stand, for Mrs. Busk, my landlady, could not leave the house yet, on account of the mid-day letters. Moreover, she thought that she had better stay away, as our object was to do things as quietly as could be.

Much as I had watched this bridge from a distance, or from my sheltering-place, I had never been able to bring myself to make any kind of sketch of it, or even to insert it in a landscape, although it was very well suited and expressive, from its crooked and antique simplicity. The overhanging, also, of the hawthorn-tree (not ruddy yet, but russety with its coloring crop of coral), and the shaggy freaks of ivy above the twisted trunk, and the curve of the meadows and bold elbow of the brook, were such as an artist would have pitched his tent for, and tantalized poor London people with a dream of cool repose.

As yet the little river showed no signs of doing what the rustic—or surely it should have been the cockney—was supposed to stand still and wait for. There was no great rush of headlong water, for that is not the manner of the stream in the very worst of weather; but there was the usual style of coming on, with lips and steps at the sides, and cords of running toward the middle. Quite enough, at any rate, to make the trout jump, without any omen of impending drought, and to keep all the play and the sway of movement going on serenely.

I began to be afraid that the miller must have failed in his stratagem against the water-god, and that, as I had read in Pope's Homer, the liquid deity would beat the hero, when all of a sudden there were signs that man was the master of this little rustic. Broadswords of flag and rapiers of water-grass, which had been quivering merrily, began to hang down and to dip themselves in loops, and the stones of the brink showed dark green stripes on their sides as they stood naked. Then fine little cakes of conglomerated stuff, which only a great man of nature could describe, came floating about, and curdling into corners, and holding on to one another in long-tailed strings. But they might do what they liked, and make their very best of it, as they fell away to nothing upon stones and mud. For now more important things began to open, the like of which never had been yielded up before—plots of slimy gravel, varied with long streaks of yellow mud, dotted with large double shells, and parted into little oozy runs by wriggling water-weeds. And here was great commotion and sad panic of the fish, large fellows splashing and quite jumping out of water, as their favorite hovers and shelves ran dry, and darting away, with their poor backs in the air, to the deepest hole they could think of. Hundreds must have come to flour, lard, and butter if boys had been there to take advantage. But luckily things had been done so well that boys were now in their least injurious moment, destroying nothing worse than their own dinners.

A very little way below the old wooden bridge the little river ran into a deepish pool, as generally happens at or near a corner, especially where there is a confluence sometimes. And seeing nothing, as I began to search intently, stirring with a long-handled spud which I had brought, I concluded that even my golden eagle had been carried into that deep place. However, water or no water, I resolved to have it out with that dark pool as soon as the rest of the channel should be drained, which took a tormenting time to do; and having thick boots on, I pinned up my skirts, and jumping down into the shoals, began to paddle in a fashion which reminded me of childish days passed pleasantly in the Blue River.

Too busy thus to give a thought to any other thing, I did not even see the miller, until he said,

"Good-day, miss," lifting his hat, with a nice kind smile. "Very busy, miss, I see, and right you are to be so. The water will be upon us again in less than half an hour. Now let me clear away they black weeds for you. I brought this little shivel a-purpose. If I may make so bold, miss, what do 'e look to find here?"

"I have not the very smallest notion," I could only answer; "but if there is any thing, it must be in that hole. I have searched all the shallow part so closely that I doubt whether even a sixpence could escape me, unless it were buried in the mud or pebbles. Oh, how can I manage to search that hole? There must be a yard of water there."

"One thing I ought to have told 'e for to do," Master Withypool whispered, as he went on shoveling—"to do what the boys do when they lose a farden—to send another after un. If so be now, afore the water was run out, you had stood on that there bridge, and dropped a bright coin into it, a new half crown or a two-shilling piece, why, the chances would be that the run of the current would 'a taken it nigh to the likeliest spot for holding any other little matter as might 'a dropped, permiskous, you might say, into this same water."

"I have done so," I answered; "I have done that very thing, though not at all with that object. The day before yesterday a beautiful coin, a golden eagle of America, fell from my pocket on that upper plank, and rolled into the water. I would not lose it for a great deal, because it was given to me by my dearest friend, the greatest of all millers."

"And ha'n't you found it yet, miss? Well, that is queer. Perhaps we shall find it now, with something to the back of it. I thought yon hole was too far below the bridge. But there your gold must be, and something else, most likely. Plaise to wait a little bit, and us 'll have the wet out of un. I never should

'a thought of that but for your gold guinea, though."

With these words Master Withypool pulled his coat off and rolled up his shirt sleeves, displaying arms fit to hold their own even with Uncle Sam's almost; and then he fell to with his shovel and dug, while I ran with my little spud to help.

"Plaise keep out of way, miss; I be afeard of knocking you. Not but what you works very brave indeed, miss."

Knowing what men are concerning "female efforts," I got out of the strong man's way, although there was plenty of room for me. What he wanted to do was plain enough—to dig a trench down the empty bed of the Moon River, deep enough to drain that pit before the stream came down again.

"Never thought to run a race against my own old dam," he said, as he stopped for a moment to recover breath. "Us never knows what us may have to do. Old dam must be a'most busting now. But her's sound enough, till her beginneth to run over."

I did not say a word, because it might have done some mischief, but I could not help looking rather anxiously up stream, for fear of the water coming down with a rush, as it very soon must do. Master Withypool had been working, not as I myself would have done, from the lips of the dark pit downward, but from a steep run some twenty yards below, where there was almost a little cascade when the river was full flowing; from this he had made his channel upward, cutting deeper as he came along, till now, at the brink of the obstinate pool, his trench was two feet deep almost. I had no idea that any man could work so with a shovel, which seems such a clumsy tool compared with a spade: but a gentleman who knows the country and the people told me that, with their native weapon, Moonites will do as much digging in an hour as other folk get through in an hour and a half with a spade. But this may be only, perhaps, because they are working harder.

"Now," said Master Withypool at last, standing up, with a very red face, and desiring to keep all that unheeded—"now, miss, to you it belongeth to tap this here little cornder, if desirable. Plaise to excoose of me going up of bank to tell 'e when the wet cometh down again."

"Please to do nothing of the sort," I answered, knowing that he offered to stand out of sight from a delicate dread of intrusion. "Please to tap the pool yourself, and stay here, as a witness of what we find in it."

"As you plaise, miss, as you plaise. Not a moment for to lose in arguing. Harken now, the water is atopping of our dam. Her will be here in five minutes."

With three or four rapid turns of his shovel, which he spun almost as fast as a house-maid spins a mop, he fetched out the

plug of earth severing his channel from the deep, reluctant hole. And then I saw the wisdom of his way of working: for if he had dug downward from the pool itself, the water would have followed him all the way, and even drowned his tool out of its own strokes; whereas now, with a swirl and a curl of ropy mud, away rushed the thick, sluggish, obstinate fluid, and in less than two minutes the hole was almost dry.

The first thing I saw was my golden eagle, lodged about half-way down the slope on a crust of black sludge, from which I caught it up and presented it to Master Withypool, as a small token and record of his kindness; and to this day he carries it upon his Sunday watch chain.

"I always am lucky in finding things," I exclaimed, while he watched me, and the up stream too, whence a babble of water was approaching. "As sure as I live I have found it!"

"No doubt about your living, miss. And the Captain were always lively. But what have your bright eyes hit upon? I see nort for the life of me."

"Look there," I cried, "at the very bottom of it—almost under the water. Here, where I put my spud—a bright blue line! Oh, can I go down, or is it quicksand?"

"No quicksand in our little river, miss. But your father's daughter shannot go into the muck, while John Withypool stands by. I see un now, sure enough; now I see un! But her needeth care, or her may all goo away in mullock. Well, I thought my eyes was sharp enough; but I'm blest if I should have spied that, though. A bit of flint, mebbe, or of blue glass bottle. Anyhow, us will see the bottom of un."

He was wasting no time while he spoke, but working steadfastly for his purpose, fixing the blade of his shovel below the little blue line I was peering at, so that no slip of the soft yellow slush should bury it down, and plunge over it. If that had once happened, good-by to all chance of ever beholding this thing again, for the river was coming, with fury and foam, to assert its ancient right of way.

With a short laugh the miller jumped down into the pit. "Me to be served so, by my own mill-stream! Lor', if I don't pay you out for this!"

His righteous wrath failed to stop the water from pouring into the pit behind him; and, strong as he was, he nearly lost his footing, having only mud to stand upon. It seemed to me that he was going to be drowned, and I offered him the handle of my spud to help him; but he stopped where he was, and was not going to be hurried.

"I got un now," he said; "now I don't mind coming out. You see if I don't pay you out for this! Why, I always took you for a reasonable hanimal."

He shook his fist strongly at the river, which had him well up to the middle by this time; and then he disdainfully waded out, with wrath in all his countenance.

"I've a great mind to stop there, and see what her would do," he said to me, forgetting altogether what he went for. "And I would, if I had had my dinner. A seat of a thing as I can manage with my thumb! Ah, you have made a bad day of it."

"But what have you found, Mr. Withypool?" I asked, for I could not enter into his wrath against the water, wet as he was to the shoulders. "You have something in your hand. May I see it, if you please? And then do please to go home and change your clothes."

"A thing I never did in my life, miss, and should be ashamed to begin at this age. Clothes gets wet, and clothes dries on us, same as un did on the sheep afore us; else they gets stiff and creasy. What this little thing is ne'er a body may tell, in my line of life—but look'th aristocratic."

The "mullock," as he called it, from his hands, and from the bed where it had lain so long, so crusted the little thing which he gave me, that I dipped it again in the swelling stream, and rubbed it with both hands, to make out what it was. And then I thought how long it had lain there; and suddenly to my memory it came, that in all likelihood the time of that was nineteen years this very day.

"Will another year pass," I cried, "before I make out all about it? What are you, and who, now looking at me with such sad, sad eyes?"

For I held in my hand a most handsome locket, of blue enamel and diamonds, with a back of chased gold, and in front the miniature of a beautiful young woman, done as they never seem to do them now. The work was so good, and the fitting so close, that no drop of water had entered, and the face shone through the crystal glass as fresh as the day it was painted. A very lovely face it was, yet touched with a shade of sadness, as the loveliest faces generally are; and the first thought of any beholder would be, "That woman was born for sorrow."

The miller said as much when I showed it to him.

"Lord bless my heart! I hope the poor craitur' hathn't lasted half so long as her pictur' hath."

REALITY.

FROM "MIRZA SCHIAFFY."

I SANG of woman's beauty;
I sang of foaming wine
And jolly midnight revels:
Resounding praise was mine.

But when, my song believing,
I dwelt in Beauty's bower,
And drained the flowing goblet,
Men scorned me from that hour.

VOODOO VIOLET.

A BICENTENNIAL STORY, IN THREE CHAPTERS.

CHAPTER I.

SOME OLD PAPERS.

NESTLED in one of the most charming valleys that lead to and border the Connecticut lies the village of Deepegrove. The turnpike makes a sharp curve around a mountain and comes upon it suddenly, as it lies hidden in the vale below, under spreading elms, whose thick leafage completely covers the single street of commodious, almost stately, American country-houses. Only in winter would you suspect the presence of a town, so effectually do the green arms of the guardian elms cover their infant charge—a baby that has grown old without increasing in size, for of elms and houses there are few which have not kept each other company for at least a hundred years, and some souvenirs which antedate the Revolution by more than a century. A bicentennial village, though by no means alone or pre-eminent in its boast, for Hadley, with its legend of the regicides, Bloody Brook, where Lothrop and “the flower of Essex” perished, Springfield, with its tale of witchcraft, and Deerfield’s ill-luck-bringing bell of St. Regis, are among its neighbors.

I had passed the winter in a Southern city, but spring was treading upon the skirts of summer, and one dusty, glaring day I bethought me of the cool shadows and quiet walks of Deepegrove, and escaping from the sultry South, and almost the only passenger in the great stage-coach, I slipped down the descending road to the little village, whose presence we knew from the summit of the hill only by its canopy of greenery. “Buried alive,” I said to myself, as I threaded its busiest street, which resembled one of the quietest of English lanes. The Catacombs are noisier than this quaint little Sleepy Hollow, and Pompeii carries on more of business enterprise. When a little tinge of loneliness and longing for human companionship came over me, as it not unfrequently did in Deepegrove, I went to the old burial-ground, the meeting-place of the first settlers of the town. Here was society enough, and close companionship, for the small “God’s-acre” was so closely filled that, could the sleepers have stretched out their arms under the daisies, they might have clasped each others’ hands caressingly in the darkness. I would lie in the warm sunlight, with my head pillowed on one of these nameless graves, wondering what life had brought to its occupant, tangling my fingers in the coarse grass, secure from observation, for these head-stones bore dates too ancient to interest the inhabitants of Deepegrove. All that told of recent grief, or that were erected

by any one now living, stood white and new in the orderly modern cemetery. In the old burial-ground was one grave that was a perfect bank of English violets. The blossoms were large, oppressively sweet, and darkly purple, almost black, quite different from the wild New England variety, that grew also within the grounds—a pale, faintly perfumed sisterhood, lifting their tiny, tear-washed eyes timidly beside their bolder, stronger cousins. There was no record of name or date above the grave, only a wooden head-board, on which some modern visitor had written, in pencil, these lines from Rev. Leigh Richmond:

“In heaven the land of glory lies;
If I should enter there,
I’ll tell the saints and angels too
Thou heardest a negro’s prayer.”

My landlady, Mrs. Hailstone, whom the necessity of answering the numerous inquiries of her summer boarders had rendered *au fait* in all matters of local tradition, told me that it was the grave of a negro witch; but whether she had suffered death for her sorceries in the good old time, she could not say, though she thought it quite probable.

History repeats itself, and so do types of character. I had left behind me in Louisiana a tall, powerfully formed negress of the jettiest Congo type, who had interested me much. The medium of our acquaintance had been her marvelous skill in fluting ruffles and “doing up” embroideries and laces. There seemed to be real magic in the metallic lustre of the shirt bosoms which left her hands, and she had the reputation among her own people of being a sorceress. Her name was Voodoo Violet. In conversation with her I became convinced that, however much of efficacy there might be in them, she, at all events, believed in her own charms and enchantments, and was therefore in one sense not an impostor. Her incantations seemed innocent enough, and aimed, for the most part, at the healing of the sick, the finding of lost articles, and the telling of fortunes. She was essentially a clairvoyant, and as I read over the old accounts of the developments of witchcraft in New England, vouched for by the most eminent divines of the day, I questioned seriously if all that was not imposture might not come under the head of clairvoyance and animal magnetism. Its manifestations resembled Voodooism, and the conduct of the bewitched was not unlike the vagaries of Violet when passing through a trance. I was puzzled at this resemblance, until one day, while reading a work on the Salem witchcraft, I found the statement that the witch tragedies originated with a circle of young girls who met at the house of the pastor to learn fortune-telling from a negress from the West Indies, Tituba by name. This

same negress figured largely in all the subsequent proceedings. Whittier's fair witch of Wenham was not the only one of whom

"Tituba, the Indian, saith,
At Quasycung she took
The Black Man's godless sacrament,
And signed his dreadful book."

By a curious chain of circumstance, the story of Violet, the witch of Deepegrove,

"How strange it is," I remarked to him one day, "that the original settlers should have given this village so appropriate a name as Deepegrove! These elms could hardly have been set out then. There really seems to be something prophetic in it."

My friend smiled. "The name is appropriate," he replied; "but the village was named for its founder and first pastor, Re-

"I WOULD LIE WITH MY HEAD PILLOWED ON ONE OF THESE NAMELESS GRAVES."

became known to me, bringing with it from the obscurity of the past another more romantic and happier. It would be far more interesting if I could transport you to that early day, and relate the events in the sequence and with the local coloring in which they occurred; but this I am not enough of an antiquarian to do; there would be many and manifest discrepancies and anachronisms which would seem to impeach the truth of the whole narrative, and I prefer to lay it before you in piecemeal, as I hunted it out, or as it was placed in my way by a magic which, for aught I know, may have been thrown upon it by a spell woven by Voodoo Violet herself.

My friends in Deepegrove were not confined to the ancient inhabitants of the town now at rest in the old burial-ground. Its present population numbers many peculiarly bright and interesting persons, one of the most cultivated among them being the young preceptor of the academy. He was an Englishman, and had just returned from spending his last vacation in his native land.

solv'd Deepegrove, with no thought of these trees. While making a trip through England last summer I saw that my route took me past a railway station of the same name, and having plenty of time at my disposal, I determined to stop for a day or two and make its acquaintance. I was attracted principally by the association of the name, but I found the place so charming, situated as it was near a castle of the same name, and boasting a picturesque old church, that I made a much longer stay than I had at first intended. I gained access to the church records, and found a mention of one of its clergymen, Mr. Ralph Deepegrove, a younger son of the lord of that name during the reign of Charles I., who had been so carried away by Puritan notions as to renounce the Church in which he had been educated, and who had possessed so much influence among his people as to entice many of them to the embracing of the same errors and the following him across seas to plant a colony in the wilds of Massachusetts. In token of his resolution, and in conformity to the cus-

tom of the day, he had changed his name from Ralph to Resolv'd. His flock followed his example. Subjoined to the account of the schism in the church records a list was given of the seceding members under their new names. It was so odd that I copied it, and you are welcome to glance it over, if you think it sufficiently interesting. As you will see, some of the names are most outrageous; indeed, I could not believe them authentic were it not for those still more absurd that we find in history."

The paper which my friend had copied seemed to have been sent to the mother church in England by the colonists as an assurance of the prosperity of those who, while they differed in religious faith, must still be dear to many at home. It stated that permission had been granted to Mr. Deepegrove by the General Court to purchase lands of the Indians upon the frontier, and begin a settlement, provided twenty men could be found willing to join in the enterprise; "and whereas," the chronicle went on to state, "but twelve men came with him out of England, yet has there been no lack, for other eight did join themselves unto us on this side, so that the following is a true list of all who do now compose our colony:

"Mr. Resolv'd Deepegrove, and Lettice his daughter, with two Blackamores out of New Spain. The same Mr. Deepegrove to act as Pastor, and in matters of small importance as Magistrate; in matters of greater note, the Worshipfull Major Pyncheon, of Agawam, to decide.

"Praisever Pococke, Phisition and Chirurgion, with Mercy Pococke his wife.

"Be-faithful Adams, Builder and Joiner, and Deborah his wife.

"Weep-not Billings, Blacksmith.

"More-fruit Bobbitt, Weaver, and Good-wife Bobbitt his mother.

"Fight-the-good-fight-of-faith White, Shoe-maker, Perseverance his wife, and their six children.

"Fly-debate Ridaway, Lock-smith, Gunsmith, and Clock-maker.

"Kill-sin Pimple and Mistress Pimple, Brewers.

"Meek Saltonstall and his familie, being 12 persons.

"Stand-fast-on-high Stringer, Chemist, Trafficker and Marchant, Dealer in cloth, gunpowder, and other eatables.

"God-reward Smart, Pedagogue.

"Faint-not Gumble and his familie, being 5 souls.

"Mistris Lucy Crabtree, Widow, and Experience Pickles, Spinster, maker and mender of men's cloathes.

"These all came out of England with Mr. Resolv'd Deepegrove. To whom joined themselves the following out of Plymouth, Duxburrow, Scittuate, Rehoboth, Swansey,

and other towns out of the colonies of Plymouth and Massachusetts:

"Capitaine Abednego Scarlett, and Nanaquaket his wife, being an Indian woman, and Ensign Lumpkin, being both men of war expert against y^e wiles of y^e barbarous salvages.

"Antipas Palfrey, and Feare his daughter.

"Gershom Hatherle.

"Manasses and Ephraim Grigory, twin sons of Mr. Deliverance Grigory, of Yarmouth.

"Isaack Hailstone, and Too-good Hailstone his wife, out of Barnstable.

"Mr. Preserved Tinckham.

"Richard de la Forrest, a frenchman.

"And Thou-shalt-not-beare-falce-witness Trimmer (who also came out of England with Mr. Deepegrove), Towne Clarke, with Goody Trimmer his mother, dairy-woman and cheese-monger."

This was the first of the old papers. It was interesting in giving me the society of which the settlement was originally composed. The old burial-ground verified the conjecture that this was the Deepegrove spoken of in the record, by reproducing nearly all the names upon lichen-covered and sunken tombstones. My friend said that there was one fact which puzzled him. Sir Tristram Deepegrove, who flourished under the reign of Charles II., was stated to have married his cousin Lettice, and yet here was her name among the voluntary exiles. That she had returned to England or that he had sought her in this country was equally improbable; and yet the latter alternative was possible, for there was a tradition that Sir Tristram had sought refuge beyond seas—locality unnamed—during the Protectorate. My friend had seen her portrait in the picture-gallery of the castle—the meek face of a saint in the garb of a princess: too much pomp of this world for one who had been a simple Puritan lass. But then, perhaps Lady Lettice Deepegrove never was a little Puritan, I suggested. My friend, however, was sure of it; and the suggestion that a fugitive Cavalier had been successfully hidden here in a community of Roundheads fired my enthusiasm. It seemed to me to possess elements of interest even beyond those in the case of Goffe and Whalley. My friend said that he had looked through the town records, but the first volume, the very one in which some scrap bearing on the question might be met, was missing. Nothing disheartened, I went over the same ground. On an upper shelf, behind some old law-books, sermons, and worm-eaten MSS., I discovered a closely written volume, bound heavily in calf. It might have lain there for a century, for the dust of ages had settled on the unread folios that guarded its hiding-place. One glance as-

sured me. It was the long-sought volume—the records of the town for the first half century of its existence. I seized my prize eagerly, and, obtaining the proper permission, carried it home, where I might consult it at my leisure. It was indeed a treasure-trove. During the first years of the settlement there seemed to have been little of a legal nature to chronicle; but the “Town Clarke,” Witness Trimmer, was a man fully equal to the occasion, possessing, as he did, “an infinite resource of language, sometimes spreading little turfs of thought into prairies of expression, and capable of running through all the latitudes of diplomacy in so simple a mission as that of borrowing a peck of corn.” He had a supreme appreciation of the dignity of his office, and could not let a day pass without making an entry in the journal. The records were filled with side notes and remarks on whatever was going on, and furnished invaluable data for the historian. Side by side with such grave proceedings as the public whipping and expulsion from the colony as a Quaker of Gershon Hatherle, and the disfranchisement of the two Grigory boys for playing at cards, and “wantonly persisting in the same,” would be found other items supposed to have interest as indicating the progress of the colony—a statement at one time relative to the increase of Mistress Pimple’s pigs, and at another that Ensign Lumpkin had killed a wild beast, whether rabbit, or catamount, or one of the “lyons roaring exceedingly” (which, another early record states, peopled our forests), was not specified.

In this volume I came upon the first trace of which I was in search—a scrap from some London paper giving the news at which my friend the preceptor had already hinted, that Sir Tristram Deepegrove had fled, as it was supposed, beyond seas, thus evading the warrant of arrest as a malignant which was issued against him. The town-clerk could not let such an incident pass without comment.

Under this entry was the following item, remarkable only for its juxtaposition with the foregoing:

“This day our pastor, the very Revd. Resolv’d Deepegrove, is returned from a long and painfull journey to the Bay for supplies for the colonists. And shortlie after his entrance into the village, a strange, tall woman, in a red cloath cloke, the hood thereof drawn closely about her face, was met by Experience Pickles, spinster, at the edge of the towne. The daylight having declined, she could not plainly see her countenance; and she passing so swiftly, she did at first take her for a specter or a vision, and was much afrighted; but turning presently about, she saw her stand upon the steppes of the minister’s house, when suddenly there was a flash of great light, and the specter,

vision, or woman vanished away, as though the ground did open to receive her, or she had suddenly been drawn up into the air.”

Under two different dates subsequent to this, the “strange, tall woman” was mentioned again. Once as having been seen walking alone by the river-side, by Fight-the-good-fight-of-faith White’s children, who were watching cows in the meadow; and again by Goody Pococke, who was searching for herbs and simples; “and the said Goody Pococke, as well as the children, being strictly interrogated by me, testify that the said tall, strange woman wore the scarlett cloke abovesaid; that her face was dark, and her eyes and eyebrows exceedingly black; that when she saw them, she frowned in a fearful manner, and turning about, proceeded a little way down the river, and then presently vanished away. The children took her for an Indian squaw, who slipped away in a cannow hidden under the bank; but Goody Pococke hath it upon her mind that it was some manifestation of the Deuil, conjured up by the Blackamore gerle pertaining to Mr. Deepegrove, who is well known to be given to divers uncouth and heathenish practices; for the appearance, saith she, had its face black and mannish, and the phisicke which she made from the herbs gathered that day had not its accustomed virtue, being rather injuriouse and dangerous. All of which I have layed before Mr. Deepegrove as magistrate; but he maketh light of the whole matter, saying that Goody Pococke was doubtless in her cups, so that she gathered jimson weed for boneset, and that the children had most seemingly the right of it, for that not unfrequently Indians do adventure themselves so near the settlement as the river, and he will not that further inquisition be made.”

In this entry of Witness Trimmer’s I found the first reference to Voodoo Violet, and with it an explanation of the uncanny name of one of the prettiest paths in the village—one leading under the low cliffs along the river. It was so retired and beautiful that the worn-out appellation of Lovers’ Lane would have seemed most natural; but from time immemorial it had been known to the dwellers in Deepegrove as Witch Walk.

CHAPTER II.

“IN MY LADY’S CHAMBER.”

THE house in which I had taken up my abode for the summer was, so good Mrs. Hailstone informed me, one of great interest to antiquarians on account of a secret staircase which had lately been discovered, the family having resided in the house for many years with no suspicion of its existence. One day a tall but light piece of antique

furniture was moved from its place, and a narrow door was discovered with a staircase leading upward to a small space boarded off in the attic between the chimney and the sloping roof. There was not room to stand erect in it, but plenty for reclining, and there were evidences that a couch had been placed here. A lantern hung upon a nail, and on the floor beneath there was a stain, as though ink had been spilled, showing plainly that the occupant of this strange lair had passed away his time in writing. The room below from which the secret staircase led was the best in the house, and was known as "My Lady's Chamber"—why, even Mrs. Hailstone herself, who had a reason for almost every thing, could not tell; "for surely," she would say, "there never were any lords or ladies in this country." The room was ceiled with cedar, and the presence of hooks and rings seemed to imply that it had once been hung with tapestry. The toilet-table which guarded the hidden door was the only piece that remained of the original furnishing, but the mirror was of such size, the wood-work so exquisitely inlaid, and its entire design so pure and artistic, as to argue its European workmanship, though the casters which enabled it to be easily moved about were rudely fitted, and seemed to be of home manufacture. One of the first settlers had evidently brought it with him from his English home. As I glanced over the list of names, I saw but one that seemed in any way congruous with aristocratic belongings—that of Resolv'd Deepegrove; and an entry of Witness Trimmer's, which I came across somewhat later, gave proof that the toilet-table, and probably the house, had once belonged to him. The record stated that "Weep-not Billings, Blacksmith, having charged twice in the matter of a set of rowlers for a toilet for Mr. Deepegrove, was fined 10 shilling."

The discovery of the secret door, staircase, and closet under the roof so stirred up the family that a system of sounding of walls, sawing of panels, and taking up of floors was at once instituted to see what other secrets the old house could be made to divulge, the only important result being the finding of a trap-door in the floor of a dark closet opening out of My Lady's Chamber, which revealed a continuation of the staircase, a sort of steep ladder following the great chimney, by which one could easily drop into the cellar. Here there were evidences of an under-ground passage leading to a natural cave just under the cliffs, whose opening was passed by Witch Walk. The family were somewhat alarmed by these traces of accommodations for another set of occupants entirely independent and possibly beyond the cognizance of the recognized householders, and many were the conjectures raised as to what all this could mean.

I suspected that the lair had had a noble occupant, for whom, perhaps, it was originally planned and built, and I was sure now that the "strange tall woman" whose walks by the river-side had given that promenade its disreputable name was no other than the fugitive Cavalier, Sir Tristram Deepegrove.

The next link in my chain of romance lay between the leaves of the town records, in the guise of a small, thin book formed of sheets of pale blue paper folded down to *carte-de-visite* size and stitched clumsily together with coarse black thread. It was the private diary of Witness Trimmer, Towne Clarke. Its presence among the records was accounted for by an indorsement over the signature of the clerk of the General Court, stating that it had been used as evidence in the trial for witchcraft of Violet, servant of Mr. Resolv'd Deepegrove, of the town of Deepegrove, on the Connecticut.

The little book seemed to have originated in a lack of employment, and was a sad voucher for the statement that "Satan finds some mischief still for idle hands to do." Some physical defect appeared to have debarred Witness Trimmer from out-of-door occupations and sports; the keeping of the public journal filled but a small portion of his time, and the rest, he stated, he gave to the perusal of godly and sober books, mostly from the library of Mr. Deepegrove. These books related to the history of witchcraft as it had just manifested itself in England and Scotland, and his mind, shriveled and deformed, as his body probably was, reveled in the grotesque and the horrible. It feasted on the weird and terrible manifestations, to the truth of which the sanction and authority of the Church was given, until, little by little, it exchanged the real for the unreal world, and the conviction pressed itself upon him that he, Witness Trimmer, was bewitched. A hallucination almost as unfortunate, and perhaps the cause of this darker species of insanity, had preceded it. Lettice Deepegrove was the most beautiful and by far the most attractive girl in the colony, and Witness Trimmer, looking up from dissertations on the black-art, as he sat in her father's library, saw the fair enchantress flit before him, and was more truly bewitched than he afterward imagined himself to be. He was not the only one fascinated by the sorcery of her beauty; it had its effect on nearly every unwedded man in the settlement—a witchery of which her father could not have been entirely unconscious, for,

"Meek as she sits in meeting-time,
The godly minister
Notes well the spell that doth compel
The young men's eyes to her."

There is no evidence that he was displeased, though in all his congregation there was none whose attraction could cause a thrill of pride in the breast of Resolv'd Deepegrove.

THE STRANGE, TALL WOMAN IN WITCH WALK.

In the little diary, which the town-clerk evidently did not at first intend for other eyes than his own, Witness Trimmer confessed his love for Lettice. That her image floated before his eyes continually, and "in the breaches of the night had no thought but of her, so that I no longer suffer any exposition of sleep, but am constrained to rise and write pathological verses in her honor, with such elegance and wit withal of which I had not deemed myself capable." Some of these he seems to have been bold enough to send her, for he states further on that they were returned to him by the "Blackamore gerle with answers which, for so gentle a mayd as Lettice Deepegrove, did seem wondrous unpolite, and somewhat less than civil." From what followed it was easy to guess that the town-clerk persisted in his advances, that Violet was the medium through which all "discurridging" replies were conveyed, and that chiefly on this account the aversion which he had always felt for her on account of her African blood—an aversion shared even more universally by New Englanders of that day than by those of the present, on account of the smaller proportion in society of the negro element, a black face carrying with it something monstrous and frightful—gradually in his particular case deepened into such dislike and nervous dread that he could not abide her coming, it seeming to him to be the prelude to some fresh "greefe or mischief." "So that before she had delivered her errand, and oftines

before she was yet come in sight, I was ware of her approach by shiverings in my back, twitching of the legs, feebleness in the knees, loathing of the stomach, a sudden bigness of the hart so that I was like to choke, pallor of the countenance, megrims in the head, or such like disorders."

As he became conscious of the fact that he loved in vain, the sweet delirium gave place to a gloomy and more serious mental disorder. He began to see sights and hear sounds unseen and unheard by others, and for which he could give no explanation. Sometimes, as he read alone in the library, he heard phantom steps mounting and descending stairs where no stairs were, and once, to assure himself whence the sound came, he opened the door of the china closet, "whereupon there was a scrambling in the wall nigh unto the chimney, and presently the Blackamore gerle did appear at the door, and questioned if I had heard aught; to whom I answered, stoutly, Nay, having in mind that Scripture, 'Resist the devill, and he will flee from you,' and being determined not to give place to the adversary." Sometimes he would stand late at night staring up at the dimity curtains which softened the light that streamed, pure and holy as from a lamp of alabaster, through the windows of Lettice Deepegrove's chamber, and here, in spite of biting wind and driving snow, his blood would boil to his cheeks if her shadow traced its silhouette upon them. But here, too, the spell of the evil one was upon him, for twice he distinctly saw the shadow of a tall man, and that not of Mr. Deepegrove or of any one that he knew, cast upon the curtain; and once—horror of horrors—this fiendish shade threw its long spectral arm (probably exaggerated from the position of the light) around Lettice's shadowy form.

Such a state of mind could not exist for any time in such a man as Mr. Witness Trimmer without coming under the observation of others. Mr. Praisever Pococke, Phisition and Chirurgeon, finding the case beyond his medical skill, did not hesitate to tell him plainly that he was bewitched. At the same time the current of popular opinion seemed to set more decidedly against Violet; for in the town record, under dates corresponding to the last pages of the private diary, there were numerous complaints entered against her odd pranks, culminating at last in an account of a trial before the General Court for witchcraft.

The principal accusation against the unfortunate creature was that "Mr. Witness Trimmer, by her wicked arts, on the fift day of may, in the year abovesaid, and divers other days and times, as well before as after, was, and is, tortured, afflicted, pined, consumed, wasted, and tormented, for which the plaintife cometh to be damnified."

New England was not yet ripe for the witchcraft tragedy. Mr. Deepegrove himself defended the poor girl, bringing to the case ability of no mean order; and, not content with simply clearing her, on the close of the trial brought on a case of "defamation and slaunder against the above-mentioned Mr. Falce Witness Trimmer, in the matter of fourty pound," asserting that he had used "deceipt," and that he would presently prove him to be a "foresworn, lying knaue;" making good his assertion, too, as it would seem from the verdict, copied with great care in the town-clerk's own hand: "The Court haue ordered vpon the case, *imprimis*, that the plaintife is to have satisfaction to the amount named, for his, the defendant's, illegal, injurious, and unjust troubling and molesting of Lettice Deepegrove, gentlewoman, in the matter of the shadow upon her curtain; *item*, that the said Witness Trimmer shall acknowledge his fault publickly in what place soever the said Mr. Deepegrove shall determine, adding unto his confession the words, In all of which I, the said Falce Witness Trimmer, did sinfully and wickedly speake; and *item*, that the said defendant is to pay the charge of the present suite, which is 9 shilling sixpence, and 10 shilling for Waitstill Warner, yeoman, sometime of Toughende, his attendance att the this present Court as attorney for the prisoner, all of the said fines and fees to be payed in currant siluer money, or in calves and cheeses or butter from his mother's dairy, and that as soon as conveniently may be; and *item*, the prisoner, in further penalty for his falce oath, is sentenced to forfeit the title of a gentleman, being no more called *Mr.*, but simply Falce Witness Trimmer, giving up likewise all right and title to that part of his name heretofore going before the words Falce Witness. In testimony whereunto I have this day set the seal of the Generall Court."

Thus ended the first scene in the tragedy. I was now at a loss to account for the fact that the town-clerk had written out so minutely his heavy penalty. The page upon which this copy appeared was worn almost to obliteration; on reading farther in the record I became convinced that the man so disgraced consulted it at least daily, that his mind might be wrought up, whenever proper occasion should present, to a terrible revenge of his humiliation.

CHAPTER III.

"THE WONDER OF FYER."

THE first entry of any consequence in the Deepegrove town records, after the remarkable report of the trial of the clerk, was one of great political importance, being the an-

nouncement that on "the fift of June, 1661, Charles the Second, Kinge of England, Scotland, firance, and Ireland, &c., was Sollemnly Proclaimed Att Plymouth in New England."

The accession of King Charles could hardly have been received with pleasure by more than one family in Deepegrove, but Witness Trimmer, for a wonder, refrained from any comment upon it; he seemed more interested in the departure, which he recorded immediately beneath it, of Lettice Deepegrove for England: "Whereat I doe not greatly marvel, she being ever prodigious pragmatical" (that is, fond of sight-seeing), "in-somuch that I have oftimes wondered that she could abide so contentedly and happily under her father's roof, taking no part in the sports of the younger sort, but gravely and soberly supplying the place which her mother hath long since left vacant, well chusing another world to the hypocrisy and cruelties which, without doubt, she suffered in this. But I doe here record that I have no grudge, malice, or ill-will whatsoever toward Lettice Deepegrove. I do wish her all joye and pleasance in the goodlie land to which she has gone, praying ever that those joyes may not endanger her soule's salvation, and thanking Him who hath doubtless called her away from beholding the judgments which He will shortly visit upon other members of her familie."

The last part of this remarkable volume of records was devoted to notices of intention to marry, and certificates of the performance of the ceremony. Each of these occupied a separate page, the reason seeming to be that the clerk had not taken the trouble to copy the documents, but had simply stitched the original paper into the book, indorsing its authenticity over his own signature and the seal of the town. One of these notices of intention interested me by the number of indorsements upon its margin and back, under different dates and in various-colored inks. I did not at first notice the names of the contracting parties, for the instrument proper was in a pale brown ink; and, though entire, an attempt appeared to have been made at some time to destroy it by fire, for the entire surface was scorched and the edges burned. The first indorsement, under a date several years previous to the trial recorded in the last chapter, read as follows:

"This is to certify that, while blowing the conch shell to call the people unto the publick worship of God, I, Witness Trimmer, took knowledge of a parcel of boys and gerles upon the meeting-house steppes, endeavoring to spy into the cage of wire in the which it is our wont to post all warnings of intent to marrie; and having dispersed the assembly, I did, in accordance with my duty, open the aforesaid cage to

take from it the aboue-mencioned instrument. Whereupon, to my great bewilderment, I found naught but this present bit of blank paper, and was minded to cast it from me as the unseemly geste of some mad fellow; but Mr. Deepegrove, coming presently that way, warned me that in such act I might, with reason, be impeached for non-fulfilment of duty, I having solemnly sworne to faithfully place upon record each and every paper found in this box. I do therefore certify that this present hath been duly exhibited the required number of Lord's days before the eyes of the community at large, in the place, and after the manner (in the matter of intention to marrie), in the Statute made and provided." Signed, sealed, dated, etc.

A corresponding entry further on showed that among the certificates of marriage handed him by the Rev. Deepegrove a blank leaf had also been found. If the indorsement that accompanied the foregoing was peculiar, the one which I now read was startling. It bore a date some three years subsequent to the accession of Charles II.:

"And now cometh Mr. Resolv'd Deepegrove, and maketh inquisition in the matter of the record of the marriage of his daughter, which, saith he, hath been regularly entered in these records, and prayeth that a certified copy of the same be drawn up and sent to his daughter in England, to her aiding and abetting in the securing to her son of the estates of her husband, now lately deceased. And no such record appearing, the said Mr. Resolv'd Deepegrove counselled that the blank leaves of this record be layed upon the fyer, lest some naughty persons should be minded to inscribe their names or those of others thereupon, and so errors and mischiefs do creepe in. And Major Pyncheon having ordered the same to be done, it was done, and whether by conjuration with the diuill or by other means, there immediately appeared upon these blank leaves, writ by the fingers of the flame, the notice of intention and the certificate of marriage between Sir Tristram Deepegrove, Bart., of Deepegrove, England, and Lettice Deepegrove, gentlewoman, of Deepegrove Colony of Massachusetts, which they now beare, and which the Worshipful Major Pyncheon did snatch from the flames before they had other power over them."

The certificate represented the Rev. Resolv'd Deepegrove as having performed the ceremony, and bore a rude representation of a violet as witness. The papers were further indorsed as having been copied according to request, and the copies forwarded to Lady Lettice Deepegrove.

At last the secret was out, and the community at large, and Witness Trimmer in particular, could ill brook the disclosure that a Cavalier of the bluest blood, and

probably of the same type of character as the elegant, accomplished, and profligate Rochester, or even of the witty, adventurous, and unscrupulous Buckingham, had been secreted during the entire rule of the Protectorate in the house of their pastor; and, bitterest fact of all, and the one against which most of rancor and spite was launched, that this elegant profligate had wedded during the first days of his stay the pride of the settlement, who had all the time received the attentions of the youth of the colony "as though she had righte thereunto as a guileless and vertuous mayd, and were not legally and lawfully, that is, after the strict letter of the law, though spuriously, subtly, deceitfully, and grievously against the spirit of the same, contracted, married, and wedded."

The real culprits were beyond their reach, but the father and minister who had so gravely betrayed them was still in their power. Charles II. was restored; they could not therefore arrest their victim for harboring the political fugitive, and once again the charge of witchcraft was brought forward. Mr. Deepegrove, at the preliminary examination held in his own house, explained as clearly as he could that he had tampered with no arts of the adversary; that the expedient which had served him was a very simple one, and consisted only in the use of a sympathetic ink prepared by his negro girl; that this ink was chemically of such a nature that it would turn dark under the action of fire; but unless heat was applied, would remain invisible. He felt that this was not the real cause of their displeasure; but he had nothing to say in defense of his harboring the young man his nephew, who had thrown himself without invitation upon his mercy, as he knew that no excuse which he could offer would be received by them. It did not, however, seem possible to him at the time to deliver up his own blood to death; and that his acts, meaning the marriage and its concealment, subsequent to affording an asylum to the young Cavalier, were only such as any devoted father among them would perform for the child he loved. The case was referred for settlement to the General Court at Boston, and Mr. Deepegrove was conveyed to that city for a trial which was destined not to take place, as he was assisted before the time set for it in making his escape to England. Arrived at his destination, he sent Violet money, with directions to place herself under the care of a sea-captain who would be in Boston at a certain day, and would bring her to her friends. When the letter arrived in Deepegrove, Violet was no longer there, and it was accordingly placed in the hands of Witness Trimmer, and filed with the town papers. The bolt which had glanced aside from the head of the prominent man had fallen upon

that of the obscure and friendless negro girl, and Violet was in jail awaiting trial for the second time as a witch. That she had been cleared once of such an accusation would only count against her, now the public mind was in a more disordered and feverish state; only the match of circumstance was needed now to set into terrible explosion the wide-spread mines of superstition, of which Witness Trimmer's darkened mind was only a type. If Resolv'd Deepegrove could have foreseen the result, he would have cut off his right hand rather than have thrown suspicion upon Violet by assigning to her the manufacture of the mystical ink. I have, perhaps, already quoted too largely from the records, but I can not forbear making one more transcript—that of Violet's indictment:

<i>Province of Massachusetts Bay, in New England.</i>	}	In the — yeare of the Raigne of our Souaigne Lord Charles II. by the Grace of God of England Scotland France and Ireland King Defender of the Fayth etc.
---	---	---

The Jurors for our sovereign lord the King present, that one Violet, spinster, blackamore, and of New Spain, the Barbadoes, or some other heathen country, in the service of Mr. Resolv'd Deepegrove, sometime minister in Deepegrove in the county of Hampshire, wilfully, maliciously, and feloniously, a covenant with the Devil did make; and signed the Devil's book and received as wages a Gally pot of Devil's ink, consenting to serve and worship him, and promising to be his both body and soul, here and hereafter; by which diabolical covenant the said Violet is become a detestable witch, having certain detestable arts called witchcrafts and sorceries, wickedly and injuriously used, practised, and exercised at and within the said towne of Deepegrove aforesaid, in, upon, and against the towne records, causing certain blank leaves when layed upon the fyer suddenly to become written upon without visible cause, means, or agency. The abovesaid Resolv'd Deepegrove at examination had in the aforesaid towne having testified, acknowledged, and confessed that he used the said Devil's ink which the said Violet gave him, it being white, which is contrary to nature and confirmeth its authorship, the Devil so working that that which is wrong doth appear right, and that which is black white. And the said Resolv'd Deepegrove having fled, departed, and absconded these provinces. All this against the peace of our sovereign lord the King, his crown and dignity, and against the form of the statute in that case made and provided.

Endorsed EZEKIEL TOOTHAKER, Forman.

How many terrible crimes—selfish brutality, frivolous feigning, blight of burning passion, cold cruelty, heartless unfaith, deliberate foulness of sensuality, or blackness of revenge—are daily committed in the name of Love! It was a great love for a sweet and gentle girl that, compressed in a soul too small for so mighty a passion, had turned to revenge, and had driven Witness Trimmer relentlessly on until its work was accomplished, and Violet lay in a felon's cell awaiting a trial of whose verdict and sentence there was no doubt. And Witness Trimmer, as he jogged homeward to await the time appointed for the trial, confessed to himself that the revenge was sweet.

Instead of the satisfaction which he thought would come, there was a vague

feeling of unrest. A great mist of doubt enshrouded him; he was dogged by an uneasy conscience. He had wished that Violet should meet the just doom of her own evil deeds, not that she should be the victim of his private spite; and since the recent revelations had swept away all the weight of the mysterious circumstances in the past, he began to wonder if something might not explain even this "wonder of

be needed at the Bay, a foreign letter was placed in his hand. His heart gave a great throb, for he knew the angular hand of Lettice Deepgrove, modeled so carefully after his own long ago in the little school-room in England." How often he felt the flicker of the pulse in the little blue-veined wrist as he guided the unskillful fingers in the difficult curve of the D! He could not trust himself to break the coronet-impressed seal

"A SLIGHT NOISE AT THE WINDOW DISTURBED HIM."

fyer." He wished that the interval before Violet's trial was not so long, that she might be convicted and executed before any thing should occur to weaken his faith in her guilt, his condition of mind being just that in which he "would not play false, and yet would wrongly win." The struggle went on for several days. At length, as the time was drawing near when his testimony would

in the presence of any one, and he hurried away to the cool retirement of his mother's spring house. A little brook entered the room at one side, made its circuit in a channel prepared for it, cooling in its way a score of capacious milk pans, standing half in and half out of the water, and making its exit at a place somewhat lower in grade, but not far from its entrance. He sat down on

the elevated island centre, and read eagerly. A slight noise at the wooden-barred window disturbed him, and a shadow fell upon the letter. The green eyes of a gaunt, half-starved black cat looked hungrily through the grating at the milk below. "It had been Lettice Deepegrove's pet, but had left the deserted house, and was now as savage and fierce as a wild-cat. Remembering how, as a kitten, she would roll it into a soft round ball, and deposit it mischievously in one of her father's broad-flapped pockets, or even in his reverend hat, witnessing with childish merriment the good man's surprise on feeling the creature upon his carefully curled wig, Witness Trimmer rose to admit and feed it. The frightened animal, misunderstanding the action, gave a wild leap, and disappeared. The thought that the familiars of witches sometimes appeared under the guise of black cats crossed his mind, and he returned to his letter with a shudder.

"It irks me," Lettice Deepegrove said, "that my father should have returned without that poor child Violet, and I feare me much that she may become entangled in some mischief in the matter of the ink wherewith my certificate was writ. It being no uncommon thing that, when any one hath discovered one of the forces of nature or uses of science heretofore unknown to mankind, presently there is raised a great hue and cry of witchcraft, and that in matters the most simple and guileless of evil either in their nature or tendency. Therefore I have thought best to certify thee that the writing was not made with ink prepared by any subtlety of man's device or charm of spirit or demon, being traced in the purest and freshest of milk; and I do beg of thee to make trial of the same, that proof may be, if at any time need doe arise, of the innocency of such writing. And I doe pray thee, Witness Trimmer, by the good affection which thou didst formerly profess for me, if there be any honor, if there be any praise, that thou do befriend the friendless and defend the guiltless, even that poor gerle Violet."

There was more, but this was enough, and Witness Trimmer fell upon his face, moaning with the intensity of the struggle going on within him. All around him stood pans of whitest milk, tempting him to make trial whether this thing were so. He was on the point of making the experiment, when the vision of the witch-cat poisoning all that pure flood with her "evil-eye" deterred him, and thrusting the letter in his breast, he went out to another day of doubt and torture. At the close of twenty-four hours the strain was too intense to be longer borne, and trimming a fresh goose-quill, and providing himself with a sheet of his whitest paper, he sought the spring house again. Even then he prefaced the trial

with an hour of strong wrestling in prayer, during which a strange calm dawned upon his half-crazed brain, and the passage of Scripture, "No man speaking by the Spirit of God calleth Jesus accursed: and no man can say that Jesus is the Lord, but by the Holy Ghost," seemed called to his mind by divine inspiration. Violet had said to him, fearlessly, at their last meeting, "The God whom I serve is able to deliver me out of your hand;" and when he had asked, "Who is your God?" she had repeated the name of Christ. He would make a similar confession in writing, and if he found it traced plainly by the fingers of the flame, he felt that this double assertion had Bible warrant for the impossibility of its fiendish agency.

The victory over himself was won; his quill passed rapidly over paper which it left as traceless as the fields between the dairy and the parsonage had lain in winter mornings, white with the snow which had blurred the air as he hurried across them from his midnight scrutiny of Lettice Deepegrove's window. Then, with fingers which heeded not the heat, he held the paper before the flame in his wide-mouthed fire-place until, as though fresh from the impress of a brand, there smoked upon it the words, "Thanks be to God which giveth us the victory through our Lord Jesus Christ."

All this was written out painfully in the quaint language of the little diary. Violet was saved, it stated, "but so as by fyer, being plucked as a brand from the burning." Her experience of the ocean in a slave-ship deterred her from attempting another voyage, and she found a grave under the violets in the Deepegrove burying-ground. I have transcribed the story found in Witness Trimmer's records, thinking that, though the tale is old, human nature is the same from age to age, and its moral of tolerance in belief and of forgiveness of injuries may not be out of place at the present day—

"For out of the old fieldes, as men saithe,
Cometh al this newe come fro yere to yere;
And out of old bookes, in good faithe,
Cometh al this new science that men lere."

I found his grave yesterday; it bore the name which the General Court had condemned him to wear, False Witness Trimmer, and the epitaph, strangely appropriate, though not original:

"He tried
To live without her, lik'd it not, and dyed."

GOOD-MORROW.

WHEN thus the morning weeps,
I say, good cheer,
Blue sky is near;
But when the day his rainy mantle keeps,
And wraps about him till with eve he sleeps,
I say "good-night" to sorrow,
Soon comes "good-morrow."

PAN-FISH ANGLING.

NE must be able
to take several
weeks from his

business, and expend an amount of money not only greatly disproportionate to the sport, but quite beyond the means of many ardent anglers, before he can think of indulging in fishing for salmon, trout, pompano, or any other of the more famous game fish of America. But it has become quite "fashionable" to affect a knowledge of angling as practiced in taking these larger fishes, while the charming sport of angling for the "smaller fry," or pan fishes, has been ignored or pooh-poohed as child's-play.

It is a part of the sad experience of every man who has been in the habit of breaking away from business in the trouting or salmon-fishing season for a few weeks' sport with these fishes, that much of the recorded pleasure of such recreation is more the result of mere after-thought than of fulfilled anticipations of rare sport. Tired limbs, drenched clothes, sullen fish that would not rise, long tramps to uninhabited pools, vexations of a thousand shades, fill up a large part of the true history of the summer excursions of the amateur anglers to our many noted fishing regions. I have known not a few cases where an experienced sportsman has returned from a month's stay in one or another of those regions without having killed as many fish as himself could have eaten in the time. Of course each angler, under such circumstances, has many excuses to offer for his ill luck, not one of which tends to establish what he inwardly regards as indubitable, viz., that these excursions never pay, in any sense of the word. But it is not my purpose to decry angling for heavy fish, or to deny that right royal sport can be had with salmon on the Canada rivers, with blue-fish along the Atlantic coast, and with trout in the Northern brooks. On the contrary, I can bear testimony to the exciting and fascinating nature of a strong battle with a twenty or thirty pound fish of

any sort; and as for brook trout, when they are to be found, they are full of sport. What I do maintain is that the commoner and generally overlooked fishes of our little inland brooks, or "creeks," as our people call them, are capable of affording excellent pastime, without any of the inconvenience, and with very little of the toil and expense, attendant on trout, salmon, or coast fishing.

Take, for instance, a stream not over four or five yards wide, and of an average depth of three feet, with here and there still pools of double that depth of blue, pure, but opaque water, in which you find small bass (say, a pound and a half for the heaviest fish), shoals of goggle-eyed perch, sun-perch, yellow perch, shiners, and red chub. Here you may depend on a week or two of quiet sport at any time during the months of May, June, and July, if you but know how to get at your business. There are hundreds of such streams in the United States into which a genuine angler has never cast a hook, and that, too, in our most thickly settled regions, within an hour's travel of large cities. Find such a stream, and at almost every pool, in season and out of season, you will see a man or boy, mayhap a woman, fishing with the conventional rod, line, and angle-worm, snatching out the spot-tail minnows and an occasional sun-perch; but such people do not dream of "goggle-eyes" and bass, or, if they do, they impale a live minnow on a great big hook, and patiently await impossibilities, hoping against hope that a half-pound bass will attempt to swallow a six-inch fish. It is a very interesting surprise to these sylvan conservative fishermen when you appear among them armed with your fragile-looking bamboo rod, with its hundred-foot silk line and nickel-plated stop-reel, your flies, your spoons, your artificial grasshoppers and counterfeit worms—a surprise, I say, and an interesting one, to them, because they soon discover that their streams are really well stocked with fine game fish. I remember an old fellow who said he had been for forty years fishing in a little stream of Middle Indiana, who was utterly taken aback when he saw me lift sixteen fine goggle-eyes out of a pool in sight of his home. He had always caught a few with worms early in the spring, but they were invariably small. He had never seen as large ones as those I killed; but no one had ever before cast a spoon and fly in that water.

As the object of this paper is to present in compact form all the information necessary to any one desiring to fully enjoy the exquisite sport afforded by angling in our small fresh-water brooks, I will take up in the order of their game qualities some of the principal ones of our pan fish, and discuss their habits while pointing out the best methods of killing them.

The striped bass of our larger streams is a noble fish, often weighing ten or twelve pounds; but in the little brooks of the Middle and Southern States he rarely reaches two pounds. I may therefore place him at the head of the list as at once the largest, strongest, gamest, liveliest, and finest-flavored of all the pan fish. He is found from Florida to the Lakes in all our streams, varying somewhat in markings and outline, according to locality and the kind of water he inhabits, but every where the same fish of prey; bold, swift, and merciless, darting upon and swallowing craw-fish, spot-tail minnows, small frogs, and every other live thing his throat can compass. You can soon discover his whereabouts by seeing the little fish skip out of the water to evade him. Usually his position will be in the shadow of a large boulder or close by a tuft of water grass, under a lily pad, or among the roots of some aquatic shrubs such as fringe our smaller streams. From such a hiding-place he rushes almost with the

whirling right before him. Ten to one he will pounce upon it at once; but he may not like the color. If after a few trials he refuses, change the tuft for a gray and red one. If that does not tempt him, put on a grasshopper stuck with a red feather, and so on, changing till you please him. This is the test for the day, and may be for several days. If he takes a certain spoon tuft, it is pretty certain that every other bass found that day will do the same. He darts at the bait and takes it with a snap. You give him just the slightest quick jerk, and away he goes, making your reel sing, till you arrest him and begin to fight him. If he weighs as much as a pound, he will pull like a savage. You will think you have hung a twelve-pounder. To properly land him, especially where the stream is fringed with hazel, pawpaw, or button-wood thickets, is a matter requiring no little skill. You have first to tire him down, and then gently lead him to some point where you can draw him ashore, shorten line, and lift

him out. Small bass will sometimes rise to a fly made of cardinal-bird's feathers, silver-leaf, and the gold feathers of the meadow-lark: but a very small whirling spoon, tufted in the hollow with scarlet and brown, is the best for general use after the 1st of June.

The goggle-eyed perch (*Pomotis rhomboides*), a beautiful fish, rarely exceeding a pound in weight, is very common in all the inland streams of the Middle and Southern States, and bites readily to an artificial minnow, a spoon set with yellow and red feathers, and to a live minnow, but it will

"TO PROPERLY LAND HIM," ETC.

swiftness of an arrow upon his prey. But he is not always successful, and as his digestion is strong and his appetite boundless, he seems never to be satisfied. Now, having spied out his lair, you may get some sport if you are properly prepared. Reel off line enough to reach him, and deftly launch a silver spoon tufted with red and blue feathers so that your little cork bob will keep it

not rise to a fly, or at least it can not be relied upon to do so. It can generally be found in small schools under the falls of the country mill-dams, and in the deep holes of the smallest streams, especially if the bottom be stony and full of crevices where they can hide. One of the finest days of sport I ever enjoyed was passed fishing in a series of pools on a little brooklet in Indiana,

where, wading from boulder to boulder, I cast my spoon into the deep currents between the stones on the confines of the pools, and hooked goggle-eyes as fast as I could handle them. It seemed that every crevice and pit in the stream's bottom had its swarm of these voracious fish, and none that I caught fell two ounces short of three-quarters of a pound in weight, and only one or two out of the 118 I killed went over that. It is often the case that no reliance can be put on piscatorial information obtained from the dwellers on the banks of a good perch stream, for unless the fish will take angle-worms for bait—a thing they often utterly refuse to do—these people have no means of discovering the presence of goggle-eyes, and will invariably tell you that none are in the stream. It is safe to say that nine-tenths of the smaller brooklets from the Lake Michigan region to that of the Gulf of Mexico are well-stocked with the *Pomotis rhomboides* during the spring and early summer months, and a little practice and careful observation will give the angler sufficient knowledge of its habits to direct him in killing it. A light, narrow silver spoon tufted with the scarlet feathers of the cardinal-bird will generally attract the fish, but you may have to add some brown feathers, and sometimes he will refuse every thing but a small minnow of the shiner or spot-tail. The goggle-eye is a gamer fish, in proportion to his size, than the bass, but he is generally found in narrow rapids and in very small pools where there is less room for sport than in bass-fishing. Sometimes, however, a spirited fellow will give you all you can attend to for a few minutes, and not unfrequently the most skilled angler will lose his fish.

On a little stream called Walnut Creek, in Middle Indiana, whither I go in the season to shoot wood-ducks with the long-bow, a friend and I killed in three hours a string of over thirty goggle-eyes, in the rapids below the falls of a mill-dam, with no bait but small fragments of a silver-side fish.

The sun-perch (*Pomotis vulgaris*) is the most beautiful of all our pan fish. He is commonly called sunfish, but the name does not belong to him. Seen in clear water, he shines with a brilliancy indescribable, his sides and under line, of a red-orange, shading off to golden yellow, fairly flaming if the sunlight reaches him. His width is about three-fifths of his length, and his stiff spiked fins give him a stubborn appearance well in accord with his nature. In our brooklets his weight seldom exceeds half a pound. He will sometimes rise to a sober gray or silver-winged fly lightly skittered, but usually the bait must drop to within a foot of bottom before he will take it. In any case he prefers live bait, seeming to be attracted to it rather by scent than sight. In spring

this fish runs in considerable schools, and may be found in the deep still eddies. It spawns in May, June, or July, according to latitude, in a nest hollowed in the pebbly bottom of a stream, where, if the water is clear, you may see it swimming round and round, savagely attacking and driving away every other fish that approaches. The smaller sun-perch will readily take an angle-worm, but the larger ones refuse; wherefore your skilled angler, with his small minnow or silver fly, gets all the fine fish, to the infinite envy of the urchins who follow him and patiently drop their cotton lines and clumsy hooks close in beside his fly or minnow, hoping by some rare chance to hook a "big one." I recollect a lad who thus haunted me on a perch stream, and who for a few brief moments one day enjoyed all the anguish of having actually landed a three-quarter-pound sun-perch. I was fishing with a minnow's tail for bait, and the boy cast, as usual, right across my line. At this moment the fish above mentioned struck, and in handling him I got him tangled in the boy's line. Such a jerk as that ragged scamp gave, it seems to me, would have landed a medium-sized shark; and out came my fish, line and all, every thing flying back over my head, upon the ground to my rear. The boy's eyes dilated to nearly twice their normal size as he precipitated himself bodily upon the fish; but when I showed him that my hook and not his was in the perch's mouth, he collapsed wofully and sneaked off. I laughed loudly at him, and he troubled me no more.

The black or blue bream (*Ichthelis incisor*) is a pan fish, of about the size of the goggle-eye, which abounds in the small brooklets of North Georgia, Alabama, and Florida. I have never found it north of the Cumberland Mountains. Its habits are those of the red-bellied perch, and at times it takes the common earth-worm as fast as presented; indeed, it never can be relied upon to take any but live bait, and its taste is exceedingly capricious even when that is offered. I recollect once, while fishing in the Oothecalog Creek, in the hill country of Cherokee Georgia, I tried every bait—fly, spoon, etc.—that past experience and the vexing perversity of the bream could bring to mind, with no result, and had about come to the conclusion that the fish had all left the creek, when I came upon a negro boy who had killed, with a short cane pole and a home-made line, a string of nearly fifty large bream. This made me inquisitive in the extreme, and I lost no time in approaching this ebony-skinned young sportsman with questions of the most leading character.

"What kind o' bait I use, masser? W'y, de was' nes', to be suah," he replied to one interrogatory.

"And what is was' nes'?" I inquired.

With a smile that had contempt and pity

at its root, the boy drew from his ragged coat pocket a huge wasps' nest, which was full of the larvæ of the wasps.

"Dem's de bait," he added, with a nod.

After that I had no trouble taking plenty of bream. In the South the large red wasps

The horned or red chub—a small pan fish found in nearly all of our lesser streams—is a favorite of mine, though I seem to be all alone in my estimate of his game qualities. To be sure, he greedily takes the angle-worm, and is the legitimate prize of any urchin

"WHAT IS WAS' NES'?"

build on the vines of the blackberry, and one nest contains enough bait for a day's fishing. You have only to stick one of the larvæ on your hook and cast it into a bream pool. If a fish is there, he is yours.

The blue bream is a strong, active, long-winded fish when hooked, and if you undertake to force him at first, you are pretty sure to lose him. He should be managed adroitly after the style of playing a small bass, and landed by a quick, steady lift as soon as he is led ashore.

No one who is fond of angling should ever pass through the South, especially North Georgia, in the fishing season, without stopping off to spend a week on a bream brook. In North Georgia the fish arrive about the last week of March, and the season lasts till the middle of June. Not only is the sport excellent of itself, but the weather is nearly always as fine as that of our Northern Indian summer, and the scenery is of the wildest and charmingest kind.

The yellow perch (*Perca flavescens*) I have never caught in Northern waters, but in the Southern brooks it is abundant and easily caught. Its habits are those of the sun-perch. It is an excellent table fish.

who can afford a hook and line; but he will also rise to a fly with all the promptness and vigor of a brook trout, and when he weighs nearly half a pound, he will run beautifully, and give your slender rod some considerable strains before you land him.

Several others of our pan fishes might be mentioned, but I have made the list long enough to serve my purpose, which is to direct the attention of the lovers of angling to a source of sport almost entirely overlooked. Those gentlemen who can not afford the luxury of a yacht, a month's excursion to the salmon streams of Canada, or a trip to our Western lakes, will find better sport in the first brook they can reach than may be had in some of the best trout streams of the North, provided always that they have made themselves acquainted with the habits of our pan fish, and the best means of taking them.

As a general thing, you will find two or three kinds of pan fish in a stream, and when one kind proves sullen, another may be in its glory. Thus I have often tried a "creek" for bass in vain, when goggle-eyes bit as soon as I offered them a chance to. When both bass and goggle-eyes refuse, you

may try for sun-perch, or bream, or chub, or shiner, or yellow perch, or red-billed perch, or roach. Some one of them will be sure to be ready for you, no matter how the weather is.

This brooklet fishing has scarcely a trace in it of the toil, danger, privation, and exposure incident to angling in the celebrated regions of salmon, trout, blue-fish, and channel bass. Sportsmen, as a rule, however, seem to adopt the delusive theory that the further they go the better their chances for fine sport.

At the farm-houses near our brooks excellent board and lodging may be had, with a boy to guide you, for about six or seven dollars per week; or, if you prefer to tent out, you can get cream, butter, eggs, "salt-rising" bread, and bacon from the country folk, and need suffer no lack of all the ordinary luxuries of town life, and at the same time enjoy all that is in the least enjoyable of the free experiences of open-air existence and adventure by field and flood.

A friend and I once fitted up a small skiff, which drew only a few inches of water, and in it drifted down a little brook for many miles, trawling for bass and goggle-eyes, stopping here and there to spend a day at some promising pool or stony rapid. We had with us a small fly-tent and the necessary cooking utensils, and no pleasure party in a steam-yacht ever experienced a more charming trip. True, it cost some labor to drag the boat over the frequent shoals, but every new pool we discovered more than repaid us for the effort it had required to reach it. A little way up a small tributary to this stream, at the mouth of which we pitched our tent for a day, I caught my first red chub with a fly. The water of the stream (a mere "branch") was quite clear, and I happened to see a chub rise and strike a small dead dragon-fly which was floating on the surface of a little pool. Acting on this hint, I took from my book a gray fly, attach-

ed it to my line, and dropped it on the water. Almost instantly a chub struck it. For half an hour or more I had rare sport there, taking about four pounds of fish as game as any trout.

The table qualities of our pan fish can never be questioned. The goggle-eye, the sun-perch, the small bass, and the red chub are the finest frying fish in the world, and the blue bream surpasses even the bass when roasted and served with salad. The negro cooks of the South know how to fry pan fish to perfection, rolling them in coarse corn meal or cracked rice before putting them into the butter. They are brought to the table crisp and dry outside, but juicy and soft within. Sometimes they parboil the fish, bone them, then work them into rolls with mashed Irish potatoes, and fry them brown.

In concluding this paper I would respectfully beg of any angler who may think of trying a "bout" for pan fish not to do so with a view of angling at hap-hazard. The killing of goggle-eyes and sun-perch is an art worth some pains to acquire. No "slouch" can ever succeed in bringing one of these little fellows to land in good style, nor can a careless observer keep before him all the facts necessary to success in this delightful sport; but close attention to the habits of the fish and the varying conditions of weather and water, together with some intelligent experimenting with different kinds of flies and spoons, will soon give him all he requires to master the situation.

When once you have properly begun fishing for pan fish, you are sure to get enthusiastically fond of the sport. It will grow on you day by day, till every other piscatorial pastime is crowded out of your mind. The babble of perch brooks will follow you to your business and enliven the tedious dryness of office labor, and the singing of the wind in the leaves of the great plane-trees will stay in your ears for days and days after you have put by the rod for the season.

FRIEND BROOK.

THOU hastenest down between the hills to meet
me at the road,
The secret scarcely lisping of thy beautiful
abode
Among the pines and mosses of yonder shadowy
height,
Where thou dost sparkle into song, and fill the
woods with light.

The travellers crossing the rude bridge, dear
Brook, would never guess,
From thy staid movement through the fields,
thy mountain loveliness;
Thou wanderest among weeds and grain in
commonplace disguise,
Most happy to evade the glance of undiscerning
eyes.

But I have heard thee whispering, "Call me by
name, 'Friend Brook,'
For that I am to thee; come up to my remotest
nook,
And I will give thee freedom of the hospitable
hills,
And pour my freshness through thy life, from
clouds and springs and rills."

O happy soul! thy song is sweet upon the
mountain-side:
The trees bend over thee, in league to stay thy
downward tide;

The wild arbutus, flushed with haste, trails close to make appeal
For brief delay, and after her the wet-eyed violets steal.

But not the white wake-robin, nor the wood-stars on thy brink,
Nor any summer flower whose roots from thee refreshment drink,
Can need thee with my need, Friend Brook; and never any bird
Can trill such gratitude to thee as my heart chants unheard.

No; not the wood-thrush singing in the pine-trees' twilight shade,
As if one-half his melody the boughs' low murmur made—
A love-song eloquent with breaks of speechless tenderness,
A music heard through thy soft rush, too sweet to tell or guess;

For thou respondest humanly, almost, to human thought,
Soothing the silent pain wherewith a stranger meddled not,
Healing sick fancies from thy clear life's overflowing cup,
And winning flagging foot and heart forever up and up.

Friend Brook, I hold thee dearest yet for what I do not know
Of thy pure secret springs afar, the mystery of thy flow
Out of the mountain caverns, hid by tangled brier and fern:
A friend is most a friend of whom the best remains to learn.

New-born each moment, flashing light through worn, accustomed ways,
With gentle hinderance, gay surprise, sweet hurryings and delays—
Spirit that issueth forth from wells of life unguessed, unseen,
A revelation thou of all that holiest friendships mean.

I will not name the hills that meet to hold thee hand in hand,
The summits leaning toward thy voice, the mountain, lone and grand
That looks across to welcome thee into the open light:
Be hidden, O my Brook, from all save love's anointed sight!

Yet am I glad that every year, and all the summer long,
Some wayfarers will seek thy side, and listen to thy song,
And feel their hearts bound on with thine over the rocks of care:
With such as these, through shade and shine, thy friendship will I share.

And out of their abounding joy new loveliness and grace
Shall grow into the memory of thy green abiding-place.
Thou veilest thyself in sun-touched mists through which I may not look,
Yet blends my being with thy flow, in stir and rest, Friend Brook!

MAHOMET.¹

MECCA seems to be one of those places where men would least care to dwell. A narrow valley, shut in by tall and barren rocks, opens amidst an almost boundless desert. No green thing softens the fearful waste, and for three days' journey, until the traveller ascends to the lovely gardens of Tayif, he sees only a few stunted shrubs and a hot expanse of stony sands. The city, inclosed by its circle or wall of mountains, cut off from the cooling winds, without shade, forest trees, verdure, or even a flower, is often visited by such intolerable heat as is scarcely known even in the heart of the desert. No rain falls for months; the sun's rays reverberate through the narrow valley; a stifling atmosphere nearly destroys life; and the glare of the rocks, sands, and skies completes the torrid desolation.² When the rain comes at last it sometimes falls in such torrents as to convert the whole valley into the bed of a raging stream, and the Kaaba itself was once swept away in one of these fierce inundations. But in general a perpetual drought prevails in the sacred city, and the thirsty Arabs pant and sigh for a paradise teeming with groves and fountains, and those fair and animated landscapes which nature bestows so liberally on the Syrian and the Persian.

A few brackish but never-failing wells or springs made Mecca at an early period the resort of caravans passing from Yemen, on the Red Sea, to Petra and Damascus; and in the cleft between the rocks, Abraham, it was believed, rested from his vicarious sacrifice, and Hagar and Ishmael took refuge. It is the boast of the Arabs that they are the descendants of the Hebrew patriarch, and the worship of Abraham is in some obscure way connected with the black stone and the hallowed temple in the Meccan valley. All Arabia looked upon Mecca as a holy city centuries before Mahomet; throngs of pilgrims came from all parts of the peninsula to pace round the Kaaba or kiss the mysterious stone; and the germs of Mohammedanism must be looked for in that star and stone worship which seems to have blended with Judaism, and transformed the early Arabs into the grossest idolaters. When commerce had turned away from its ancient course, and the caravan had been supplanted by the fleets of Ormus and the Ind, the greatness of Mecca must have passed away altogether; and it might have sunk into a

solitary ruin as desolate as Petra or Palmyra had not superstition still hallowed its sandy vale with the legends of Abraham, Hagar, and Ishmael.¹ A haunt of the wild Arabs of the desert from whom Mahomet drew his origin, and whose impulsive virtues and vices he never ceased to share, the hot and arid scene was peopled by the fertile Oriental fancy with raging Jinn, who covered the mountain peaks with their legions, and angels of spotless purity, who often met and put to flight their spiritual foes. To the Arab the air was full of spiritual forms, and an omen lay hidden in every passing cloud.

In their hot and sandy cleft amidst the rocks, where even in winter the air is stifling, and where the fierce simoom sometimes strikes men dead on the streets, the Meccans atoned for the aridity of their landscape by the vigor of their fancies. They had poets who contended at the national festivals for the sacred laurel, whose language was chosen with the nicest care, and whose honors were coveted as a priceless possession. Some trace of a high intellectual nature seems mingled with the sensual manners of the impulsive natives. Their songs and legends were labored and splendid, and their language had been modulated by the study of ages. For their savage birth-place they retained a patriotic affection, and the exiles of Medina sang in plaintive verses of their lost home. The dark-skinned, agile, and ever-active race, often tall, well-formed, and graceful, clung like wild beasts or insects to their desert, where no other living thing seemed willing to dwell. Yet they were men with all the common virtues and passions of their race. They were busy and successful merchants trading in the fairs of Syria, and wandering to the lovely vales of Yemen; they made their profits from the throng of pilgrims who visited the holy places; they had their camels, slaves, and flocks of goats and sheep; a rigid aristocracy prevailed among them; their savage society was divided into nobles and plebeians; and the notion of human equality had never dawned upon their uncultured minds. Compared with the intellectual Hebrew or the polished Greek, the Arabs of Mecca were barbarians. Their festive meetings were interrupted by savage quarrels, and their arid streets were often stained with blood. Nor did it seem possible that the children of Ishmael were ever destined to perform an important part in the civilization of nations, that the songs of Arab poets and the genius of Arab philosophers should awaken mankind to a new progress, or a hundred millions of the human race turn with reverence and affection to the sandy vale where Abra-

¹ *Mohammed and Mohammedanism*. By R. Bosworth Smith, M.A. New York: Harper and Brothers. 1875. We have used the more familiar name Mahomet in preference to that of the authorities.

² Burckhardt, Burton. No Christian, said Carsten Niebuhr (1762), dares enter Mecca, c. 66; but at Medina he saw Mahomet's tomb, a plain structure. Sale, Koran, should be consulted, with Muir, Weil, Sprenger, Lane's Arabian Nights, and Gibbon.

¹ M. Amari's *Storia dei Musulmani di Sicilia* has traced the division of the Arab race and the fierce ancestry of Mahomet.

ham was believed to have founded the Kaaba on its green rocks, or Hagar wept in her desolation.

Twenty-five centuries had passed since the patriarch* had fallen asleep amidst his flocks and deserts, when Abd al Muttalib, a venerable Bedouin chief, was the wealthiest and most distinguished of the Meccans. Like Abraham, from whom he probably traced his long genealogy, he was rich in cattle and in slaves. He was now seventy years old, and as the chief of the Meccans, guarded the Kaaba and the sacred stone. Warrior as well as merchant and cattle-drover, Abd al Muttalib had just repelled or evaded the attack of the Christian Abyssinians upon the Meccan territory, and the "War of the Elephant," as it was called, from the single elephant that accompanied the invaders, had been concluded by a sudden pestilence which had swept away the Abyssinians with fearful torments. Mecca had escaped from its foes; and the generous old man was famous for his hospitality, his alms, his virtues and wisdom, no less than as the deliverer of his country. His youngest son, Abdallah, was the fairest of the Meccan youth, and his charms, his high birth and apparent wealth, had won the affections of many a noble maiden of the valley. But Abd al Muttalib took him away from them all, and married him to Amina, the loveliest of the daughters of the desert, and at the same time married himself Hâlah, Amina's cousin, who bore him a son, named Hamza. The two weddings seem to have happened in the year 570 or 571. The first at least was unfortunate; the beautiful Abdallah died soon after his marriage at Medina,¹ and Amina was left poor, dependent, and sorrowful, for her whole possessions consisted of five camels, a flock of goats, a slave girl, and a small house at Mecca.

Not long after Abdallah's death, Amina became a mother, and her only son was to be known to all succeeding ages as the Prophet and the Vicar of God. Tradition has covered his birth with miraculous legends; the heavens opened, and birds-of-paradise, gleaming with gems, sang around the humble cottage of Amina. But Mahomet himself seems never to have countenanced the extravagant fancies of his followers, and so little did Amina feel the divine mission of her son that she hastened to send him away to be nursed among the wild tribes of the desert.

It was the custom, it seems, among the women of Mecca, like those of Paris, to forget or neglect their natural duties, and the young Mahomet lived until he was five years old with his nurse Halîma and her husband. Halîma was a tender foster-

mother. Once only she brought the strange child back to Amina, when she believed that he had become possessed by Satan, for he had apparently epileptic fits from his cradle; and once the young Mahomet fixed his teeth so deeply in the shoulder of his foster-sister that the scar remained ever after. Halîma consented to take him back to her tribe, but still watched, with some awe, the nervous and strange child; and at last, terrified by what she supposed some new proof of the presence of an evil spirit, restored him in his sixth year to his mother.¹ He remained with Amina probably a year, when she died, and Mahomet was left an orphan, impoverished and alone, to the care of his grandfather, Abd al Muttalib. The venerable chief received with joy the son of his beloved Abdallah. He would carry the child to the Kaaba, and when any one strove to separate them, would say, "Let my little son alone," and stroke him on the back. But in 578 Abd al Muttalib too died,² and Mahomet was seen weeping bitterly as he followed him to the tomb. Misfortune and death had pursued him incessantly, a cloud had settled on his childhood; but a generous uncle—Abu Talib—now assumed the guardianship of the helpless boy, and treated him with unchanging kindness, nor do the Arabs seem ever to have been wanting in the elements of natural benevolence.

With his uncle Mahomet went on a mercantile journey to Syria, and saw the solemn ruins of Petra, the remains of fallen nations, the lonely waters of the Dead Sea, and perhaps the splendid ritual of the Christian churches, and the intellectual worship of the Jews. The sad and somewhat gloomy temperament of the boy would at least draw instruction from the spectacle of decay. His poverty was now extreme, according to tradition; his uncle's family were sometimes oppressed by actual famine, and Mahomet, in his distress, became a goat-herd, tending his flock in the tall hills around Mecca. Here, in utter solitude, covered by the mysterious company of the stars, he may have meditated on the miserable weakness of his race, and felt that he clung, like the leaves and the insects, to a world that must soon cast him off forever. He went, apparently with the Koreish, on a military expedition to the fair fields of Taggib, three days' journey from Mecca, among the mountains, and here heard, perhaps, a Christian bishop preach with zeal and sincerity a purer faith. He never learned to read and write, but he had listened to the songs of poets and the voice of native eloquence, had seen the most eminent men of his tribe, and lived among

¹ These legends are at least illustrative of Arab life, and are told by Wäckidi, Mahomet's best biographer. See Muir, i. p. 19, etc.

¹ Wäckidi relates the marvels. See Sprenger, i. 145, and note, p. 164-5.

² He was eighty-two years old, but Gibbon would have him one hundred and two.

the wisest of his contemporaries. An instinctive refinement had kept him from vice, and he was accustomed to record or to survey with pleasure his own pure and untainted youth. He was almost a coward, and shrank from pain, and from all the traits of human weakness and degradation. He was early known at Mecca as Al Amin, "The Faithful," a man of integrity and honor.

Lingering almost useless and forgotten in his uncle's house, Mahomet may have lamented the swift flight of time, and, in his three-and-twentieth year, anticipated the youthful complaint of Milton. The goat-herd and the poet probably pined with a not dissimilar passion. But when Mahomet was about twenty-five, his uncle, it is related, called him to his side, and said: "I am, as thou knowest, a man of little property, and the times are hard. Now here is Khadijah about to send a caravan to Syria. Offer thy services, and she will accept them." Four camels was the price demanded for Mahomet's hire. The liberal widow consented. The Prophet managed his business well. He travelled to Bostra and Damascus, and may have seen the gross degradation of the Syrian Christians, the universal spread of monkish idolatry, and caught at Gaza a distant view of huge ships sailing like mountains over the billows of the Mediterranean. He returned full of triumph to Mecca. Khadijah, sitting with her maids on the upper story of her house, saw him ride into the town, fair, young, and prosperous, at the head of her caravan, and soon heard from his eloquent lips the story of his toils, dangers, and success. Desdemona was not more fatally ensnared.¹ Khadijah was forty, rich, powerful, and well-born, fair and liberal; her Othello was only twenty-four or twenty-five. Yet millions and hundreds of millions of the dark-skinned races of the East have dwelt with exultation in all later ages on the passion of the generous widow for their Prophet, and acknowledged, with Mahomet, the surpassing virtue of Khadijah. "She helped me," he said, "when all men neglected me, and believed when all others doubted."

Mahomet had inherited the rare personal attractions of Abdallah and Amina. He was tall, graceful, and dignified, his countenance engaging, his eyes dark and lustrous; his thick black beard reached down upon his breast; intelligence and a pensive melancholy marked his carriage; he spoke seldom, yet always in language musical and refined; sometimes he broke into sallies of humor and loud peals of laughter; he was passionate but forgiving, gentle yet full of dignity. "Never did he speak to me an

unkind word," said one of his slaves of him. Yet his air was so commanding and austere as at times to awaken an indescribable awe. A vein in his forehead swelled in his moments of excitement, and his eyes, blood-shot and restless, seldom fixed upon any single object, but were full of the inspiration or the poetry of a prophet or a seer.

Khadijah, who had been sought in marriage by many noble Meccans, had rejected every offer, and lived in retirement, adding to her large fortune by a successful trade. Mahomet alone had won her heart. Yet we are told she hesitated how to make known her preference, and a sister or a servant opportunely lent her aid—went to the young man and said, "What is it, O Mahomet, that keeps thee from marrying?" "I have nothing," he replied, "in my hands wherewith to marry." "But what if some beautiful and wealthy lady should offer to place thee in affluence, wouldst thou have her?" "And who can that be?" said the astonished Mahomet. "It is Khadijah." "But how can I aspire to her?" "Let that be my care," said the confidante. "I am ready," he said. And the servant went to tell all to Khadijah. But one obstacle still seemed to threaten discomfiture to all their hopes; for Khadijah's father, a powerful and wealthy Meccan, was certain to refuse to bestow his daughter on her poor and obscure suitor, and a lover's stratagem was employed to deceive the unsuspecting old man. Hamza, Mahomet's uncle and friend, was bidden to the wedding. Khadijah prepared a feast for her father, and when he was overpowered by wine, cast over him the perfume of ambergris, and dressed him in a marriage garment. He woke only to discover that his daughter was married to the obscure Mahomet, and, full of rage, denounced the unequal match. Fierce words were spoken, weapons were drawn, but the quarrel ended in reconciliation. And thus Mahomet and Khadijah began their married life with a pious fraud. The legend is told, not without reluctance, by the Prophet's most accurate biographers.

Thus raised, Aladdin-like, to sudden affluence and distinction, Mahomet lived with his Khadijah in a fair house at Mecca, the site of which is still shown to the traveller. Faithful and devoted to his generous wife, they dwelt in happiness together, although that strange restlessness and peculiar temperament which had alarmed his Bedouin nurse in childhood seem never to have deserted him. His busy and poetic intellect grew cloudy and stormy in repose. Often he fled from his fine house and affluent ease to hide in a solitary cave on one of the hills above the city, to give himself to fasting and meditation, and wrestle with the evil

¹ Tradition and his biographers supply Mahomet with two angels to accompany him on his ride into Mecca. Sprenger, i. 185.

¹ The legend is told by the biographers. Sprenger, i. 194.

spirits that pursued his path. He kept the fast of the Rajab with austere severity. His wife, touched by his religious fervor, or careful of his safety, sometimes went with him to his cave. Yet often he was alone, and such wild visions and fearful anticipations came upon him that he was nearly driven to suicide. Two or three miles to the north of Mecca rise the bare rocks of Mount Hira, or the Mount of Light, and on its side the cave is shown—the most solemn spot in the story of Mohammedanism¹—where the Prophet wrestled with the mysteries of life and death, and where the angel at last descended to summon him to the conversion of mankind. It is indeed a scene well suited for an eremite and a recluse. All around is a spectacle of desolation: the bare and arid desert, the black and barren hills, the white sandy valleys without a trace of life or joy. His excitement grew with meditation and solitude, and he began to pour forth the intense thoughts that maddened him in poetical strains that are at times not without Miltonic energy.² In Sura CIII. he sings:

“By the declining day I swear!
Verily, man is in the way of ruin:
Excepting such as possess the Faith
And do the things that be right,
And stir up one another to truth and steadfastness.”

It was not unnatural that Mahomet, to whom all other sources of mental progress were closed, should turn to religious speculation. The atmosphere of Mecca, above all other places except Jerusalem, was filled with the memories of the prophets and the seers. It was a holy city and hallowed ground, and if its people were probably noted rather for their avarice than their piety, the ideal of a higher life still hovered over the home of Abraham. Yet its spiritual condition might well claim the unsparing hand of the reformer. Mecca had long fallen away from the pure creed of Abraham into gross idolatry. Three hundred and sixty idols of various shapes and unequal worth defiled the precincts of the Kaaba.³ The God of Abraham was forgotten by the worshipers of the temple he had founded; the idols Al Lât and Ossa engrossed their gifts and their sacrifices; men, women, children, had been immolated at their barbarous shrines; the city was steeped in cruelty and license; its wine shops and its

bazars teemed with profligacy; and the austere and rigid Mahomet had seen with fierce contempt and shame the decay of faith and virtue.

Puritanism is the necessary alternative of an aspiring intellect shocked by the spectacle of human degradation, touched by the sudden glimpse of immortality, and Mahomet went beyond even the bounds of puritanism, to an asceticism that could only have increased the pains of his mental torture. From his fortieth to his forty-third year his paroxysms of religious insanity increased. An eremite amidst the gloom of his silent cave, he shunned all the allurements of the senses. Often in his agony he meditated death, and resolved upon self-destruction. A tendency to suicide seems to have been inherent to his constitution;¹ an early acquaintance with bereavement and misfortune had covered him with an incessant melancholy. In his solitude the flames of a fiery hell seemed to threaten all mankind. The knowledge of the true God had departed, and Mahomet pursued with his uninformed yet acute intellect a rigorous search for truth. Of his sincerity at this period of his career there can be no doubt. Wealth, ease, and pleasure he had abandoned to give himself to the cause of benevolence and charity, to awaken mankind to a higher faith. “Woe,” he cried, “to the slanderer and defamer, to him that heapeth up riches! he shall be cast into the crushing Fire, for the Fire of God is kindled,”² etc. It was to the relief of the poor, the orphan, and the stranger that he had devoted himself, and his mind plainly tended to a religion whose foundation was universal charity. He had some acquaintance with the principles of Judaism and Christianity, but the idols of the Christians were as shocking to him as those of the Kaaba, and he turned rather to the pure monotheism of the Hebrew prophets than to the more complicated and degenerate faith of Syria. He was anxious only to revive the conception of the God of Abraham, to exchange the law of Moses for his own; and hence, as the learned Deutsch indicated, the religion of Mahomet was almost a continuation of the dissertations of the Talmudists. Yet it differs from them in quality if not in nature, for the composers of the Midrash were men of rare intellectual culture, studious, laborious, and refined. Mahomet was an illiterate Arab, chanting forth a system that was covered with fanatical obscurity and lost in clouds of contradiction.

In his moments of inspiration, his followers relate—and they gazed, no doubt, with intense attention upon his august form—

¹ Noldeke, *Gesch. des Korans*, p. 17. Whether Mahomet was in the actual presence of the Deity is still a question discussed by his followers. His own claims are not of immediate revelations.

² The Koran is written in irregular verse, usually rhyming, and broken by constant “refrains.” Noldeke, *Gesch. des Korans*, p. 27. Die Rede in kurze Glieder zerfällt, von denen immer zwei oder mehrere auf einander reimen, etc. It is divided into Suras, or stanzas.

³ Sale, *Prelim. Discourse*, describes the idols. One was a vulture, another a piece of dough.

² Sura XC.:

“And what shall cause thee to know what the Ascent is?
Freeing the captive, and giving food,” etc.

the Prophet was covered with anxiety, and his countenance was troubled; he fell to the ground like one intoxicated; on the coldest day his forehead was covered with great drops of perspiration. His inspired moments came upon him suddenly, nor did any one know when the divine communication might descend. In one of these paroxysms he was alone in his cave. A horror rested upon him; the solemn desert, the wild rocks, the speechless stars, were the only witnesses of his agony; when suddenly a light encompassed him, heaven opened, and a glorious form approached, clad in a majesty almost divine.¹ It was the angel Gabriel. In one word he embraced the genius of Mohammedanism. "Cry," said the stately vision, famed in the traditions of the Arabs as the heavenly messenger to the lonely thinker—"cry, for thou art the Prophet of God." Often from this time the gracious Gabriel, most beautiful of the angels, descended to communicate the will of God to the Prophet. He was now sure of his own divine mission. At first Mahomet had fancied that it was the Jinn or genii, so famed in the Arab legends, that had covered him with mournful anticipations and tempted him to self-destruction. The Jinn were a race of fallen spirits who hovered around the limits of paradise, and sometimes caught faint intimations of the purposes of the Almighty, which they communicated to their servants on earth, the soothsayers and magicians. But now the approach of Mahomet banished them forever from the sacred boundaries; and a flight of shooting-stars which happened at this time was believed by the faithful to be the fiery bolts shot by the angels at the flying but audacious Jinn. The appearance of Gabriel opened his new career to Mahomet, and he began at once to preach.

A new prophet at Mecca can not have aroused at first any intense interest, for the sacred city had ever been the favored scene of spiritual impulses and religious aspirations. Every idol had its faithful worshippers, and those who adored a vulture were naturally the enemies of those who knelt before an unhewn stone. The wiser Arabs seem to have often lamented the spiritual divisions of their country. But from his forty-fourth year, Mahomet, no longer hiding in his solitary cave, began to stand in the streets of Mecca and point his countrymen to the faith of Allah and his Prophet. His first convert, his faithful wife, had at once acknowledged his divine mission; the slave Zeid, the boy Ali, and one or two more made up the company of the faithful. The Prophet was still looked upon as a madman, and only the generous Abu Talib and the

sympathy of the Hashemites saved him from some rigorous persecution. Yet year after year he persisted in his solitary cry. The pilgrims to Mecca heard him as they came to pace swiftly around the sacred temple; the news of a new revelation spread through Arabia, and the people of Medina were prepared to follow the iconoclastic faith. The Hashemites, his cousins and relations, long fallen from their former greatness into poverty and neglect, one by one yielded to the eloquent declamation of Mahomet. Orator and poet, he was never without an audience. He preached to the slave and the noble, the aged and the young. His wild bursts of rhapsody and wisdom, of keen intelligence and utter frenzy, told of the paradise glowing with rich fields of pleasure, and an inferno hotter than the simoom of the desert—of immortality, purity, a single deity, and an overruling fate.¹ Such ideas, presented with the intense fervor of an undoubting faith by Mahomet and his disciples, could not fail to win the favor of the honest and the wise, and Abu Bekr, Hamza, Omar, Othman, were ranged on the Prophet's side. Some of the most eminent of the Meccans were found in the ranks of the companions of Mahomet.

Yet, as the Prophet may possibly have foreseen, the religious reformation soon assumed a political aspect, and the enemies of the Hashemites may have discovered in their secret assemblies the omens of revolution. The Koreish keepers of the Kaaba, the oligarchy of Mecca, might well have feared that with the fall of its idols the attractions of the sacred city would pass away, that the profits of the pilgrimages would cease with the new faith, or at least that the Hashemites, led by the illustrious Mahomet, would snatch from them by force the keys of the sacred places. A persecution began. The followers of Mahomet fled from the city to Medina, or to Abyssinia. Touching legends are told of the pains of the martyrs and the constancy of the humble converts. Some slaves were exposed to the hot sun of Mecca, clad in brazen armor, yet were not all won from the faith. A ban was laid on the Hashemites. The first Mahometans gathered together in a safe quarter of the city around Abu Talib's house, and were prepared to defend themselves with the temporal sword. For two, perhaps three, years the Hashemites lived in their retreat, impoverished and persecuted, venturing out only when the period of pilgrimage insured a general peace. They were cut off from all friendly intercourse. No one would sell them corn. The cries of their hungry children were heard by the people, and some

¹ The appearance of Gabriel is variously described by the biographers, yet all unite in the fact and the place.

¹ Barthélemy Saint-Hilaire, *Mahomet et le Koran*, calls the religion of Islam "la vraie et sainte doctrine que Mahomet est venu prêcher au monde arabe," but its errors plainly overbalance its truth. Pref., x.

gentle hearts gave them charity by stealth. The Prophet stood among them patient and immovable. At last they were released and the ban removed, but with intense and bitter grief Mahomet saw his wife Khadijah and his uncle Abu Talib die in the midst of their distresses. He was overborne by a fierce burst of passion. Accustomed to lean on the generous support of his two benefactors, he saw them pass from him with bitter tears.

To Khadijah, Sprenger traces much of what is pure in Islam, and many of the noblest impulses of the Koran; after her death, he thinks there was a plain decline in the moral tendencies of the Prophet.¹ For twenty-five years she had watched over her impulsive husband with parental care, his Egeria and benefactress. Nor had Mahomet ever failed to win her perfect trust. Without her love and faith, we may fancy, with the biographer, he would never have become the Prophet of Islam, and in her death mankind received a serious wound. Four daughters and two sons² were born to them, of whom one alone, the famous Fatima, survived, to become the wife of Ali and the parent of an illustrious and ill-fated line. The death of Khadijah left Mahomet once more impoverished and helpless. He found little faith in Mecca. He wandered away with Zeid to preach in the fair gardens of Tayif, but the people drove him away with stones. He came back timid, discouraged, and, afraid to enter the city, hid once more in the cave on the Mountain of Light. Yet such is the inconstancy even of heroic affection that we find the Prophet, two months after his wife's death, married again to Sawda, another widow; and at the same time he seems to have been betrothed or married to the young daughter of Abu Bekr, Ayesha, whose jealous hatred of Fatima and her descendants was to convulse the East with an endless schism. Ayesha was only six or seven years old, her husband fifty, and the disparity does not seem to have been noticed by the devout Abu Bekr. But Mahomet now heard, what was of signal importance to him, that the people of Medina had become converts to the new faith, or were at least willing to receive with favor his devoted disciples. He now planned a complete secession from Mecca to the friendly city, and, one by one or in parties of considerable size, the Mahometans made their way by night, in disguise or in various methods of concealment, from the hands of their persecutors to the walls of Medina. Here they were received with generous hospitality by its people. Even the Jews met them with favors. Ma-

homet, Abu Bekr, and Ali, with their families, alone remained at Mecca, and the Prophet waited for a divine command before he should commence the memorable journey. Secretly, however, the three Mahometans had made preparations for their flight. Abu Bekr had purchased two swift camels; a guide was hired. The long path from Mecca to Medina led through blazing sands and stony deserts, a distance of two hundred and seventy miles, and they must fly by unknown ways, hidden from their enemies. It was time for them to go. The Koreish had learned to fear the Prophet as a rebel and a reformer. One night the chiefs, or the assassins, came to his house, but found only Ali, who slept in the Prophet's bed. Mahomet, alarmed, had gone to the home of Abu Bekr. They descended together to the street, in the shade of evening, from a back window, passed through the suburbs of the city, climbed a lofty mountain, and crept into a cave. They were pursued. The enemy came to the mouth of the cave; but a pigeon laid its eggs at the entrance, a spider wove its web across the rock, and the Meccans, deceived, passed on. "We are but two," said the trembling Abu Bekr, "and shall be discovered." "There is a third," said the Prophet, "for God is with us."

In June, the 20th, 622, two swift camels came stealthily to the foot of Mount Thaur, climbed its barren side, and bore away the two Mahometans toward Medina. The Hegira is one of those epochs in the history of the world that are of more importance than the shock of armies and the fate of battles, and invention, discovery, science, art, hung trembling in the balance as the swift camels bore the fugitives away from their pursuers. Yet as a pure and peaceful religion the doctrine of Mahomet was to exist no more. The Hegira changed the Prophet into a political chief, bent upon endless war with the idolaters of Mecca, preaching the efficacy of the temporal sword instead of universal charity, hanging like a blazing flame of destruction over the nations, the omen of bloodshed, desolation, despair. In the Middle Ages it was usual to look upon Mahomet as a frightful demon and the spirit of destruction. Nor was the conception unjust. The lapse of centuries had not diminished to our ancestors the terror with which they learned that a new prophet had arisen in Arabia; that his symbol was the crescent and the sword; that the hordes of the desert had spread like locusts over the fairest regions of Christendom; and that the Arabian impostor or his followers ruled over Jerusalem, and menaced Constantinople and Rome.

As the two Arabs ride stealthily along the sea-coast from Mecca to Medina, unconscious that the fate of ages and of inventive progress hangs upon their safety, we may survey

¹ Sprenger, i. 355. Ohne die Liebe und den Glauben der Chadija wäre Mohammed nie zum Propheten geworden, etc. Khadijah has always formed a happy model of virtue to the Mahometans.

² Gibbon incautiously enlarges the number to eight.

briefly the condition of that world around him with whose character and people the Prophet was wholly unfamiliar. In the year 622 Arabia was still, as ever, unconquered, and a fierce spirit of independence had always marked the wild tenants of the desert. Yet that the Bedouins should ever break from their native peninsula to overrun and subdue the fairest portions of Europe, Asia, and Africa, was a supposition that could never have been entertained. They had never before, as they have never since, ventured beyond their native sands. The destroying genius of Mahomet was to unite them for a moment into one animated and harmonious body, the conquerors and colonists of a decaying world; and the historical inference seems to follow that we can form no complete conception of the powers of any separate race when touched by the rage of fanaticism and inspired by a poet's fancy. Barbarous, uncultivated, almost unarmed, save with the spiritual fire of the Koran, the Arabs met armies clad in steel, aided by all the appliances of high civilization, led by practiced commanders with undaunted skill and courage, and routed them from the Caspian to the Atlantic. Nothing could resist their novel tactics, their mounted squadrons, their flashing ciméters, and terrible cries. For nearly two centuries from the Hegira the wild children of the desert continued their mad race over the world, plundering, converting, enslaving, destroying. Nor was there any power within the limits of civilization that could manacle and restrain the hordes of Arab robbers.

Could Mahomet have looked from the shores of the Arabian Gulf upon the condition of his contemporaries in 622, he would have seen a world broken into hopeless disorder and nations perishing in a general barbarism. In England a horde of Saxon savages were destroying the remains of Roman order and the pure germs of Northern Christianity, and the papal missionaries in Kent had just begun to spread the later superstitions of Rome over the ruling race. France and Spain were passing through a not dissimilar process, conquered at once by the Northern barbarians and the idols of the South. The Germans were still rude or savage, their fair land covered by forests, the birth-place of new empires. There was a feeble and wicked emperor ruling at Constantinople, for the real virtues and heroism of Heraclius seem to have passed away with his youth; and he who had overthrown the might of Chosroes by a series of wonderful exploits did nothing to check the advance of the Arab legions. Timidity or indolence ruled in the councils of the East. Italy still obeyed Heraclius, and its popes, unworthy successors even of Gregory the Great, sat amidst the ruins of Rome, spectacles of moral decay. Rome was almost a deserted city.

In Athens a thin horde of robbers occupied the home of Pericles, and looked upon the unshattered portico of the Parthenon. Persia was fallen into decline; the Greeks still held Jerusalem, Alexandria, Cyrene, Carthage; but the central power of a great government had fallen with the genius of Rome, and it was not the least valuable part of the political labor of the Saracens that they constructed a new fabric from the shattered waste of nations, and gave a stable government to a large part of mankind. The Saracenic Empire almost rivaled that of Rome; but it fell, as all despotisms must fall, by the swift decay of the people. It rose and disappeared like some graceful vision along the path of mediæval history. Yet it gave to European barbarians an example of government where life and property were respected, where manners were often gentle, and conversation sometimes refined.

Still more memorable was the influence of the Arabian reformer upon the religions of modern Europe, and Christianity owes something of its recent progress to the flight from Mecca. For the opening of the seventh century was a period of intense idolatry.¹ All over Europe the worship of images had grown up amidst the general ignorance. From the pure adoration of a single deity inculcated by Paul and John, men had sunk back into the deepest superstition. The Christian churches, like the Kaaba, were filled with idols, relics, the coarsest impostures, the rudest gods. A nail, a single hair, a napkin, a piece of wood, were worshiped as reverently as Al Lât or Ossa, and Rome and Constantinople were provided with as many deities as Mecca. To the tendency of the intellect of his time Mahomet was to administer a swift remedy, and wherever his institutions ruled, idols were cast down, and the children of Abraham admitted only a single deity, beneficent and wise. The Allah of the Prophet would have neither images nor representations. The sword of the Saracens purged Jerusalem from idolatry, and founded a new school of religious thought in Europe. Leo, in the next century, began at Constantinople the war upon images; Charlemagne inspired Germany with a terror of idolatry; the Saracens and the Jews scoffed at the relics and glittering shrines of Christendom; the reformers of the North caught up the Arabian impulse; the Greek Church confined itself at length to the worship of pictures, and the Roman Church alone held fast to its throng of images or idols, and enforced their claims by a merciless persecution. Wherever the papal arms extended, the churches

¹ From the culture of the Jews, the most civilized people of the time, Mahomet gathered his leading ideas. See Deutsch, *Islam*, p. 329. But the Jews had never been able to spread their ideas to the gentiles, nor desired it.

were filled with their grotesque and fanciful representations of spiritual forms; wherever the Saracen came, he dashed in pieces the glittering idols; and in every mosque the presence of the God of Abraham was recognized by the spiritual eye alone.¹ To teach such a lesson was not without its happy influence upon the revival of a purer Christianity. Cruelty, terror, a severe intolerance, were to mark the religious progress of Mohammedanism; yet in one instance at least it eradicated a vice which not all the lessons of modern reformers have been able to encounter with success. A Dow or a Mathew might envy the thoroughness with which the Arabs closed every wine shop from the Caspian to the Atlantic, and made perfect abstinence the practice of the most civilized part of mankind. No temperance reform was ever so effective as that of Mahomet. But Mahomet inculcated his principles with the cimeter, and the heretic who touched wine might forfeit the joys of paradise, and be subjected to temporal punishment. It was a bold rebuke to the savage license of the Northern barbarians, whose feasts were drunken revelries, and whose rude banquets usually ended in strife and disorder. The morals and the manners of the Arabs were at least preferable to those of the savage Saxons and Normans.

But the chief achievements of the Arab teacher were to be in the aery realms of letters, and in that world of pure science from which a Newton and a Galileo were to gain an insight into the mightiest principles of nature, from which a chemical transformation was to carry thought from land to land and create the novel powers of mechanics. And the wild chant of the Koran may be said to be the most practical of poems, since it gave to men chemistry and mathematics.² Every Moslem was taught to labor by the descendants of the mercantile Arabians; a free school was planted by every mosque; and for four centuries the keen and subtle intellect of an industrious and inquisitive race was directed to the pursuit of science. It is scarcely necessary to recall their colleges, libraries, and schools that sprang up under the care of the literary yet semi-barbarous tyrants of Bagdad and Cordova; but the results of this period of study are so memorable as to deserve to be ranked among the most valuable of human labors. The Moslems gave themselves with such ardor

to the examination of the laws of nature as to invent the science of chemistry; they enlarged or revived algebra; they restored medicine to a scientific rank; and so infinite and so wonderful were their various inventions and discoveries that by their contemporaries in France and England they were uniformly looked upon as magicians and sorcerers. No one but Satan, William of Malmesbury and his monkish authorities tell us, could produce the strange machines, the curious books, and the fearful powers of the Arabs. The finest intellects of early Europe naturally turned to the Mahometan schools for instruction in elementary science; and Albertus Magnus and Pope Sylvester II. learned from Spain the principles of arithmetic, geometry, mechanics, and chemistry with which they astonished and awakened the barbarians of the North. Pope Sylvester, as the scholar Gerbert, had gained from the Arabs not only the secrets of science, but the art of teaching. His school at Rheims was attended by the son of Hugh Capet and the heir of the German Empire. The genius of Mahomet enlightened the two royal lines of Germany and France; Europe borrowed its science from Cordova and its literature from the amorous strains of Moslem poetry; and the mental supremacy of the Arabs of the tenth and eleventh centuries may be traced in the superstitious awe with which the priests and monks looked upon their own greatest scholars who had studied in the Arab schools. It was in the city of Seville, the centre of magic and incantations, the chronicler¹ relates, that Gerbert learned to surpass Ptolemy in the use of the astrolabe, Alcandræus in astronomy, or Firmicius in astrology, that he acquired the art of calling spirits from the infernal world, or became admirable in arithmetic, astronomy, geometry, and music. These arts, we are told, he revived in France or Gaul, where they had become wholly obsolete. Otho of Germany and Robert of France were his disciples. But all this mental supremacy Gerbert had won by a compact with Satan, and from the wicked practices of the Saracens. By his Arab familiars he was able to discover hidden treasures and cover himself with fabulous wealth; and once, when he was Pope, he clove the earth at Rome, and descended into a magnificent palace below, filled with gems and gold.² Yet the guilty Pope was at last borne away by his familiar spirits, and his soul perishes in eternal tortures. It was thus that Arabic scholars of the eleventh and twelfth centuries appeared to the barbarous Europeans. But they held in their hands the keys of modern progress, and are the real ancestors

¹ His conception of the unity of God he borrowed, no doubt, from the Jews. See Geiger, Mohammed und Judenthume, p. 97-131. Mahomet borrows and varies the Hebrew traditions, p. 152. See, too, Deutsch, Islam.

* Sprenger, Vorrede, ii. Man lese die Werke des Albertus Magnus, besonders aber seinen Libellus, und man wird sich überzeugen, dass der grosse Lehrer des Mittelalters fast all sein Wissen von den Moslimen entlehnt habe. Gerbert is an equally instructive example.

¹ William of Malmesbury.

² Will. Mames. (A.D. 1002) tells the story of Pope Sylvester with all the malevolence of his order against science. He wrote about 1140.

of the Newtons and Galileos, the Fultons and Morses, of the era of invention. Without a Hegira, chemistry must have slumbered for ages, and the telegraph and the steam-engine, the printing-press and the free school, might have remained hidden among the secrets of nature until the twentieth century.

Unconscious of the future, trembling for his life, the Prophet, with Abu Bekr his "sole companion," rode swiftly along the sandy track until he reached the sea. An Arab woman sitting at the door of her tent gave them milk. A single scout of the enemy met them and fled. Medina at last appeared over the desert; the Hegira ended, and the weary travellers found repose. But from this moment Mahomet was no longer the simple seer or prophet crying in the wilderness; new revelations had come to him; and at Medina he unsheathed the sword of vengeance against a guilty world. "The Koran or death!" was to be the war-cry of the nomad race as it clove, like a cimeter of Damascus, the perishing form of classic civilization. At Medina, Mahomet assumed the power of a temporal prince; his prolific tongue poured forth a new series of poetic ravings; the Koran grew by a ceaseless tide of contradictory revelations, and was swelled to gratify the momentary impulses, fears, or wishes of its author. Never, indeed, was there so strange a mass of vanity, of folly, confusion, and plain common-sense. Once Mahomet had yielded to terror or conviction, and worshiped the idols of Mecca; the next moment he repents, and covers them with denunciation. For every new marriage a fresh revelation was required; when his followers murmured, they were astounded by some unexpected reproof from the angels. In his stronghold at Medina, Mahomet became a robber chief, plundering the unbelieving tribes, and enriching the faithful with their spoil. He chanted, like Tyrtæus, to no inattentive audience. The fairest regions of Arabia gave up their camels, sheep, and goats, their slaves and gold, to the successful Prophet, and the Koran rang with the shouts of triumph. At length the aristocracy of Mecca, against whom Mahomet had gradually arrayed the chief tribes of Arabia, began to feel that no hope remained to them but in open war. The rebel and reformer, the son of the abject Hashemites, and the founder of an Arab democracy, was fast gaining a strength that even the courage of the fierce Koreish could not resist. A war raged between Mecca and Medina. The two Arab capitals were the centres, one of conservative idolatry, and one of a puritanical reform. One proclaimed the miraculous virtues of Al Lât and Ossa; the other celebrated the one unchanging God. The war raged with various vicissitudes. At last, at the head of an army of ten thousand men,

full of fierce ardor, cruel, mad, impulsive, the Prophet began his final return to the city he seems to have loved with untiring devotion. Medina he had named in gratitude "the City of the Prophet;" but to Mecca he turned as the holy shrine of the Arab faith. His forces were irresistible: the Koreish submitted to the religion and the temporal rule of the exile. Except for some fierce bursts of native cruelty, Mahomet treated his fellow-townsmen with lenity; but every idol was banished with ignominy from the Kaaba, and only the mysterious black stone and some venerable rites remained to indicate the star and stone worship which had once blended with the faith of Abraham.

The Prophet and Vicegerent of God, infallible, wielding, like a Boniface or an Innocent, the temporal and the spiritual sword, Mahomet, in the year 630, was already the most potent and famous of the princes of the East. From his native valley he sent out his ambassadors to the neighboring nations, commanding them to submit to the law of the Koran and obey the Prophet of the Lord. They passed unharmed to Persia, Abyssinia, Syria, and startled the Emperor Heraclius with the tidings of a revolution that was to fall with heavy disasters upon his feeble descendants; and a tradition related that the famous Emperor of Rome was not unwilling to accept the tidings of a new revelation and a Meccan oracle. But the last years of Mahomet were passed in constant warfare, and it was by the temporal arm that his faith was propagated and his power assured. He was a conqueror rather than a priest; his missionaries, bands of nomad robbers; his creed, a fierce inculcation of selfish greed. Sometimes he led his military expeditions in person, but his timidity and his want of skill were often rewarded with serious disasters. He subdued the rich fields of Tayif, and made it pay a heavy tribute to the Meccan rulers; he invaded the confines of the Greek Empire, but retreated somewhat ingloriously before the Christian armies. Yet his followers had long learned to trust with unflinching confidence to the venerable seer whose name was already illustrious in all Oriental lands, and who had made Arabia the centre of a power that was evidently destined to rule over the early home of the human race. Countless pilgrims began to throng to the holy city, and its avaricious people must have rejoiced in a rich plunder of the incautious strangers. Its name was repeated from land to land. The Meccans were enriched by the tributes of the conquered territory. Trade, wealth, activity, must have marked the city in the last years of the reign of Mahomet. Vast projects of universal conquest filled the minds of its rulers. The savage Koreish, now the firm adherents of the Prophet, were eager to spread

the faith and reap its rewards through the fair and languid cities of Syria, and all the world seemed to offer an easy prey to the Moslem. Like the cave of Ali Baba, the cleft in the rock was filled with the spoils of nations, and all Mecca gleamed with the treasures of art or industry stolen from the palaces and cities of the infidels.

In the midst of his obedient and grateful capital, or at Mecca, under the hills where he had tended goats to win a scanty living, Mahomet ruled with barbaric equity, and still retained some traces of puritan austerity. Of all the wealth of gold and gems, fine stones and cloths of gold, brought in by his successful marauders, he took nothing. He divided the plunder among his followers, or devoted it to sacred purposes. He lived in extreme and almost abject poverty. His house was a poor cottage covered by leaves; but around it were the eleven homes, equally plain, of his various wives. His food was chiefly dates and water. So liberal was he to the poor that his own family were sometimes in want and his children hungry, and, with the riches of the East under his control, the patient enthusiast preferred to live in constant need. His dress was plain, his carriage modest. Though more potent than Heraclius or the kings of Abyssinia, he would have neither throne nor diadem. At sixty he showed few traces of old age. A few white hairs marked his ample beard, and a faithful follower had wept when he first discovered them. Yet the Prophet to all Arabia seemed the fairest of human beings—more beautiful than the noonday, more gracious than a heavenly messenger; and it has been the curious labor of all later ages to penetrate that singular intellect, to read its designs, and discover with what sentiment, whether of pity, contempt, or zeal, whether as an impostor, or enthusiast, or a madman, Mahomet surveyed the devoted and ever-increasing throng of his adherents, as tribe after tribe and nation after nation took up the cry, "Allah and his Prophet." The author of the revolution has proved to all students of history an insoluble mystery. Of this question we need attempt no decision. It is sufficient to know that Mahomet was a man, that he shared in all human errors and rose to no divine height, that he was governed by human passions, and through human passions won his control of the impulsive races of the East.

Yet it is rather as an author¹ than a hero that Mahomet lives with posterity; and at Mecca and Medina, in the midst of ceaseless cares and toils, he found leisure to compose a poem and a book that was to take its place by the side of the Iliad and the Vedas. Nor

had he, like Milton or Homer, to wait for a posthumous fame. His vanity—the natural vanity of an author—was never weary of lavishing praises upon his own production. He pointed to the Koran as the proof of his divine mission; he challenged his foes to write something as musical, as graceful, and sublime. Nor was his challenge accepted. To his followers and to all Mahometans the Koran has seemed so divinely eloquent as to be the voice of God himself. Its Arabic is of such unrivaled purity as to be suited only to heavenly tongues. Its verse is the perfection of harmony, its sentiments the noblest that enter the human breast. As the Greeks¹ drew all their law, morality, and religion from Homer, so every Arab is content to lay the foundations of society upon the precepts of the Koran. Already while Mahomet lived he had the satisfaction to hear his verses repeated by his countrymen with rapture. Since his death their fame has steadily increased. Even infidels unite in admitting that the graceful Arab was a poet if not a seer, that he said many wise and useful words, and that the Koran is the work of an active and eager intellect struggling in the midst of barbarism to attain some traits of humanity, and in the midst of mental darkness aiding the hand of progress.²

At Medina, in his sixty-third year, Mahomet died, stricken with fever, in the arms of his beloved Ayesha. His followers looked upon his death as something frightful and incredible. They refused to believe that he could be bound by the common law of nature. With rage and despair they followed him to the tomb. Yet it is plain that Mahomet died not too soon; that, like Solomon, his wisdom had not been progressive nor philosophic; and that the jealousy of Fatima, his daughter, and Ayesha, his wife, could have left him little peace in his humble home. Danger and doubt must have hovered around the successful usurper; and he probably escaped a fate like that of Omar, Othman, or Ali. Had he lived longer, enthusiasm might have died and the religion perished. But he left his fame in the hands of men, young, fierce, fired by plunder, resolute to conquer. From the death of Mahomet the spread of his doctrine has never ceased. The number of his followers has ever continued to grow. His missionaries have laid aside the sword to assume the milder garb of teachers and explorers. They are converting the heart of Africa and the islands of the Eastern seas, and it is asserted that what Mohammedanism has lost in Europe, it has more than replaced among

¹ Saint-Hilaire, p. 29. Le monument le plus grave à la fois et le plus authentique—c'est le Coran; il est l'œuvre personnelle de Mahomet, etc.

¹ So Philodemus in the Herculanean papyri traces the elements of morality to Homer, *Περὶ τοῦ καθ' Ὁμήρου ἀγαθοῦ*; or Horace, *Quid sit turpe, quid utile*, etc.

² Noldeke, p. 192, notices its irregularity and its doubtful origin.

the dark races of Senegal or Borneo, and that the Mahometan missionaries are more successful than the Christian in all those barbarous lands. Education must meet and supplant their progress. Wherever knowledge comes, a purer religion will be demanded. Yet it would be ungenerous not to allow that the labors of the Moslems have been of signal use to mankind, or that their Prophet was a teacher of rare merit and success. Illiterate and rude, he has composed a great poem and founded a new sect. A hundred millions of the human race are supposed to obey his law. Five times a day they kneel, repeat his prayers, and, with their faces turned toward Mecca, adore a single deity. Every year a host of worshipers come from Africa, Asia, and Europe to visit the holy places. They touch with awe the sacred soil of Mecca. They pace seven times around the Kaaba, kiss the black stone, and in the vale of Mina cast pebbles at the evil spirits—a relic of the Sabæan rites. They pause before the home of Khadijah, recall the story of their Prophet, survey his simple life, and perhaps wander to Medina to meditate beside his tomb.

HINTS FOR PRACTICAL TROUT-FISHING.

AT this season amateurs and tyros without number are enthusiastically engaged in this exciting and health-giving sport. Each, of course, in imagination expects to do much better this season than last; and to insure more success to those who love this pastime, and to enable those who do not feel fully posted in all the *technique* of this science—for science it is—to improve in skill, these lines are penned: not that the writer expects that everything here set down will be new to all, but in hopes that useful hints may be drawn from it by many, and that at least enough useful information will be gained to pay for the perusal.

I shall confine myself in this article to the capturing, in a sportsman-like manner, the *Salmo fontinalis*, commonly called "brook trout." This fish is found in greater or less numbers in nearly every bubbling running brook in the States of Maine, New Hampshire, Vermont, and in other localities too numerous to mention, where the water flows through unoccupied land, or is situated a reasonable distance from any town or settlement.

Very few are aware how many running brooks contain the fish, unknown to even the inhabitants of near towns or villages. In fact, it may be stated as quite literally true that this fish can be captured in almost any running water, the verdict of surrounding farmers of "no trout" to the contrary notwithstanding. Brooks that

have the name of once containing trout almost always have them now, and often the best of fishing is found in those that have the reputation of being "fished out," as it is almost impossible to exterminate them, and a few years' rest given to any water where some have been left, re-stocks it abundantly for the piscator's recreation. Too many fishermen, wishing good fortune, are apt to be led to fish certain streams known to the surrounding inhabitants, because every body else fishes them, and years ago, as you will hear, such and such quantities were taken by so and so. Unless such water is well known to contain fish, I would advise the fisherman to pass it quietly by, and take the first mountain or hill-side brook that he meets of which no one seems to know any thing, and try his luck there. Scarcely any quick-running brook is without this fish, unless for two reasons—first, if it is well known and persistently fished; secondly, if it has a saw-mill erected upon it, so that the sawdust flows into the stream, the latter in large quantities always driving out trout. Do not, I say, be afraid to try new brooks. The idea, also, that brooks can be completely fished out is, as a rule, erroneous; the water flows often through impenetrable swamps, or such thick under and over growth that it is impossible to fish it its extreme length; hence portions on nearly every brook are left year after year untouched: and unless you can fish the absolute length of any given brook, you can not completely fish it out.

Trout are seldom seen, and unless one has a pole and line, miles might be travelled beside a good brook without seeing a sign of the trout within it. Hence the usual cry of "no trout in this brook." The small brook trout in running streams seldom breaks water, and gives no intimation of his presence, as he does in larger and smoother bodies of water, and even in the latter it is usually only at or near sunset that he is seen or heard, and this generally when he has attained a size larger than the fish to be found in small brooks.

To enjoy this sport thoroughly one must first make up one's mind not to capture many fish beyond seven inches in length; the common and usual size will be about six inches. Do not despise small brooks. One can often kill thirty or forty nice six or seven inch trout by following for a mile or so a bubbling brook not over eighteen inches wide. Trout will exist in water of very little depth, and one of the surprises to those who do not understand the sport is to see fine fish taken from a brook that they would, in their ignorance, have passed by as contemptible. In these small brooks are often little water-falls of a foot or two in height, and at the bottom of some a small

hole of, say, two or three feet in diameter and one or two in depth. In these lurk the trout, waiting under the shadow of the bank or some large stone for the bait to come tumbling down over the miniature fall into their basin; and if this is skillfully done, he is tempted at once to dart from his hiding-place and seize upon it. Now you will perceive that I am not writing for those who are skilled anglers and wish to make a great bag, but for those who enjoy open-air, healthful exercise, and desire to capture in a sportsman-like manner a nice lot of the best size of this delicious fish for cooking purposes.

And now let me try to inform you how to capture them without breaking your pole or losing your tackle or temper. Always, if possible, fish down a stream. There are many reasons for this, among others the following: In fishing up stream the bait is continually coming home to one's feet after every cast, and the nearer it approaches the person, the less chance of a bite. The contrary is the case in fishing down stream; the bait is carried by the current away from the fisherman, and his chances of capture are each moment increased.

If the brook is large enough—and even in very small ones—if practicable, it is always best to wade in the bed of the stream, as by this means one can keep the bait in the water for long distances without making a cast, which, in the localities I am speaking of, almost always, unless skillfully done, ends in one's seeing one's tackle fast to some overhanging bough or bush overlapping the stream. Again, in fishing up stream, it is impossible to keep the bait stationary in any spot one may desire to cast in, unless by standing upon the bank, and the chances of capture are thus greatly decreased; while in fishing down stream, one can not only hold the bait in any one spot, but by a motion of the arm conduct it in any given direction—sink it toward the bottom, draw it up stream, to the right or to the left—to tempt the hidden trout, the motion of the running water upon the bait giving one complete control of it by the slightest motion of the arm. To be successful in this sport, first give up all idea of using artificial flies; there is usually no chance to cast them, and very few fish will rise to them, and then only, usually, at early morn or sunset. Use a light but very short jointed pole, not over twelve feet in length, with fine delicate running gear and small compact reel; small hooks, gauged upon silk-worm gut, of any make that one prefers, there being great diversity of opinion on this matter among fishermen. The Limerick hook has nearly gone out of date, and how it was endured so long is a mystery. The Kirby and Aberdeen have taken its place. Put no lead upon your line at any time; it kills the artistic

and natural motion of your bait. Use, as the most killing bait yet discovered, angle-worms; and these may be much improved by being kept a few days upon clean moss in an uncovered, large-mouthed bottle, that they may scour themselves. In baiting, do not pay the slightest attention to whether the point of your hook is covered or not; it is of small consequence, or rather it is more deadly and better not to be covered than otherwise. The trout does not *nibble*, he *darts*; he takes, as a rule, the bait at once, or leaves it severely alone. You will find no more taking bait the year round than angle-worms, although grasshoppers at certain seasons are very killing. In baiting, take a worm by the middle and pierce the hook through a small portion, say, half an inch; then put on another in the same way at the same time. If the fish are very small, half a worm treated in this manner will do; but a trout has a large mouth, and a large bait no doubt attracts. The dangling ends of the worms placed as above upon the hook have a peculiar and natural motion of their own in the water, which a hungry trout is utterly unable to resist; while one may, on the other hand, cover the whole hook and part of the gut with a worm stiffly strung on without motion, and the same trout will let it be carried past him by the current without winking.

There is a great science in baiting, and it chiefly rests in the skill of having the worms lively, and with the extremities left dangling. The bait is often carried over a little fall into a smooth deep pool; allow it to sink, and all the while it is doing so these four ends of the two worms are moving about in the clear water in a much too enticing way for any chance trout to resist. When you have a bite, do not *pull* at all, but strike your fish, as it is called; this is done by a motion of the wrist, sharp, short, abrupt; not a jerk—a motion which is commenced sharply, but ends almost instantly and abruptly. I can liken it only to a quick movement of the hand in bringing a foil, in fencing, from *tierce* to *carte*. It is done by bringing the finger-nails, which are downward, holding the rod, suddenly to the left and upward, moving the end of the pole upward and to the left some one or two feet. Having struck thus, you will in most cases have captured your fish. Be in no hurry to land him; that is a simpler thing to do; you can do it at your leisure, stepping back to a sure foundation should you be in an uncomfortable position in reaching to make the cast, or make any other disposition that you desire before raising your fish gently from the water, thence to your creel. The great mistake often made by those who do not understand this sport is to *pull* the moment they have a bite; the result usually is to see the trout wind himself round about

some limb overhead, or if he fail to be hooked, which is often the case in pulling, to see the bait and hook in the same position, causing a loss of time, patience, and too often temper, especially when you feel confident that there are other trout in the pool ahead, and become aware of the fact that you have got to make a splash and dash and complete exposure of yourself to get at your dangling line, so that you may fish in vain in the same pool afterward. Remember that trout are very shy, and once having disturbed them, it is useless to fish for them in that spot.

It has been remarked, however, that they notice much less any movement in the stream than on the bank, and one can make much more movement while standing in the bed of a brook than could be made from the bank. The striking of your fish and landing him at your leisure are of great importance. Often the overgrowth will be such that you can not raise your pole but very slightly without getting entangled; here the reel comes in play. Quietly reel in your fish to within a few feet of the end of your pole, and then thrust the latter behind you into the water, grasp the line with the left hand, and raise the fish from the brook. The most fish lost are those that are being unhooked and put into the creel. If the trout is hooked in the upper jaw, he can be snipped, as it is termed, that is to say, you can pull the hook straight out through the nose without waiting to unhook, the flesh yielding readily to the thin shank of the hook and tearing its own way out, there being no bone in the upper jaw to stop it. In the lower jaw you must always unhook the fish, the strong lower jaw-bone preventing your snipping him.

In unhooking, first place the pole lightly against the right shoulder, with the butt in the water, or, in a very swift current, grasp it between the knees. After having caught the line with the right hand about one foot above the pendent fish, bring him against the body on the left side, and confine him with the left hand; seize him round the body with that hand, thrusting the forefinger into the gills, if possible. Being firmly grasped, raise him so as to slacken the line, and unhook with the right hand. A trout almost always gives a last convulsive shake, quick and unexpected, just about the time you have him unhooked, or are passing him to the creel, and if you are not fully prepared for it, back he goes into his native element.

If a fish swallows a hook, do not attempt to extract it by the mouth, but step quietly ashore, and with the fingers force open the gills, detach the hook from the stomach, and draw it out gently through the mouth. Understanding how to do this will save you often much trouble, annoyance, and time.

Change your bait quite often, once at least in every fifteen minutes. Spring water soon kills the worms, and they should be renewed. Do not fish too long in one place. If you have made no noise in approaching, you will usually have a bite the moment your bait flows into a pool, if the trout intend to bite at all. If you get no result in a moment or two, after moving the line about from right to left, and sinking the bait, etc., move on.

In walking in the water, push your feet along. Do not raise them so as to make a noise with the water, or rather concussion, for it has been demonstrated that fish can not hear, but they can, like deaf people, feel concussion. When you allow your bait to sail into a pool, always glance overhead to see how much room you have to land your fish in. This foresight often saves you trouble after you have hooked your fish.

Oftentimes you can, by floating your bait and letting out line from your reel, reach a pool or spot far distant from you without moving your person into the open space intervening. This is often very successful; and your fish once struck, reel in your line to its usual length, so that you can raise your fish with the pole, if the overgrowth will permit.

Of course you are aware that the morning and evening hours are the best for this sport, and a cloudy southerly day the best weather; but in well-stocked brooks these fish will feed all day long, and you can get a good day's sport with almost always a nice wind-up as the sun goes down.

If you are so unfortunate as to entangle your line over your head by drawing out of a pool at a bite, or in casting, and can not clear the same, and feel convinced that there are fish that you do not care to disturb ahead of you, quietly cut your line where you can reach it, tie on a new hook, bait it, and cast again. Your reel should contain about forty yards of braided line especially for these contingencies. Two persons trying to fish one small brook is a nuisance; one alone should fish it. In larger streams, if two persons fish, it is usual for each to fish down to where the other entered the brook, and then make a *détour*, and enter the same, say, one hundred yards ahead of the other, the latter performing the same operation when he comes to the water fished by the person ahead of him; thus each has equal chance of new water. Give your bait plenty of air, and do not put water upon it, unless you wish to see it shortly putrid and destroyed. Clean moist earth is the best. On a warm day, by using moss in your creel, you will preserve the fish you kill in a much better state than you otherwise would. Dipping the creel in the brook water once or twice during the day will do no harm, if the weather be very hot.

"THE HOST OF HAY-COCKS SEEMED TO FLOAT
WITH DOUBLES IN THE WATER."

INSIDE PLUM ISLAND.

WE floated in the idle breeze,
With all our sails a-shiver;
The shining tide came softly through,
And filled Plum Island River.

The shining tide stole softly up
Across the wide green splendor,
Creek swelling creek till all in one
The marshes made surrender.

And clear the flood of silver swung
Between the brimming edges,
And now the depths were dark, and now
The boat slid o'er the sedges.

And here a yellow sand spit foamed
Amid the great sea meadows,
And here the slumberous waters gloomed
Lucid in emerald shadows.

While, in their friendly multitude
Encamped along our quarter,
The host of hay-cocks seemed to float
With doubles in the water.

Around the sunny distance rose
A blue and hazy highland,
And winding down our winding way
The sand hills of Plum Island—

The windy dunes that hid the sea
For many a dreary acre,
And muffled all its thundering fall
Along the wild South Breaker.

We crept by Oldtown's marshy mouth,
By reedy Rowley drifted,
But far away the Ipswich bar
Its white-caps tossed and shifted.

Sometimes we heard a bittern boom,
Sometimes a piping plover,
Sometimes there came the lonesome cry
Of white gulls flying over.

Sometimes, a sudden fount of light,
A sturgeon splashed, and fleeting
Behind the sheltering thatch we heard
Oars in the rowlocks beating.

But all the rest was silence, save
The rippling in the rushes,
The gentle gale that struck the sail
In fitful swells and gushes.

Silence and summer and the sun,
Waking a wizard legion,
Wove as we went their ancient spells
In this enchanted region.

No spectral care could part the veil
Of mist and sunbeams shredded,
That every where behind us closed
The labyrinth we threaded.

Beneath our keel the great sky arched
Its liquid light and azure;
We swung between two heavens, ensphered
Within their charmed embrasure.

Deep in that watery firmament,
With flickering lustres splendid,
Poised in his perfect flight, we saw
The painted hawk suspended.

And there, the while the boat-side leaned,
With youth and laughter laden,
We saw the red fin of the perch,
We saw the swift menhaden.

Outside, the hollow sea might cry,
The wailing wind give warning;
No whisper saddened us, shut in
With sunshine and the morning.

Oh, far, far off the weary world
With all its tumult waited,
Forever here with drooping sails
Would we have hung belated!

"THERE, ALL DAY LONG, THE SUMMER SEA CREAMS MURMURING UP THE SHINGLE."

Yet when the flaw came ruffling down,
And round us curled and sallied,
We skimmed, with bubbles on our track,
As glad as when we dallied.

Broadly the bare brown Hundreds rose,
The herds their hollows keeping,
And clouds of wings about our mast
From Swallowbanks were sweeping.

While evermore the Bluff before
Grew greenly on our vision,
Lifting beneath its waving boughs
Its grassy slopes Elysian.

There, all day long, the summer sea
Creams murmuring up the shingle;
There, all day long, the airs of earth
With airs of heaven mingle.

Singing we went our happy way,
Singing old songs, nor noted
Another voice that with us sang,
As wing and wing we floated.

Till hushed, we listened, while the air
With music still was beating,
Voice answering tuneful voice, again
The words we sang repeating.

A flight of fluting echoes, sent
With elfin carol o'er us—

More sweet than bird-song in the prime
Rang out the sea-blown chorus.

Behind those dunes the storms had heaped
In all fantastic fashion,
Who syllabled our songs in strains
Remote from human passion?

What tones were those that caught our own,
Filtered through light and distance,
And tossed them gayly to and fro
With such a sweet insistence?

What shoal of sea-sprites, to the sun
Along the margin flocking,
Dripping with salt dew from the deeps,
Made this melodious mocking?

We laughed—a hundred voices rose
In airiest fairest laughter;
We sang—a hundred voices quired
And sang the whole song after.

One standing eager in the prow
Blew out his bugle cheerly,
And far and wide their horns replied
More silverly and clearly.

And falling down the falling tide,
Slow and more slowly going,
Flown far, flown far, flown faint and fine,
We heard their horns still blowing.

"ACROSS THE SHADOWY MERRIMAC THE CHANNEL LIGHTS CAME STREAMING."

Then, with the last delicious note
To other skies alluring,
Down ran the sails; beneath the Bluff
The boat lay at her mooring.

Came they, these subtle powers, to tell
The poet, at their revels,
How blest to live delightful days
Among these meadow levels?

Blest as to lead his lonely thought
Above horizons vaster,
Close to the stars, transfigured on
The awful heights of Shasta!

Dreaming, he loitered still, we thought,
Within his dream's bright portals;
We trifled with the hour, but he
Had been with the immortals!

In vain, at night, we sought that sound—
Stars over us and under
Through all that watery wilderness
Building a world of wonder;

Or darkling, when the light-house spark
Its witch-dance kept before us,
Or when the unseen moon distilled
Her deathly glamour o'er us;

Or when, the twin lamps of their towers
Emerald and ruby gleaming,
Across the shadowy Merrimac
The channel lights came streaming.

In vain our lingering halloo,
Our roundelay untiring,
No silver cry chimed far or nigh
Of all that silver quiring.

Oh, never since that magic morn
Those strains the boatman follows,
Or piping from the sandy hills,
Or bubbling from the hollows!

Yet long as summer breezes blow,
Waves murmur, rushes quiver,
Those warbling echoes every where
Will haunt Plum Island River!

POPULAR EXPOSITION OF SOME SCIENTIFIC EXPERIMENTS.

PART V.—THE DIFFRACTION SPECTRUM.

WHAT is a diffraction spectrum? Every person who has read a book on light is familiar with the prismatic spectrum, in the study of which Newton displayed his transcendent philosophical powers. The diffraction I have had occasion to refer to several times in these papers, and since it is less known, will now describe it. Some very curious phenomena connected with it I have personally examined. It carries us to a true interpretation of the relations of heat, light, and actinism; it offers some important suggestions respecting the mode of action of that most wonderful of all organs, the brain, and therefore commends itself to our most earnest attention.

If we look at a candle flame placed ten or a dozen feet distant, the eyelids being so nearly closed that the eyelashes intercept the incoming rays, we see on either side of the true image of the flame a succession of colored ones—rainbow streaks or fringes, as it were. Examining these particularly, we find that each of them is blue on the side nearest to the true image, and red on the more distant. Our investigation will be simplified if we consider the action of a single eyelash. We can then reason from that to the conjoint action of all.

It is necessary, however, in the first place, to recall some facts connected with the wave theory of light. The foundations of this theory were laid by Huyghens, the great Dutch philosopher, contemporary with Newton, but its construction advanced very slowly, being opposed by the great authority of Newton, who favored the corpuscular or emission theory, and regarded light as consisting of particles emitted with excessive velocity from shining bodies. Although there were facts, such as those connected with double

refraction, easily accounted for by the system of undulations, but inexplicable on the emission theory, these were put aside, in the expectation that they would in the course of time be successfully dealt with. It was not until the publication of his course of lectures on natural and experimental philosophy by Dr. Young in 1802, in which he announced the great discovery of the interference of light, that the undulatory theory could no longer be overlooked. This discovery was, however, still ridiculed by the *Edinburgh Review*, and Young's explanations so bitterly attacked that he was constrained to publish a pamphlet in reply. Of this it is said that only a single copy was sold.

In 1819, a memoir by Fresnel was crowned by the French Academy of Sciences. He discovered that the vibratory movements in the ether constituting light are perpendicular to the course of the ray. His views are embodied in what is now known as the theory of transverse vibrations.

The conflict between the rival theories was eventually settled by the experiments of Fizeau and Foucault. On Newton's principles the particles of light should move faster through water than through air; on the theory of Huyghens, waves of light must move slower in water than in air. The experiments of the French physicists proved that the latter is the case. This may, then, be considered as the successful establishment of the undulatory theory. It has, moreover, given that striking proof of its truth which may be considered as the criterion of any theory—the ability to foretell results. This it did in the case of the discovery of conical refraction.

Light, therefore, consists in the transference of energy or force, not in the transference of matter.

From this brief historical sketch we may now turn to a mechanical representation of the facts.

The cause of light is an undulatory movement taking place in the ethereal medium. That such a medium exists throughout all space seems to be proved by astronomical facts. It exerts a resisting agency on bodies moving in it. From its tenuity we should expect that it would scarcely impress any disturbance on the great planetary masses, but on light gaseous cometary bodies it produces a perceptible action. The comet of Encke, of which the period is about 1200 days, is accelerated in each revolution by about two hours. As there is no other obvious cause for results of this kind, astronomers have very generally looked upon them as corroborative proofs of the existence of a resisting medium—that universal ether to which so many other facts point.

Through this elastic medium undulatory movements can be propagated as sounds may be transmitted through the air. It must be clearly understood that the ether and light are different things, though popularly they are often confounded; the latter is merely the effect of movements in the former. Atmospheric air is one thing, and the sound that traverses it another. The air is not made up of the notes of the gamut, nor is the ether composed of the seven colors of light.

Across the ether, undulatory movements, resembling in many respects the waves of sound in the atmosphere, pass with prodigious velocity. From the eclipses of Jupiter's satellites as interpreted by Römer, and from the aberration of the fixed stars as interpreted by the grand discovery of Bradley, it appears that the rate of the propagation of light, or the velocity with which these waves advance, is about 186,000 miles in a second. We are not, however, to understand by this that the ethereal particles rush forward in a rectilinear course at that rate. Those particles, far from advancing onward, remain stationary.

Fig. 1

If we take a long cord, *a b*, Fig. 1, and having fastened it by its end *b* to a fixed obstacle, agitate the end *a* up and down, the cord will be thrown into wave-like motions, passing rapidly from one end to the other. This may afford us a rude idea of the nature of the ethereal movements. The particles of which the cord is composed do not advance or retreat, though the undulations

are rapidly passing. Such an illustration shows that there is no transfer of matter from *a* to *b*, but there is a transfer of force. The energy that was exerted at *a* is delivered at *b*. Moreover, it illustrates the difference between the theories of Newton and of Huyghens. On the former, the material particles of which the cord consists should be translated from *a* to *b*; on the latter, the energy or force.

So, too, if on a surface of water we make a tapping motion with the finger, circular waves are propagated, which, expanding as they go, soon reach the sides of the vessel which holds the water. A light object, such as a small shaving of wood, is not swiftly drifted forward by the waves; it simply rises up and sinks down as they flow beneath it, but so far as advance is concerned, it is entirely motionless. We see, therefore, that there is a wide difference between the motions of a wave and the motions of particles among which it is passing. They retain their places, but it flows rapidly forward.

A distinction is to be made between the terms vibration and undulation. In the case of the cord represented by Fig. 1, the vibration is indicated by the movement exerted by the hand at the free extremity, *a*; the undulation is the wave-like motion that passes along the cord. Each constituent part of the cord also vibrates. In the illustration derived from water, the vibration is represented by the tapping motion of the finger, the undulation by the resulting wave, of which the constituent portions also move up and down. Throughout the ethereal medium each particle vibrates, and transmits the undulatory effect to the particles all around it.

This constitutes what is known as "the principle of Huyghens." It may be thus expressed: "When an undulatory movement is propagated through an elastic medium, every particle imitates the movement of the particle first excited. But every particle stands, in regard to the adjoining ones, in exactly the same relation that the first particle did to its neighbors, and consequently must exert upon those that surround it exactly the same influence as did the first. Every vibrating particle is, therefore, to be regarded as if it were the originally excited particle of a wave system. Thus all points of a wave, *b b*, Fig. 2, coming from an original centre of disturbance, *a*, may be regarded as new centres of disturbance, and from them an innumerable series of elementary waves of equal size will have formed, represented by the little arcs. The circle *d d* described around the centre *a*, which all these elementary waves simultaneously touch, represents the limit to which the wave movement has at that instant been propagated. The vibration which previ-

Fig. 2

ously affected the wave *bb* is now transferred to *dd*, at which all the elementary waves have arrived in the same condition of vibration. The wave *bb* has thus propagated itself, by means of the elementary waves, in the same form and with the same rapidity, to *dd*, as if it had proceeded directly from the original point of disturbance, *a*. It might, therefore, seem immaterial whether we admit a direct propagation of a single wave centre outward or an indirect propagation by innumerable intervening waves. But the latter alone is true, for it considers the relations of all the particles of the undulating medium. The former leads to the conception of a direct propagation along a single straight line, that is, the possible existence of a single ray of light. The latter requires a consideration of the action which every particle of the ethereal medium must exert upon all the adjoining ones, and according to it the existence of an isolated ray of light is impossible."

To refer again to the simple illustration given in Fig. 1, it is obvious that there is an infinite variety of directions in which we may vibrate that cord or throw it into undulations. We may move it up and down, or horizontally right and left, and also in an infinite number of intermediate directions, every one of which is perpendicular or transverse to the length of the cord, as *cc*, *dd*, *ee*, *ff*, Fig. 3. This is the peculiarity of light. The ethereal vibrations are transverse to the course of the ray; and in this it differs from sound, of which the vibrations are normal, that is to say, executed in the

Fig. 3

direction of the resulting wave, and not at right angles to it.

This great discovery of the transverse vibrations of light was that to which I have previously alluded as made by Fresnel. It is the fundamental fact of the whole theory

of optics, and offers so simple but brilliant an explanation of so many of the phenomena of light that the undulatory theory is by some writers designated *the theory of transverse vibrations*.

It may, however, be remarked that though light consists of rays originating in these transverse motions, it is not impossible that there may be other phenomena corresponding to movements in other directions. Since the time of Fresnel several great mathematicians have shown that we ought not to overlook them. In the same manner there may be motions in the air due not to normal but to transverse vibrations, though to these our ear is perfectly deaf. It is a most interesting reflection, as showing the prevision, the foresight, of science, that organs of vision and organs of hearing may possibly be constructed on types differing from those of ours—eyes that can perceive normal vibrations in the ether, ears that can distinguish transverse sounds in the air.

Lights differ from each other in two striking particulars—brilliancy and color. These are determined by certain affections or qualities in the waves. On the surface of water we may have a wave not an inch in altitude, or others, as the saying is, "mountains high." Under these circumstances waves are said to differ in amplitude, and transferring this illustration to the case of light, a wave the amplitude of which is great impresses us with a sense of intensity or brilliancy; but a wave the amplitude of which is small, is less bright. A rude illustration may perhaps convey a clear idea of this. The cord *ab*, Fig. 1, may be agitated by movements of the hand within the limits of an inch, or by others that extend to a foot. The former will give rise to waves of small, the latter to waves of greater, intensity.

By the length of a wave upon water is meant the distance that intervenes from the crest of one wave to that of the next, or from one depression to the next. Thus, in Fig. 4, from *a* to *b*, or, what is the same, from *c* to *d*, constitutes the length of a wave.

Fig. 4

In the ether the length of the waves determines color. This may be rigorously proved, as we shall see when we come to the methods by which the absolute lengths of undulations are ascertained. It will then be found that the longer waves impress the mind as red light, the shorter as violet, and those of intermediate magnitudes produce the other colors.

Two rays of light, no matter how brilliant

they are separately, may be brought under such relations to one another as to destroy each other's effect, and produce darkness. Light added to light may produce darkness. It was the investigation of this wonderful phenomenon by Dr. Young that led him to the discovery of interference.

We meet with a similar effect in acoustics. Two sounds may bear such a relation to each other that they shall produce silence, and two waves on the surface of water may so act on each other that the water shall not move.

If two waves of sound produce silence, or two waves of light produce darkness, they are said to have interfered with each other. We can gather an idea of the mechanism of interference by considering the case of waves upon water, in which, if two undulations encounter each other so that the crest of the one corresponds to the trough of the other, they mutually neutralize each other, though, after the interference is over, they proceed as if they had not met. Let us examine more critically this affair of interference: it leads us at once to an explanation of the diffraction spectrum, to which we have been, in the foregoing paragraphs, gradually approaching.

If two systems of waves of the same length encounter each other, after having come through paths of *equal* length, they will not interfere. Nor will they interfere even though there be a difference in the length of their paths, provided that difference be equal to one whole wave, or 2, 3, 4, etc.

But if two systems of waves of equal length encounter each other after they have come through paths of *unequal* length, they may interfere, and that interference will be complete or total when the difference of the paths through which they have come is half a wave, or $1\frac{1}{2}$, $2\frac{1}{2}$, $3\frac{1}{2}$, etc.

Fig. 5

These cases are respectively shown at *a b* and *c d*, Fig. 5, at the point of encounter, *x*. In the second instance, *c d*, the two sets of waves are in the same phase; that is, their concavities and convexities respectively correspond, and there is no interference; but in the first case, at the point of encounter, *x*, the two systems are in opposite

phases, the convexity of the one corresponding with the concavity of the other, and interference takes place.

Fig. 6

Upon these principles we can readily account for the remarkable results of the following experiment. From a lucid point, *S*, Fig. 6, let rays of red light emerge, and in them let there be placed an opaque object, *a b*—a cylindrical body, seen endwise in the figure. At some distance beyond this let there be a screen of white paper, *c d*, to receive the shadow of the opaque object. It might be supposed that this shadow should be of a breadth included between *x y*, because the rays, *S a*, *S b*, which pass the sides of the obstacle, *a b*, impinge on the paper at those points. It might further be expected that within the space *x y* the shadow should be uniformly dusky or dark, but, on examining it, such will not be found to be the case. It is much broader than it ought to be, and both in its middle regions and in those exterior to its proper geometrical limits consists of a succession of bright red and dark stripes, as was first discovered by the Italian Grimaldi. In its central part, at *e*, there is a bright stripe, this is succeeded on each side by a dark one, this again by another bright one, and so on alternately. Thus the light must have doubled round to the

back of the opaque obstacle, in this resembling sound, which easily doubles round a corner. Newton had affirmed that light could not thus pass to the back of an obstacle, and this furnished one of his most formidable objections to the undulatory theory.

Sounds easily pass round a corner, and are heard though an obstacle intervene. Waves upon water pass round to the back of an object on which they impinge, and the undulations of light in the same manner flow round at the back of the cylindrical object *a b*.

Now it is plain that the two series of waves which have passed from the sides of the obstacle to the middle of its shadow—that is, along the lines *a e*, *b e*—have gone through paths of equal length, and therefore when they encounter at the point *e* they will not interfere, but exalt each other's effect.

Leaving this central point, *e*, and passing to *f*, it is plain that the systems of waves that have come through the paths *a f*, *b f*, have come through different distances, for *b f* is longer than *a f*; and if this difference be equal to the length of half a wave, they will, when they encounter at the point *f*, interfere with and destroy each other, and a dark stripe must result.

Beyond this, at the point *g*, the waves from each side of the obstacle, *a g*, *b g*, again have come through unequal paths; but if the difference be equal to the length of one whole wave, they will not interfere, and a bright stripe results.

Reasoning in this manner, we can see that the interior of such a shadow consists of illuminated and dark stripes alternately: illuminated when the light has come through paths that are equal, or that differ from each other by 1, 2, 3, etc., waves, and dark when the difference between them is equal to $\frac{1}{2}$, $1\frac{1}{2}$, $2\frac{1}{2}$, etc., waves.

What has been said as regards the bright and dark stripes between *e* and *x* might be repeated for the space between *e* and *y*, which also presents a similar alternation.

That it is the interference of the light coming from the opposite sides of the opaque object which is the cause of these phenomena is proved by the fact that if we place an opaque screen on one side of it so as to prevent the light passing, all the fringes disappear.

The experiment just related enables us to explain how the length of a wave of light may be determined. If we measure the distances *a g* and *b g*—that is, from the sides of the obstacle to the first bright stripe, *g*—the difference in the length of those lines is equal to the length of one wave. We might employ the second bright stripe; the difference then would be equal to two waves.

In practice, however, there are better methods of doing this; it would not be easy to execute the measures in the manner here described with exactness; but I have preferred this mode of presenting the subject, as it enables us to see very clearly the principle involved.

Now if, instead of using red light radiating from the lucid point *S*, we use other colored lights, yellow, green, blue, etc., in succession, it will be found that the wave length differs in each case, that it is greatest in the red and smallest in the violet light.

And if, instead of using a single obstacle or wire, a number of very fine ones be stretched side by side on a frame parallel to each other, they constitute what may be spoken of as a grating. This, indeed, was the apparatus which Fraunhofer, the discoverer of the diffraction spectrum, first employed. Around two screws, *a, a* (Fig. 7), having similar and very close threads, he wound a very fine wire,

b b, so that in the interval, *c c*, between the screws the successive strands of the wire were very close and parallel to each other. The analogy of this construction to the eyelashes may

be readily perceived. Subsequently he found that a much better contrivance was obtained by ruling with a diamond on a piece of flat glass straight lines close and parallel to each other. The lines so drawn represented the wires of the former instrument, and the intervals of clear glass between them the interspaces.

The ruling of such lines so as to constitute a good grating or gitter is one of the most delicate and difficult of mechanical problems; it has exercised the ingenuity of the most skillful mechanical artists. The surfaces of the glass must be truly plane, and the screw of the ruling apparatus perfect in its form and correct in its action; it must be driven by a uniformly acting motor power. The quality of the diamond is very important; it must not lose its point or edge too readily, or the lines of the grating it is making will not be similar to each other. The figure of its cutting part is of the utmost moment, as on it depends the figure or form of the groove or scratch that is made.

Mr. Rutherford, of New York, has succeeded most perfectly in overcoming these difficulties, and by an exquisite machine of his own invention and construction, has produced the most perfect gratings hitherto made. In the hope of promoting an experimental study of the diffraction spectrum, and thereby increasing a knowledge of the nature of light, he has generously presented many of these invaluable and otherwise inaccessible instruments to those who could make suitable use of them. In this, science is under great obligations to him.

The grating I employed in the experiments hereinafter related was made for me by Mr. Saxton, at the United States Mint in Philadelphia, more than thirty years ago. Though from the work it did for me I can not but speak of it with admiration—it enabled me to make the first photograph that was ever executed of the diffraction spectrum—yet it was far from being equal to the magnificent ones of Mr. Rutherford. This grating was five-eighths of an inch long and one-third of an inch in breadth. Mr. Rutherford's gratings have in some specimens 17,240 lines to the inch. I had found previously to 1843 that it is more advantageous practically to use a reflecting than a transparent grating, and accordingly I silvered mine with mercury-tin amalgam, such as is used in ordinary looking-glasses. Mr. Rutherford's reflecting gratings are coated with

pure silver, by an operation more recently discovered.

I will now relate the use of these gratings, and describe some of the important discoveries made by them.

Let a beam of light, $S A'$, Fig. 8, pass through a narrow slit, S , and fall perpendic-

ularly on the ruled grating, G , the lines of which are parallel to the sides of the slit. Concentric with the middle line of the grating let there be placed a circular zone or screen, Q', Q'', Q''', Q'''' , of white paper, through which there is an opening at A , to admit the intromitted beam.

A beam of parallel rays passing along $S G$ will give a bright image of the slit S when it impinges on the screen at A' . This is the image by transmission. It would also give another similar image at A , were it not for the opening arranged there. This is the image by reflection. Also from G , as from a central axis, there fall upon the cylindrical paper zone, covering its surface all over, an infinite number of radiations.

These effects are seen with much more precision if there be placed behind the grating a convex lens, or, still better, if the lens be the objective of a telescope.

Now the eye can only be impressed by special radiations consisting of waves of a determinate length. Its vision is limited to those that impart to it a sensation of red on one hand, and of violet on the other. To all others it is blind. Then, though the whole

paper zone is receiving radiations of every kind, the eye selects out only those that it can perceive, and, as a result, sees in the four quadrants, Q', Q'', Q''', Q'''' , those only for which it is fitted. It follows, therefore, that at A' there is a white image of the slit S , and to the right and left of this there are equal spaces, p, p' , completely dark. Beyond, and symmetrically on each side, there is a series of spectra, $v r, v' r', v'' r'',$ etc., of which the violet ends are nearest A' , and the red ends most distant. These spectra are designated respectively as being of the 1st, 2d, 3d, etc., order. On each side the 1st spectrum is separated from the 2d by an obscure space, $r v'$, which is shorter than the first dark spaces, p, p' , and the red end of the 2d spectrum is overlapped by the violet of the 3d. In like manner the 3d is overlapped by the 4th, etc. If the intromitted ray be of sunlight, and a convex lens or small telescope be used, the dark Fraunhofer lines are seen in these spectra.

Such are the results seen in the quadrants Q''', Q'''' , from the light transmitted through the grating. In the quadrants Q', Q'' , exactly the same train of phenomena will be discovered—dark spaces and spectra, the latter having their violet ends nearest to A , and the overlapping of

successive ones taking place in the manner above described.

Since the results are thus symmetrical in all the four quadrants, it is sufficient to select one of them for detailed examination. Let it be the quadrant Q'''' .

Selecting one of the fixed lines, that in the yellow space, the sodium line D , for example, in the successive spectra, it will be found that the distance which intervenes between it and the middle of the white image A' is in the second double, in the third triple, etc., the distance it is in the first. These angular distances are designated as the deviations of the ray under examination. Fraunhofer proved that

(1) The deviation of the same ray, *e. g.*, D , depends on the sum of the width of a groove in the grating and of a transparent interval, being in the inverse ratio of that sum.

(2) The deviation of any one of the colors of the spectrum of the first order, multiplied by the sum of a transparent interval and a groove, gives the length of a wave of light of that color.

(3) The deviations of the same color in

Fig. 8

the successive spectra increase as the whole numbers, 1, 2, 3, 4, etc.

(4) The deviations of two colors in the same spectrum are to each other as the length of their undulations. Hence in all the violet is nearest to A', and the red the most distant.

The undulatory theory gives a rigorous explanation of all these facts. The lengths of the waves of light have hence been most critically and accurately determined.

We may now examine more closely the spectrum that is nearest to A'—the spectrum of the first order. Being completely separated from the others, it presents the special facts most distinctly. At the point where the light first becomes visible—the violet or inner end of this spectrum—the wave length of the incident radiation is, as Angström has proved, 3933, and the wave length of the last visible radiation at the outer or red end is 7604, ten-millionths of a millimeter. If we accept the velocity of light as determined by the experiments of Foucault, the number of vibrations made by the ether in the former of these radiations is 754 millions of millions in one second, and the number in the latter case is 392 millions of millions in one second.

Or to quote measures which are perhaps more familiar, and numbers as given by Herschel, though not so exact as those of Angström, the number of undulations contained in one English inch at the extreme violet end is 59,750, and the number of vibrations executed in one second is 727,000,000,000,000. The number of undulations in one English inch at the extreme red end is 37,640, the number of vibrations executed there in one second being 458,000,000,000,000. The velocity of light used in these computations is 192,000 miles per second, that used in the preceding paragraph, 186,000.

Knowing the rate at which light moves in a second, and the wave length of any particular color, it is easy to compute the number of vibrations made by the ether in one second for the production of that color. This is obtained by dividing the distance that light passes over in one second by the wave length of the color in question.

The numbers we thus obtain give us an idea of the scale of space and time upon which Nature carries forward her works among the particles of matter. They also indicate to us the amazing activity of those portions of the brain which execute motions in accordance with those scales.

The distribution of the colored spaces in the diffraction spectrum is not the same as in the prismatic. In the former the yellow space, which is the most luminous radiation, is in the middle of the spectrum, and is not crowded down or compressed toward the red end, as in the latter. So the maxi-

mum intensity or illuminating power is, as Mosotti first observed, in the centre, the intensity of the light declining symmetrically on each side to the end.

The Italians have a clear perception, a quick appreciation, of the symmetrical and beautiful. When Mosotti first stated this peculiarity of the diffraction spectrum, at a meeting of one of the Italian scientific societies, the announcement was received by the audience with loud acclamations of joy.

I may now describe some of my own studies of these beautiful spectra.

Recalling, then, the principle that the wave length of an incident radiation is proportional to its deviation, let us select upon the paper zone previously described the point where a ray is falling having a wave length 7866. It is, of course, twice as far from A' as was the violet end of the first spectrum, for the selected deviation is double. If we inquire what interpretation the mind will give of a radiation having such a wave length, an inspection of the zone shows that not only is it visible, but that it is regarded as being of a violet color.

This is an important fact. We find that a radiation consisting of waves of a given length which is visible will also be visible when the constituent waves are twice that length. And in like manner it might be shown that the same will hold good when they are three, four, five, etc., times that length. Moreover, in all these cases the color impression imparted to the mind will be the same.

Again, let us select upon the paper zone another point, where the wave length is 15,208. It will have double the deviation of the red end of the first spectrum. Now, agreeably to the foregoing remarks, this point should be visible to the eye, and, for any thing that has thus far been said, it should be interpreted by the mind as red light, its wave length being twice that of the red of the first spectrum. But it is obvious that here a new consideration must enter into account. If this radiation has double the wave length of the first red, it has triple the wave length of the first yellow-green. On the principle just laid down, the mind may interpret it as red light or as yellow-green. Which will it do?

Examination of the paper zone, or, better still, through a telescope, shows that the mind adopts both these interpretations, and the same principle applying to other wave lengths, this constitutes what we have spoken of as the overlapping of the second spectrum by the third, etc. At the point here specially considered, both red and yellow-green light are seen.

From what has here been presented, it follows that the principle considered as established in optics, that to every color there belongs a determinate wave length, must be

modified, since the same color impression will be given to the mind by waves that have twice, thrice, etc., that determinate wave length. But should the wave lengths under consideration answer to multiples of that of some other color, the mind will interpret them as being of that color too.

Moreover, these observations lead us to extend the range of perception of the eye. The prism would lead us to infer that it can only be affected by waves the length of which is between 3933 and 7604. Comparisons have hence been drawn between the organ of vision and the organ of hearing, to the disparagement of the former. The ear, it is said, can embrace a range of several octaves, but the eye is influenced by less than one. The grating, however, leads us to reject the restriction, and to place the eye more nearly on an equality with the ear.

It is also to be borne in mind that by using very condensed sunlight, or by resorting to fluorescent or other optical contrivances, as several experimenters have done, the range of vision may be carried beyond the proper violet limit.

The principles here indicated must not be restricted to the luminous radiations; they apply to all others too. Thus if a photographic sensitive surface be made to receive the first spectrum, it will be impressed by certain of its radiations, chiefly by those above the line G. If it be exposed in the second, third, etc., spectra, it will again be impressed by the corresponding undulations, having two, three, etc., times the former length. From this it may, therefore, be inferred that a chemical decomposition of a given substance, brought about by undulations of a certain length, will also be accomplished by radiations that are octaves of the first.

It has been stated that a dark space, p , intervenes between the violet end of the first spectrum and the bright streak A' . This dark space is at present an attractive and wonderful field of optical investigation.

Fig. 9

In Fig. 9, let A' represent the white streak in the position of A' in Fig. 8; then from A' to v is the first dark space, p ; from v to r , the spectrum of the first order, its violet end, v , nearest to A' , its red end, r , more distant; from r to v' , the second dark space; and from v' to r' , the spectrum of the second order. The third spectrum overlaps this second, and the fourth the third, etc.; but these

it is not necessary to consider. The two dark spaces, and especially the first, are the objects mainly to be examined.

Previously to 1844 I had attempted to obtain diffraction photographs with the grating that Mr. Saxton gave me, and had met with great success. In that year I published engravings of them, the originals having been made on silver daguerreotype tablets, in use at that time. By these I carried spectrum impressions as far as the wave length 3800, and therefore encroached considerably on the dark space p , toward A' . But collodion, since introduced, is a much more sensitive preparation. It has enabled Henry Draper, who has produced superb photographs of the more refrangible regions, to carry the impressions as far as 3032.

According to M. Mascart, waves are emitted by incandescent cadmium having a length not exceeding 2200. These stand still further in the dark space p .

In these excursions into the dark space the experiments of Professor Stokes on the long spectrum of electric light become not only interesting, but very important; for as we gradually approach A' , the wave length of the incident radiation is continually diminishing, and at A' it becomes zero. That point is the supreme limit, beyond which no radiant manifestation of any kind is possible.

The goal toward which experimental investigation is tending is therefore obvious. We are gradually groping the way across the dark space, and expect one day to reach the bright streak that lies at its terminus. At every step of advance the ether waves are becoming shorter and shorter, and the vibrations more and more rapid. When the journey is accomplished, a region will have been gained in which the waves are infinitely short, and the vibrations infinitely rapid.

Several years before the announcement of the discovery of photography by Daguerre and Talbot (1839), I had made use of that process for the purpose of ascertaining whether the so-called chemical rays exhibited interference, and in 1837 published the results in the Journal of the Franklin Institute, Philadelphia (July, 1837, p. 45).

As this may be of interest, since it is perhaps one of the earliest attempts made in America of the

application of a photographic operation in the investigation of a physical problem, I will quote the statement in full. It may be premised that I had previously found an advantage in using the bromide of silver instead of the chloride, the former being very much more sensitive to light.

“Interference of the Chemical Rays.”—Under certain circumstances, two aerial vibrations,

each of which, if separately striking the organs of hearing, would produce a musical sound, may so interfere with each other as to produce an unmelodious rattling, or even silence. Also, two rays of light, the paths of which bear a certain relation to one another, instead of increasing each other's intensity, may have a directly opposite effect, and, neutralizing each other, produce darkness. It becomes, therefore, a question not only of mere curiosity, but one the bearings of which are important, to find if the chemical rays emitted by the sun, when placed under similar circumstances, exhibit similar phenomena. For then analogy would lead us to know that it is possible for two rays of heat to be so situated with regard to each other that, instead of exalting the temperature of a body on which they fell, they would lower it, or, in other words, produce cold.

"In my early attempts at the solution of this question I met with many disappointments, but at last I fell upon an arrangement which succeeded. A horizontal beam of light being projected into a room by the apparatus heretofore referred to, at the extremity, *e e*, Fig. 10, of a brass tube, a con-

Fig. 10

vex lens of short focus was screwed; this brought the rays to a point at a distance of three-quarters of an inch from the lens. They were then obstructed by a metallic screen, *b b*, having a hole, *c*, one-eighth of an inch in diameter perforated in it. This screen revolved on a pillar, *d*, so that it could be brought to any angle with the incident rays. The rays passing through the round hole *c* were received on a white screen, *g g*, at a distance of six inches. When the screen *b b* received the incident rays perpendicularly to its surface, then of course the image thrown on the screen *g g* was circular, but if the screen *b b* was made to receive these rays at an acute angle, the image was lenticular. Under this last condition, the phenomena of diffraction are represented in Fig. 11, where *a a*

Fig. 11

is the screen, *b b* the lenticular image cast on it; it is bright white, except at its central part, *c*, where there is a dark image produced by the interference of the passing rays.

"If in such an arrangement the chemical rays do not interfere with each other so as

to neutralize effects, chemical action should be produced in every part of the image, even including its central part, *c*; but if, on the other hand, these rays are obedient to the same laws as the rays of light, then in the central parts of the image no chemical effects should ensue; the problem is, therefore, reduced to the finding how any compound changeable by these rays will comport itself on the central and peripheral parts of such an image.

"In place of the screen *g g* a substitute was used, consisting of two thin plates of mica with a layer of bromide of silver included between them. These were mounted on a little ivory frame, *a b c d*, Fig. 12, in the manner that objects are usually mounted for the use of the microscope, and the lenticular image cast upon the bromide. After an exposure of five minutes, during which care was taken to keep the sun's place immovable, and also to avoid all local tremor, which might make the image traverse on the bromide, the result was very apparent, being as represented in Fig. 13, of the actual size: the peripheral parts were of a deep brown, and the centre yellowish-white. Viewed through a lens, the boundary line was not sharp and distinct, but seemed to merge by an insensible gradation into the unaffected part, as in Fig. 14. The conclusion to be drawn from this result possesses no common interest; for the same reasoning which demonstrates that light consists of undulations in an elastic medium applies in this case also."

Fig. 12

Encouraged by this result, I some years subsequently attempted to photograph the diffraction spectrum itself. The following is an extract from the publication I made of this experiment in 1844: "Through a narrow fissure or slit, *a*, Fig. 15, I direct a beam of light horizontally, and at a distance of twelve feet receive it on a grating, *b c*, the lines of which are parallel to the slit. Having found that there are advantages in using a reflecting grating, I silvered this with tin-amalgam, which copies the ruling perfectly. There is no difficulty in placing *b c* so that the ray coming from *a* falls perpendicularly on it, for all that is required is to move the grating into such a position that the light, after reflection from it, goes back through the fissure *a*. At a distance from *b c* of six inches I place an achromatic object-glass,

Fig. 13

Fig. 14

Fig. 15

d, in such a position that it shall receive perpendicularly the reflected rays of the spectrum of the first order. The lens is brought as near to the grating as possible without its edge intercepting the ray coming from *a*. In the focus of this lens, at *e f*, a ground glass is placed. This portion of the apparatus is, however, nothing more than the sliding part of a common photographic camera, which contains the ground glass and shields for sensitive preparations."

In the publication above referred to I gave engravings of the results thus obtained; the fixed lines were marked by their wave lengths. The photographs were very clear and beautiful; they bore magnifying six or eight times without injury to their sharpness.

I may here be permitted to add that it was on the publication of these researches in 1844 that I first made the suggestion to describe spectrum effects by wave lengths, or what, perhaps, is still better, by ether vibrations—a method now generally adopted. I may give the following extracts:

"In the earlier discussions of the chemical effects of light, the different regions of the spectrum were marked out by the designations of the different colored rays, and effects were described as taking place in the red, or yellow, or violet regions respectively. An improved plan was proposed by Sir J. Herschel, and followed by him in his various writings. It consists essentially in dividing the space which exists between the red and yellow ray as insulated by cobalt blue glass into 13.30 parts, taking the centre of the yellow ray as the zero point, and continuing the divisions equally into the more and less refrangible regions.

"Over these methods the use of the fixed lines possesses very great advantages, inasmuch as we make reference to actually visible points existing in the spectrum.

"It has been stated that the deviations of the different fixed lines in the diffraction spectrum are proportional to the lengths of the undulations which they respectively represent. By designating the different points of the spectrum by their wave lengths, the subdivision may be carried to any degree of minuteness, the measures of one author will compare with those of another, and the different phenomena of chemical changes occurring through the agency of light become at once allied to a multitude of other optical results. If it were necessary, by a very

simple arithmetical process we could determine the number of vibrations executed by a ray bringing about a given decomposition in billionths of a second. The fixed lines used in this way enable us at once to divide the diffraction spectrum into any number of

parts, and, by comparing wave lengths and the velocity of light, to indicate effects either in space or in time."

The diffraction spectrum, as we have seen, differs strikingly from the prismatic in the arrangement of its colored spaces. In the latter, the less refrangible parts are compressed more and more in proportion as their refrangibility is less. Now there is reason to believe that in the former the colored spaces are equally warm, though so feeble is the calorific effect that all attempts at the direct measurement of the heat have proved unsatisfactory. I first made such attempts with very delicate thermo-electric apparatus, but could not obtain sufficiently striking results. Admitting, however, that every ray, irrespective of its color, in the act of extinction will generate the same amount of heat, it necessarily follows that in the prismatic spectrum the heat should appear to increase steadily from the more to the less refrangible end, because in it the compression of the colored spaces is becoming greater and greater, and this is what is actually observed.

These considerations respecting the distribution of heat in the spectrum lead naturally to the examination of a much more comprehensive problem—indeed, one of the most important problems that science presents—viz., the constitution of the sunbeam.

Until the time of Newton it was universally admitted that light is a pure undecomposable elementary principle. He showed that this conclusion must be modified. No one, except Leibnitz, in those days, and no one for a long time subsequently, discerned the ominous import of the discoveries of this Prince of geometers. Of his detection of the origin of Kepler's laws, and its necessary consequence of the mode in which the government of the universe is conducted, I have nothing here to say. Let us see how it was with his discoveries concerning light.

His interpretation of the experiment he made in the "dark chamber" was this, that light is not an undecomposable element, as was at that time supposed, but that in reality it consists of not fewer than seven different constituents, recognizable by their color. These, if mixed in any manner together, whether by grinding tinted pigments or revolving party-colored sectors, or converging the spectrum through a convex

lens, would, by their union, produce white light. His felicitous experiments with the two reversed prisms silenced the carping critics of that day, who had declared that the colored tints with which he was working had no such origin as he affirmed—in difference of refrangibility—but were analogous to the iridescent play of light on a pigeon's breast, or the more gorgeous lustre of a peacock's tail. It cost only a short struggle, and the theory of the composite nature of light made good its ground.

When, therefore, Herschel, in his examination of the sun's surface through colored glasses, came to the conclusion that the heat emitted by the sun is essentially and intrinsically distinct from the light, and that these elements may be parted from each other by refraction, he did no more than develop the principle that had been announced by Newton; and when, at a later period, Melloni extended these researches, and it was universally admitted that there are heat rays which, like light rays, have various refrangibilities, this conclusion was quite accordant with Newton's results. Heat was considered as existing in the solar beam independent and irrespective of light. In fact, the one might be easily separated from the other.

When, again, the Swedish chemist Scheele, investigating the chemical action of light, showed that there are rays invisible to the eye, and of greater refrangibility than the violet, which can produce the decomposition of certain compounds of silver, these were considered to be an additional element, and passed under the designation of chemical rays, deoxidizing rays, etc. Treated of in the works of physics of those times as imponderable bodies, there seemed to be no necessary limit to their number. More than half a hundred ponderable substances were known. Why, then, should there not be as many of these imponderable ones? This was the view universally entertained at the time I began the experimental study of radiations. For such as are concerned in producing chemical changes I suggested a special designation, which, however, did not find acceptance: the inappropriate and unmeaning appellation, actinic rays, was preferred.

Meantime, however, the undulatory theory of light had been steadily making its way. It was exhibiting all the aspects of a great physical truth, in not only rendering an explanation of known facts, but also in predicting the occurrence of other facts previously unknown. Persons who were in the front of the scientific movement in this direction had thus their attention forcibly drawn to a contemplation of the whole subject from this new point of view. They very soon perceived that from it bonds of interconnection between facts hitherto sup-

posed to be isolated might be discerned; things that were fragmentary and confused spontaneously fell into an orderly arrangement.

While the theory of optics was making this great advance, another important science, physiology, was presenting a similar development. It was casting off the Vital Force of the older medical authors, and acknowledging the dominion of chemical and physical forces. It had become plain that the interpretation of many phenomena, as hitherto received, must be changed.

We may apparently have heat without light, and light without heat. In the darkest room we can not perceive vessels filled with boiling water, yet the warmth we experience on approaching them assures us that they are emitting radiations. Is not this heat without light? If we stand in the rays of the full moon, we can not detect any increase of temperature. Is this not light without heat? It is true that in this latter instance we are mistaken as to the fact; but overlooking that—for the heat to be detected in the moonbeams requires the most sensitive apparatus—do not such observations assure us that heat and light are independent of each other, physical principles having an existence separate from each other?

Such were some of the arguments on which was sustained the hypothesis of the intrinsic difference of light and heat. In this, no account was taken of the optical functions of the eye. Qualities were incorrectly attributed to radiations which, in truth, were due to peculiarities in the organ of vision.

The great service which the diffraction spectrum has rendered to science is the abolishment of all these imaginary independent existences—heat, light, actinism, etc.—and the substitution for them of the simpler conception of vibratory motions in the ether. The only difference existing among the radiations that issue from a grating, in the manner we have been describing, is in their wave lengths, or, what comes to the same thing, in their times of vibration. The diversity of effects produced depends on the quality of the surface on which they fall. If on a dark surface, and the more so in proportion to its blackness, they engender heat; if on the retina, they are interpreted by the mind as light; if on photographic preparations, they produce decomposition, designated *actinic effects*.

Heat, light, actinism, are, then, not natural principles existing independently of each other, but effects arising in bodies from the reception of motions in the ether, motions which differ from each other in their rapidity. Of those that the eye can take cognizance of, the most rapid impart to the mind the sensation of violet light, the slowest,

the sensation of red, and intermediate ones, the intermediate optical tints. Colors, like light itself, are nothing existing exteriorly. They are merely mental interpretations of modes of motion in the ether, and in this they represent musical sounds, which exist only as interpretations by the mind of waves in the air.

I have not hesitated to include the present paper in this series, for, apart from the train of investigation and thought it has presented in its narrative of the researches

of so many eminent philosophers, it also furnishes us this impressive and instructive lesson, that the most simple natural facts, if studied by the methods of modern science, may lead to the most unexpected, the most surprising results. The shadow of an eyelash or of a pin, so considered by Newton, Huyghens, Herschel, Young, Fresnel, Fraunhofer, has led to a vast extension of human knowledge, and carried us onward to unexpected conclusions as to the operation of the human mind itself.

THE FLYING PROA.

STRICTLY speaking, a sail-boat is a craft propelled by any sort or number of sails. Usually, however, the term sail-boat is restricted to an open pleasure-boat, carrying a single sail, and rigged after the fashion called, for some inscrutable reason, the cat rig. When a pleasure-boat is large enough to have a cabin, or carries a jib and main-sail, she is usually honored with the name of yacht, and is thus promoted above the rank of sail-boat.

The cat-boat is the typical sail-boat of American waters, for the cat rig is scarcely known in Europe. In length it ranges all the way from twelve to forty feet, but the great majority of cat-boats are over fifteen and under twenty-five feet long. The cat-boat swarms all over our harbors, rivers, and small lakes, and annually drowns a frightful aggregate of men, women, and boys. Fortunately we have neither tigers nor deadly snakes along the banks of the Hudson, the Sound, or the New Jersey and Long Island bays; but the ravages of the New York, New Jersey, and Connecticut cat-boats make quite a respectable appearance even in comparison with the terrible statistics of snake bites and tiger dinners in India. The best variety of cat-boat is a shallow, saucer-like boat, drawing not more than a foot or eighteen inches of water when the centre-board is up, and decked over for about a third or a half of the distance from bow to stern. The single mast is stepped close to the stem, and the sail is stretched by means of a long boom and a shorter gaff. It can be easily handled by one person, and its management can be readily learned. In the estimation of persons familiar with boat-

ing, who do not desire to die early, the cat-boat has three serious faults—a liability to capsize, to be swamped, and to sink when a sufficiently large hole is made in her. The last fault she possesses in common with all other civilized vessels, but to the first two she is peculiarly prone.

When a cat-boat is sailing with the wind abeam, or forward of the beam, and is mau-

CAT-BOAT.

aged by a competent and careful man, she is as safe as any other small sailing vessel. Such a man will see the approach of a fresh gust of wind before it reaches him, and will be prepared to meet it. He will have his peak halyards led aft to a cleat within his reach as he stands at the helm, and he will thus be able to instantly slack away the peak if the gust is a violent one. If this is not necessary, he will luff the boat just before the gust strikes the sail, and thus, by causing the sail to present a smaller angle

to the direction of the wind, will diminish the effect of the latter upon the boat. In no circumstances will he commit the error of letting go the sheet. This is the favorite manœuvre of the man who sails a cat-boat by the light of nature. He thereby incurs the risk that the end of the boom will be driven under the water, and will act as a lever to force the boat's head off from the wind, and so enable a capsize to be easily and surely achieved. The cardinal principle of cat-boat sailing is to "luff her up when it breezes," but it is constantly ignored by hundreds of men who regard themselves as fully competent to manage a boat.

It follows that safety from capsizing in a cat-boat sailing on the wind may be assured by care and intelligence. The difficulty is that not one in a hundred of those who undertake to manage cat-boats possesses both these qualities. Often the man who knows precisely what he ought to do neglects to do it. He lets a squall creep down upon him unseen while he is talking with a fair passenger, and jams his helm down when it is too late. He neglects to have his peak halyards within his reach, or coiled down so that the rope will run smoothly through the blocks. Thus, when the moment comes to let go the peak, either he can not reach the halyards without letting go the helm, or the tangled rope refuses to do its duty. Carelessness probably leads to as many capsizes as incompetency, and even the thoroughly accomplished and experienced sailor is often too self-confident to be careful.

When running before the wind, the utmost care will sometimes be unavailing to prevent an open cat-boat from swamping as she wallows in a heavy sea. The chief danger, however, to which a sail-boat with a free wind is exposed is that of unexpected jibing. Either the wind suddenly veers a little, or the helmsman steers wildly, and the wind takes the sail aback. Instantly the boom flies to the other side of the boat, and is brought up by the sheet with a shock that either parts the rope, breaks the boom,

or capsizes the boat. Ordinarily jibing can be prevented by careful management, but occasionally a sudden shifting of the wind will lead to an equally sudden jibing, in

FEEJEE DOUBLE CANOE.

spite of the most careful helmsman. There is one source of danger to which a cat-boat when running dead before a fresh breeze must necessarily be exposed. It is that of rolling the end of the boom under. A sloop, if the necessity occurs, can scud under her jib alone; but the cat-boat, having but one sail, must keep that set in all circumstances in which a sail is needed. Now when the boom is at right angles to the line of the keel, as it is when the wind is directly astern, the rolling of the boat is very apt to dip the boom into the water. When it is dipped to a certain depth, a capsize becomes inevitable. No seamanship can do away with this danger. It springs from the inherent viciousness of the cat rig, and no care or foresight can provide against it. Occasionally the boom, instead of rolling under, "kicks up," as the phrase runs, and is wrapped close to the mast by the sail. The boatman, if he is a sailor, can usually extricate himself from a difficulty of this kind by one or another expedient; but if he is merely an awkward amateur, as is usually the case, he abandons himself to de-

spair, and gloomily wonders where his body will be found, and whether it will be swollen to an unrecognizable extent.

In addition to these methods of drowning its passengers, the cat-boat, like all other vessels provided with low-swinging booms, contrives to annually knock a large quantity of people overboard. Not very long ago the Rev. Mr. S——, residing near a bay on the Connecticut coast eligible for sailing purposes, rashly took his own and a few assorted children belonging to his parishioners out sailing in his newly purchased cat-boat. A pleasant breeze, scarcely strong enough to be called "fresh," was blowing, and the good clergyman, confident that there was no possible danger, went on explaining the probable rig of the Ark, until the boat suddenly jibed. The boom and the sheet were both new, and the wind was not strong enough to carry any thing away or to capsize the boat. The children's heads happened, however, to be in the path of the swinging boom, and it reaped the astonished small boys at a breath, and the girls who sat between, like a blunt but determined sickle. Most of them were successfully picked up; but two small boys were missing when the boat reached the land, and their parents, who seemed to attach a good deal of value to them, never quite overlooked the clergyman's conduct, and at the next donation party expressed their feelings in dried beans in a painfully unmistakable way. Usually persons who are knocked overboard by a boom, and know how to swim, are picked up again in a damp but living condition. When, however, the boom hits a skull hard enough to fracture it, the victim rarely takes sufficient interest in worldly affairs to try to keep himself afloat.

The cat-boat is, then, always dangerous when in careless or incompetent hands, and sometimes unavoidably dangerous when managed by the best of sailors. It is, however, the best and safest sail-boat which civilized boat-builders have produced, and we can not expect any thing safer from them. If a boat-builder is asked to construct a boat which shall be not only fast, but absolutely safe in all contingencies, which can neither capsize, swamp, nor sink, no matter if she strikes on the sharpest rocks in Hell Gate, he will frankly confess that he can not do it. Nevertheless, such a boat can be built, and with it two cool-headed girls can outsail the *Sappho* or the *Columbia* without risking any danger more serious than that of an occasional sprinkling of spray.

The hollow log and the solid log are the germs from which two widely distinct types of vessels have been developed—those in which, and those on which, the crew is carried. We have developed the hollow log

through all the various stages that separate the canoe and the Cunarder, but have abandoned the solid log after having converted it into the cumbrous lumber raft. The South-sea Islanders, on the other hand, have developed the solid-log idea until the result is seen in their double war canoes—vessels that, although wonderfully swift and safe, are virtually nothing more than two parallel logs joined together with a platform, on which a mast is planted. The Feejee double canoe is not, however, the consummate flower of barbarian boat-building genius. It has been surpassed by the flying proa of the Ladrone Islands—a craft that combines to some extent both the hollow and the solid log ideas, and which merits a brief description here.

The hull of the flying proa exhibits on one side the graceful lines of a well-modeled boat, but on the other side it is perfectly flat. Were an ordinary sail-boat to be cut in two along the keel, and each half to be boarded up perpendicularly, either would present a rude idea of the model of the proa. Each end of the proa is precisely alike, and as the mast is placed exactly in the middle, the craft will sail equally well with either end first. Across the deck run stout bamboo poles, which project beyond the rounded side of the proa, and are fastened at their extremities to a log of wood placed parallel with the boat, and fashioned so as to offer the slightest practicable resistance to the water. The weight of this log or outrigger acts as a counterpoise to the force of the wind, since, by the peculiar manner in which the proa is sailed, the log is always on the windward side. Thus, although the proa is excessively long and narrow, it can never capsize, the outrigger answering the same purpose in this respect which the Feejeean accomplishes by using a double canoe.

The mast, although placed exactly halfway between the ends of the boat, stands in the bilge close to the gunwale, where it is fastened to the middle beam of the outrigger. The sail is a lateen, triangular in shape, but much wider at the foot and less lofty in proportion than are most lateen-sails. It does not seem large in comparison with the length of the proa, but in view of the extreme narrowness of the hull, and its want of stability apart from the outrigger, it is really an enormous sail. The fore end of the yard fits into a socket at the end of the boat, and the foot of the sail is laced to a boom. It is thus capable of being trimmed as flat as a board, and as it is reefed by simply rolling the boom until the desired amount of sail is wrapped around it, the shape of the sail always remains the same.

In the accompanying cuts, Fig. 1 represents the proa with her sail set, as she appears when viewed from the leeward. Fig. 2 is a view of the proa as she would appear

to a person directly in her path. Fig. 3 is a plan of the whole craft, A B being the lee side of the proa; C D, the windward side; E F G H, the frame of bamboo poles connecting the hull with the outrigger; K L, the boat-shaped outrigger; M N, braces to steady the frame; R S, a thin plank placed to windward to prevent the proa from shipping water, and for a seat for the man who bales out the water; T, the position of the mast. The mast itself is supported (Fig. 2) by the shore P, and the shroud Q, and by two stays running from the mast-head to the stem and stern respectively.

As has been said, the proa is sailed with either end first, but the outrigger is always

needs only to have these faults removed to meet the most exacting demand. This is not a difficult problem; and, indeed, safety against swamping and sinking, as well as capsizing, has been secured by the invention of the *Nonpareil* life-raft, though at the sacrifice of speed and of the comfort of the crew. The latter awkward-looking craft, which crossed the Atlantic in forty-three days, with a crew of three men, consisted of three parallel tubes filled with air and strongly connected by a platform. Of course it could neither capsize nor sink, but it was a raft rather than a boat, and certainly could not be classed as a pleasure craft.

kept on the windward side. The flat side of the hull being thus always the lee side, acts as a keel or centre-board, but with more effect than either. In fact, the proa is said to make scarcely any perceptible leeway. When beating against a head-wind the proa never tacks. She is merely kept away until her stern approaches the wind, when the yard is swung around, and what was the stern suddenly becomes the bow. It is credibly asserted that this product of barbarian genius often attains a speed of twenty miles, and it is certain that not only is the proa the fastest sailing boat in existence, but it will sail nearer the wind than any vessel known to European or American sailors.

Here we have a craft which has two of the qualities of the ideal perfect sail-boat—great speed, and absolute safety against capsizing. Still, a flying proa may be swamped, and is capable of sinking. It

Suppose we take two tubes of galvanized iron, flat on one side like the hull of the flying proa, and nicely modeled on the other. If these tubes are placed with their flat sides toward each other and connected with a platform, we should secure all the advantages which the Ladrone Islander obtains by his device of a flat-sided hull and an outrigger, while we should also avoid the faults of the flying proa. The tubes, if divided by water-tight bulk-heads into four sections each, would retain their buoyancy even if half of each were crushed in by sunken rocks. The flat side of the windward boat would always act as a centre-board, and the

craft could tack like a civilized boat, instead of having to adopt the savage expedient of sailing with either end first. The platform would be sufficiently high out of the water to be always dry, especially if protected by a low bulwark; and should a sea be shipped, the water would immediate-

ly run off without doing any harm. As to capsizing such a craft, there is no variety of wind known to the Weather Bureau or dreamed of by Professor Tice which could do it. Long before one tube could be sunk and the other lifted out of water, the sail would be blown to atoms and the mast carried away. If care were taken in the modeling of the tubes and in the proper rigging of the boat, there is no reason why she should not equal in speed the flying proa.

Double boats, or catamarans, as our boat-builders call them, have often been built in this country, but they have proved intolerably slow. The reason would be plain enough to a Ladrone Islander. In all cases two complete boat hulls have been used, instead of two half sections of a boat. It is apparent that in such a craft the distance between the hulls at the stem-post of each is much greater than it is at the beam. Hence, when the craft is in motion, the water between the two bows is compressed into a continually narrowing space until it reaches the beam, after which it passes astern without any further obstacle. Of course speed is out of the question in such a craft, since the faster it moves, the greater becomes the resistance offered by the wedge-shaped mass of water heaped up between the two bows. It is no wonder that catamarans built after this fashion have been unpopular; but what is utterly unaccountable is the fact that a distinguished English ship-builder, who designed the twin steamer *Castalia*, committed the error of making the parallel hulls precisely like the hulls of ordinary steamers, and thus rendered it inevitable that the *Castalia* should be a slow boat in spite of her enormous engine-power.

There is no man more conservative than the average boat-builder, and it would doubtless outrage all the holier feelings of his nature to ask him to build a civilized modification of a flying proa. His aid, however, is not necessary at the outset, provided iron instead of wood is used as the material for the twin hulls. Of course there is a loss of buoyancy in using iron, but it has so many

advantages over wood that this one defect may be disregarded. Any moderately intelligent worker in iron, if provided with a small wooden model of the proposed hulls, could easily copy them in galvanized sheet-iron.

THE MODIFIED PROA.

The upper side of each hull should be flat, and at right angles to the flat or inner side, and a midship section of each hull should be very nearly a segment of a circle. If galvanized iron one-thirty-second of an inch in thickness is used, and each hull is sixteen feet long, eighteen inches wide on the upper side, and eighteen deep on the flat side at its midship section, the two together, when in the water, will sustain, in addition to their own weight, more than 3000 pounds.

Placing these hulls five feet apart, and connecting them by four transverse beams, four inches square, we are ready to lay the deck planks, which should be as light as is consistent with strength. The deck should be semicircular in shape at the bow and stern, and though it should reach nearly to the stern of each hull, it should leave about two feet of the forward end of each hull uncovered. This would make the deck eight feet wide at its widest part, and about thirteen feet six inches in extreme length, and would furnish fully three times the available space for passengers which is furnished by a cat-boat sixteen feet long.

High bulwarks would not only be unnecessary, but they would present too great a surface to the wind. At the bow, bulwarks about a foot in height, and flaring outward at an angle of, say, seventy degrees with the deck, would be useful as a protection against spray when beating to windward, but they should gradually decrease in height, as they run aft, to not over four inches, and should then increase again at the stern to nearly the same height as at the bow. A light rope, supported by stanchions, and running around the deck at the height of two feet, would be entirely sufficient to prevent unwary passengers from stepping overboard. The steadiness of the craft would permit the use of camp-chairs as seats, and these would have the further advantage of being movable whenever the weight of the passengers should be needed on the windward side in order to trim the boat.

Of course the simplest way in which to rig the craft would be to copy the rig of the cat-boat. But the graceful lateen-sail, which would be dangerous if used on an ordinary sail-boat, would be perfectly safe when used on a boat which no amount of carelessness can capsize. In order to insure plenty of head-room on deck, the sail would have to be narrower in proportion to its length than is the lateen of the Mediterranean, and would thus approach somewhat to the pattern of the sail of a Feejee double canoe. If the lateen rig is adopted, the mast would be stepped further aft than is necessary where the cat rig is used. It must be conceded that the chief recommendation of the lateen-sail is its picturesque appearance, and that for all practical purposes the boom-and-gaff sail used by all our fore-and-aft vessels is decidedly superior. Two rudders would be needed, but the two could easily be connected with a single tiller. Undoubtedly the boat could be more easily steered with a long oar than with rudders, but in that case the helmsman would lose half the pleasure of steering.

The builder of such a craft must be prepared to meet the gibes of conservative mariners and small boys, who will at first denounce it as a ludicrously ugly affair. There is no reason, however, why it should be ugly, provided the builder does not commit the mistake of trying to make it resemble the conventional sail-boat. Let him conceive of the deck as a floating sea-shell, and shape the curve of his bulwarks in accordance with this idea. The lateen-rigged proa is far prettier than the cat-boat.

The advantages of the modified proa are not limited to its speed and safety. It needs no ballast. Its deck is so spacious that its passengers need never suffer from the misery which is entailed by sitting for hours under a hot sun in the confined space of a cat-boat's cockpit. At night the proa can

be anchored and a tent pitched on the deck, under which the coolness and comfort that are sought in vain in the state-room of a yacht can always be had. The deck and the connecting beams can be put together with bolts, so that the craft can easily be taken apart and sent overland by railroad. As the proa is proof against any effort to capsize her, the sail can always be hoisted up so far above the deck as to enable the boom to clear the heads of the passengers. To counterbalance these advantages there is but a single fault. The craft would probably be slow in tacking, and might occasionally need the aid of an oar to put her about. The rigger should bear this in mind when deciding upon the dimensions and pattern of the sail.

Of course the proa is an outlandish craft, but she is safe, and she is incomparably fast. She does not look like the conventional boat, but it costs only about half as much to build her. Can you cook, eat, and sleep comfortably on board a sixteen-foot cat-boat? or can you send her a hundred miles overland without paying her worth in freight? Yet with a sixteen-foot proa you can do all these things, and can, moreover, intrust her to a consumptive theological student with the utmost confidence that she will resist all his attempts at drowning himself.

THE FAIRIES' TABLE-CLOTH.

HERE is the fairies' table, vined
Over with lichen'd buhl-work bright;
Here is the cloth they left behind,
After their feast was done last night.

Never such napery met my eyes;
Never such cobweb woof I've found;
Dotted with dew-drops damask-wise,
Bordered with seed-pearl all around.

Service of creamiest lily-ware;
Spoons of gold from the tulip's heart;
Silver épergnes of callas rare;
Napkins fringed by the gentian's art.

Wine from the spice-wood's vintage, poured
Out of the bubble's Venice glass;
Bread from the pollen of wild peas stored;
Cates from the buds of sassafras;

Meats from the hazels: sweets and sours
Fashioned alone for fairy lips,
Out of the cores of pungent flowers,
Out of the purple haws and hips.

Fruits from the winter-green, alder, grape;
Barberries red with ruby glows;
Wildings of elfin size and shape,
Folded in leaves of brier-rose.

Satiny toad-stools ranged as chairs;
Moon mid-sky for a chandelier;
Crickets and tree-frogs crooning airs
Up in the green orchestra near.

Ah, what a supper it must have been!
Bountiful, zested, racy, rare;
Ah, if I only had fairy kin!
Ah, if I only had been there!

THE OLD SOUTH MEETING-HOUSE.

[The congregation which held the "Old South Meeting-House," in Boston, having preferred to worship elsewhere, the venerable building itself has been secured by a public association as a monument of the first moments of our history. It is proposed to make there a Museum and Gallery which may illustrate the history of the past, and, if possible, to circulate every where from that centre such words of patriotic and historical information as may be of use in the education of the whole land to know how the nation was born, and what are the principles of our institutions.]

The Old South Meeting-House stands in the very heart of Boston, on the site of Governor John Winthrop's house or garden; and in this very building Sam Adams made his most eager appeals to the people. Massachusetts has sent to Washington the statues of Winthrop and Adams, because they are the representative men of her history. She is fortunate in being able to make at home a historical monument of the Old South Meeting-House, which has been well called "the homestead of one and the forum of the other."

In the following lines an attempt is made to describe the Gallery which, when the building is dedicated to the patriotic education of the nation, may be formed there.]

To hide the time stains on our wall,
Let every tattered banner fall!
The Bourbon lilies, green and old,
That flaunted once, in burnished gold;
The oriflamme of France, that fell
That day when sunburned Pepperell
His shotted salvos fired so well,
The Fleur de Lys trailed sulky down,
And Louis-burg was George's town.
The Bourbon yields it, in despair,
To Saxon arm and Pilgrim prayer.

Hang there the Lion and the Tower,
The trophies of an earlier hour,
Pale emblems of Castilian pride,
That shrouded Winslow when he died
Beneath Jamaica's palm.

Hang there, and there, the dusty rags
Which once were jaunty battle flags,
And, for a week, in triumph vain,
Gay flaunted over blue Champlain,
Gayly had circled half the world,
Until they drooped, disgraced and furled,

That day the Hampshire line
Stood to its arms at dress parade,
Beneath the Stars and Stripes arrayed,
And Massachusetts Pine,
To see the great atonement made
By Riedesel and Burgoyne.

Eagles which Cæsar's hand had fed,
Banners which Charlemagne had led

A thousand years before,
A dozing empire meanly gave
To be the eagles of a slave,
And let the mean Elector wave
Those banners on our shore.

The mean Elector basely sold
Eagle and flag for George's gold;

And, in the storm of war,
In crash of battle, thick and dark,
Beneath the rifle-shot of Stark,
The war-worn staff, the crest of gold,
The scutcheon proud and storied fold,
In surges of defeat were rolled,
So even Roman banners fall
To screen the time stains on our wall!

Beneath the war flag's faded fold
I see our sovereigns of old

On magic canvas there.
The tired face of "baby Charles"
Looks sadly down from Pilgrim walls,
Half pride and half despair,
Doubtful to flatter or to strike,
To cozen or to dare.
His steel-clad charger he bestrides
As if to smite the Ironsides
When Rupert with his squadron rides;
Yet such his gloomy brow and eye,
You wonder if he will not try
Once more the magic of a lie
To lift him from his care.

Hold still your truncheon! If it moves,
The ire of Cromwell's rage it braves!
For the next picture shows
The grim Protector on his steed,
Ready to pray, to strike, to lead,
Dare all for England, which he saves,
New England, which he loves.

These are Vandycks. 'Tis Kneller there
Has pictured a more peaceful pair:
There Orange gives his last command,
The charter gives to Mather's hand;
And, blooming there, the queenly she
Who takes, "now counsel, and now tea,"
Confounding Blenheim and Bohea,
Careless of war's alarm.
Yet, as of old the virgin Queen,
When armed for victory, might press
The smoky fire-lock of "Brown Bess,"
So Anna, in a fond caress,
Rests on a black "Queen's arm."

Beneath those forms another band,
Silent but eloquent, shall stand.
There is no uttered voice nor speech
As still of liberty they teach;
No language and no sound is heard,
Yet still the everlasting word
Goes forth to thrill the land.
Story and Greenough shall compel
The silent marble forms to tell
The lesson that they told so well—
Lesson of Fate and Awe;
Franklin still point the common place
Of Liberty and Law.
Adams shall look in Otis' face,
Blazing with freedom's soul,
And Molyneux see Hancock trace
The fatal word which frees a race,
There, in New England's well-earned place,
The head of freedom's roll.

These are not all. The past is gone,
But other victories shall be won,
For which the time-worn tale we read
Is but the sowing of the seed.
The harvest shall be gathered when
Our children's children meet again
Upon this time-worn floor;
When ruddy drops flush living cheek,
And tribunes of the people speak
As living man can speak to living men;
When future Adamses conspire,
When other Danas feed the fire,
Each grandson worthy of his sire;
When other Phillipses shall tell
Again the tale *he* tells so well;
When other Minots shall record
The victories of some other Ward,

And other Prescotts tell the story
 Of other Warrens' death and glory;
 When, in some crisis of the land,
 Some other Quincy takes the stand,
 To teach, to quicken, to command,
 To speak with prophet's power
 Of Liberty and Law combined,
 Of Justice close with Mercy joined,
 United in one heart and mind:
 That talisman of victory find
 In which our laurels all are twined;
 And, for one struggle more,
 Forget our things which lie behind
 And reach to those before!

BELL'S MATCH-MAKING.

"MY DEAR FLORA," wrote Miss Raymond,—*"It is a long time since we have met. Why can't you pack your trunk, and make up your mind to spend the summer with me in this green and quiet corner of the earth? You shall diet upon locusts and wild honey, if such be your pleasure; you shall put in an appearance at parish picnics, or sit in the arbor and embroider while somebody reads Tennyson aloud—in short, you shall do as you please, if you will please to come to your rural friend"* BELL."

Miss Raymond regarded it as a wise and far-seeing policy that she had forborne to mention the name of the Rev. Clarence Gascoigne—a poor but promising young clergyman recently settled over the parish of Haphazard, whose welfare she had chiefly in view in issuing this invitation to "dear Flora," who was nothing less than an heiress and a beauty. Miss Raymond herself, being neither, naturally set a greater value upon these things than they deserved, and devoutly believed that Flora would carry all before her at her own sweet will. She remembered, when they had been at Madame Buhl's finishing school together—before adversity had visited the Raymonds' roof—that Flora had been the cynosure of all the neighboring eyes at Dr. Creed's theological seminary, that she had been deluged with valentines, surfeited with *bonbons*, and embalmed in sonnet and song in the poet's corner of the local daily. But apparently these things had not availed. Miss Flora had already survived several seasons, and was yet Miss Flora, and untrammelled. Whether she had flirted too hard, her heart had remained untouched, or she had never inspired her lovers with any thing stronger than a passing fancy, nobody but Flora knew. Miss Raymond's family consisted merely of herself and a widowed aunt; and as her income was small, she usually filled the roomy old homestead with summer boarders. But since the new rector of the parish had taken up his abode under her roof-tree, and Aunt Milly was in somewhat failing health, she had decided not to add to her cares, but to

her pleasures, in begging Flora to spend the season at Haphazard. And Flora was nothing loath. She stepped from the lumbering old stage late on one summer afternoon, in the jauntiest of travelling toilets, with the most killing of hats perched upon her shapely head—a very bewitching picture of a girl of the period, the soft fluffy curls upon her white forehead, the dark eyes shining with mischief, the wild rose blushing upon cheek and chin, and a ready smile about the mobile lips. Bell felt suddenly old and faded and dowdy beside her, and upbraided herself smartly for the sensation. She went up to her guest's room with her, threw open the blinds, pointed out the views, and helped her unpack.

"I do hope you won't find it stupid here, Flora," she said; "that time will not hang heavy upon your hands. Society here is rather chaotic, to be sure, but—"

"I suppose there isn't such an article as a gentleman within ten miles," yawned Flora.

"Well, they are not as plenty as I could wish, for your sake, I confess. We are always living in hopes that the master of Pine Hill will return and endanger our monotony—you can see the towers of the mansion from this window, there, behind that belt of pines; but he prefers the gay world. And then there's our rector; *he* is very good company."

"Oh, spare us! I had theology enough, thank you, at Madame Buhl's. If there's *any thing* I detest, it's a— Say, Bell, who is that splendid apparition coming in at the gate?"

"That?" laughed Bell—"that is the afore-said rector."

"Is he coming to give you ghostly counsel? I shall be getting a change of heart, depend on't."

"He's coming home to tea. He boards here."

"*'There is a divinity,'*" quoted Flora. "I thought, to be sure, it was no less than the master of Pine Hill coming to his estates just in the nick of time. How long has his Reverence been here, may I ask?"

"Only three months."

"Well, I wonder you haven't fallen in love."

"I? Where would be the good?"

"Who ever stops to think of that?"

"At least one must have a little encouragement to begin with."

"And hasn't he given you a particle? You just hand him over to *my* tender mercies."

"You sha'n't flirt with him, Flora; he's too good and innocent; he would think you in earnest."

"*'Sha'n't'* is in the imperative mood, I believe. Are you the guardian of his young affections?"

And then they descended to the tea table, and Flora and Clarence Gascoigne shook hands and chatted familiarly—nobody could resist chatting familiarly with Flora after the first half minute—about his cousins, the Gascoignes of Newport, and a dozen people, of whom Miss Raymond had never heard, and of whom never to have heard seemed suddenly to prove her a person of the least consequence. After tea the trio strolled in the garden, Flora leading the conversation, and waking the echoes with her quick laughter; and they sat a while on the rustic bench beside the syringa bushes, and Flora sang snatches from the operas and spiritual hymns; and Bell marked that when she dropped out of catch or chorus, nobody seemed to miss her, and presently she stole away to look after her housekeeping, congratulating herself that every thing promised well for her scheme. Flora was perhaps a trifle giddy and girlish for a clergyman's wife, but she would outlive all that; and what an excellent thing it would be for Mr. Gascoigne, whose abilities would never have fair play if he married any poor girl about Haphazard, and lived from hand to mouth, so to speak, with none of the opportunities which money could offer; and as for Flora, she might bless her stars if he preferred her, if he had no inconvenient scruples about marrying a rich woman.

The summer weather was fine at Haphazard, and if Mr. Gascoigne begged the ladies to visit some poor or invalid parishioner in his company, it usually ended by Flora going with him alone, Bell having found some urgent duty to detain her at home at the last minute; and Flora developed quite a talent for cheering the sick-room and dispensing luxuries to the needy: it was a *rôle* of which she relished the novelty amazingly.

"You were plainly intended for a clergyman's wife," blundered Mr. Gascoigne, in a moment of grateful enthusiasm; and then he colored, and added, hastily, "The lame, halt, and blind are all singing your praises."

"What a discord it must be!" returned Flora. "I think I should prefer a solo."

The claims of the parish, however, were not so exacting but he could devote some leisure to the poets, sitting in the vine-covered arbor, while Bell and Flora worked and listened—except when Bell remembered she had omitted to leave orders for the grocer, or had neglected some important household affair, and excused herself for a long half hour, begging them to go on with the reading. And when she returned, she was always pleased to find that the book had been closed for the nonce. If he had not been reading, then of course he had been doing what he liked better. And he would say, "We have been waiting for you, Miss Bell"—he had fallen into the habit of calling her "Miss Bell" during these familiar *séances*.

"I sha'n't dare to run away, if I am going to spoil your pleasure so," she replied.

"You certainly do spoil it when you leave us," he would gallantly retort.

If they went for an afternoon's picnic to the top of Chrome Cliff, with their supper packed in a hamper, Bell fell to sketching a bend of the river, with the willows dipping above it and swallows skimming low, and Flora and Mr. Gascoigne were naturally left to their own devices. If they went out for an evening's entertainment—which even Haphazard afforded at times when summer guests were plenty—Bell remembered the latch-key as soon as they were beyond the gate, or she had left a window open where burglars and showers might enter, or she never failed of some valid excuse for falling behind, for refusing Mr. Gascoigne's arm—either both hands were necessary to keep her skirts from the mud, or the country sidewalk was too narrow for three abreast. And yet there was nothing obvious or awkward in Miss Raymond's scheming. It all came about as naturally as if fore-ordained; and if Mr. Gascoigne was sometimes a little vexed that he could not be trusted to find the latch-key, close the window, or fetch the umbrella, Flora would say, "It's Bell's way; she was just so at Madame Buhl's—always *would* wait upon herself."

It had never been Bell's way, however, to linger in the vestibule after church; but now she found it convenient to ask old Mrs. Ross about her rheumatism, and Martha Meeks about her grandson fishing at the Labrador. And by that time the Reverend Clarence had put off the gown and made his way to the church door, where Flora welcomed him; and Bell nodded and begged they would walk on, and let her overtake them: she must speak to the sexton about his sick child, or see the treasurer of the Mite Society—only she never did overtake them. The treasurer had proved garrulous, and the sexton had set his heart upon showing her the head-stone he had got up to his first wife. If she found them sitting alone in the embrasure of the open window, studying the constellations, she moved softly away. Who could tell?—it might be the decisive moment.

It so happened that just at this time Mrs. Raymond fell ill. Flora proposed going home, but Bell stoutly vetoed the proposition. "It will be so lonesome for Mr. Gascoigne," she said. "And Aunt Milly will be up again soon. No; do you stay, and pour the tea at table, and play at house-keeping, and make it a little like home for the poor fellow."

"Seems to me you are very anxious about his welfare," said Flora, but staid as she was bidden, poured his tea, whiled away his leisure hours, beat him at chess, visited his sick, listened to his views, filled the place

of the absent soprano in his choir, and borrowed his old sermons for private reading, while Bell spent her time administering hourly doses, concocting gruels and dainties to tempt the appetite, and waiting in a darkened room by day, after broken nights. Perhaps it was the effect of overtaxed nerves and depressed spirits, or perhaps Miss Raymond had misunderstood her interest in Mr. Gascoigne, but as she left her patient dozing one night, and paused a moment, leaning out the hall window to commune with the evening star and the last tender effulgence of sunset, the sight of Flora and Mr. Gascoigne pelting each other with roses in the garden below smote her with a sense of something alien and cruel. Her absence did not affect their enjoyment; they had forgotten her in the delight of being together; and for the first time a selfish sorrow stirred in her heart and filled her eyes with sudden tears. "Did she grudge them their happiness?" she asked herself. "Was not success enough for her?"

When Flora had gone to her room that night, Bell knocked at the door and went in.

"Haven't you any thing to tell me?" she asked. "Has *nothing* happened?"

"What should happen, you dear old sleepy owl, you? Oh yes; I broke your India china bowl. A sin confessed is half redressed. We meet, but we miss you; we linger to caress you—at least *I* do. By-the-way, I'm afraid the Reverend Clarence is getting horribly bored with me!"

"What impossible nonsense, Flora!" Was love teaching Flora to prevaricate?

The following night, as Bell was going softly down to the kitchen for mustard, the door of Mr. Gascoigne's study opened, and the draught blew out her candle as he closed it and came forward.

"You keep late vigils, Mr. Gascoigne," she exclaimed. "It has just struck twelve."

"The truth is," he explained, "I had gotten behindhand with my sermon. I've been dissipating too much, I'm afraid, with your lively friend."

"And of what do you suppose Flora is afraid? That you are getting bored with her!"

"Bored with Flora?" he repeated, smiling broadly. "Can't you imagine who never bores me?"

"Is it a riddle?" laughed Bell, with a sob in her throat. "I suppose I might guess with a great effort of imagination!" Why did he torture her with his confidences?

"I should think you might," he pursued, still smiling, but not so confidently. "During your absence at Mrs. Raymond's bedside I have become confirmed in a sentiment whose existence I had only suspected before. Is there any hope for me, I wonder?"

"Any hope?" she answered, confusedly—"any hope? I—how can I tell?"

"Don't you know?" he asked, mournfully,

his great dark eyes shining appealingly in the dim light. "Couldn't you find out, dear Miss Bell? Couldn't you give me a morsel of encouragement?"

"I could—I will find out—if you wish. I would give it now—this minute—you know I would, don't you?—if I could—if I dared—if I were certain—"

Did he doubt that Flora loved him?

"Bless you!" he said, fervently. "I am willing to wait; it is so much better than despair dealt at one blow." Then he lighted her candle from his own, and left her, with blank dismay pictured upon her face. There was no question but her match-making had succeeded, and she herself was in love with Clarence Gascoigne! Another woman might have played false at this unexpected crisis, and deemed that all was fair in love, but Bell Raymond was of finer clay.

"You dear old go-between," cried Flora, when Bell made her revelations, "the Bishop Valentine himself couldn't hold a candle to you. It's too good to be true. Do I love him? *Don't I?* 'Confirmed in a sentiment whose existence he had only suspected before Mrs. Raymond's illness,' is he? Well, I must confess I hardly expected such good fortune. He's so reserved, I suppose, and—and— Why, he has never so much as kissed my hand, or pressed it, though he has had plenty of opportunity. Well, you can go tell him that the adage, 'Faint heart never won fair lady,' is disproved. I'll wait here."

Somebody knocked faintly at Mr. Gascoigne's study door. "Come in," he said, mistaking it for the maid.

"Flora is waiting for you in the parlor," began Bell.

"Waiting for me?—Flora?" repeated Mr. Gascoigne.

"Yes. I have told her; she is waiting to confirm your hope, Mr. Gascoigne. She bids me say that the adage, 'Faint heart never won fair lady,' is disproved. When you intimated to me the other night that you loved her, I suspected that it was not in vain, but I could not be certain, you know. Now I *know* she loves you with all her heart. I am sure of it. Don't let me keep you an instant; it must seem like an eternity to Flora. She is waiting for you—in the parlor. Go! Why do you hesitate? Don't you believe me?"

Mr. Gascoigne had risen, deathly pale, with a solemn, wounded look in his shining eyes, and great circles growing beneath them; his lips moved without forming words. His whole attitude was that of one overcome with unexpected happiness, it seemed to Bell, as he steadied himself by grasping with trembling hands the chair beside him.

"You told Flora that I loved her?" he gasped. "You told her that I loved her?"

"Why, yes; I told her you had been confirmed in a sentiment whose existence you had only suspected before you were thrown

together so much by Aunt Milly's illness," repeated Bell.

"And you say that Flora loves me? You are sure of it?"

"I am sure. Go and ask her;" and Bell went slowly out; but it was some time before Mr. Gascoigne obeyed her.

"He is the oddest lover in the world," confessed Flora, later. "Nothing spooney or gushing about him. I suppose it wouldn't be dignified for a clergyman. Why, he only kissed me twice, if you'll believe it, Bell, and looked as solemn as an owl, and said he hoped he should make me happy. Goodness! I'm happy already, and I told him so. Do you know, Bell, I never had an out-and-out offer before, though I'm twenty-seven."

Miss Raymond offered thanks when Mr. Gascoigne took his vacation to the White Hills, and Flora went home to acquaint her friends with her new prospects, and to join her lover, with her mother, at the Mountain House later. Bell's summer's work was ended; there was nothing more for her to do but to sit down and count the cost of match-making. In the mean time Flora wrote her friend long confidential letters from the mountains.

"Such larks! We do nothing but enjoy ourselves. Who do you think we found here but his high-and-mightiness the heir of Pine Hill, Mr. Chester Callender, of Haphazard. And such a swell! He danced with me five times at the hop last night—and didn't the other women look daggers! One dared to say it was because I'm engaged, and it's so safe flirting with engaged girls—all the fun and none of the danger! Let them rave! If I weren't engaged—who knows?—I might fancy living at Pine Hill, with a retinue of servants, driving in my carriage, and crackling in my silks. I didn't tell you, did I, that the stocks in which my money was invested have declined most shamefully? So Mr. Discount, my business man, writes me. But there's dear old Clarence—do you know, he isn't a particle jealous!" While a later date ran, "Mr. Callender and I are just in from a climb up the mountain with a small party. Clarence went with some gentlemen last week camping out, and didn't care to repeat history. We got separated from the others, Mr. Callender and I, and lost our way; and we should have been there now, for all I know, if Clarence and a man hadn't come to our rescue with lantern and torches. Mr. Callender is taking my picture, in crayon—I sometimes really believe he is sweet on me, in spite of Clarence. Mr. Callender's eyes are blue and small, and his mustache is—well, lemon-colored, maybe; but his figure and manners are perfectly stunning. He always makes you feel as if you were the one person of all the world whom he delighted to honor."

And, after that, Bell heard no more, and a fortnight later Mr. Gascoigne was at home again, and settling to his parish duties. He found Bell at twilight the day after his return, with her Sleepy-Hollow chair wheeled before the window, watching the stars come out in the evening sky, and listening to the crickets' sing-song.

"Star-gazing?" he asked, resting an elbow on the cushioned back of her seat. "A penny for your thoughts."

"I didn't hear you come in, Mr. Gascoigne," she said. "I am thinking about—about Flora! How did you leave her?"

"Flora? Haven't you heard?"

"My last letter is a month old."

"And nobody has told you about her?"

"Who could tell me about her so well as yourself?"

Mr. Gascoigne laughed. "Well, Mr. Callender, perhaps."

"Mr. Callender! What are you talking about, Mr. Gascoigne?"

"Flora and Mr. Callender."

"What of them?"

"They are married—that is all."

"Married! Flora married to Mr. Callender! Is it true? Oh, Mr. Gascoigne! How could she be so wicked! Oh! oh! oh!" and she staggered to her feet and held out both arms, not knowing what she did.

"Wicked?" echoed the young rector, taking the proffered hands, and holding them firmly—"I don't know about that. It isn't wicked to marry the man you love best, even at the risk of breaking another's heart, is it? And then my heart is in excellent condition; I assure you, Flora hasn't been able to effect a flaw. It was all a mistake, you know, from first to last—Flora knows it now herself. My dear Miss Bell, you rather overdid the match-making business, did you not? And I—I was weak and Quixotic, I grant you; it was unpardonable, I admit, now that I look back upon it. But if the girl really loved me; if I had unwittingly won her heart; if you had led her to believe, thanks to my own stupidity, that I had been such a blockhead as to confess my love for her to you—why, it was only right that I should abide by my own awkward mistake. I must have been miraculously obscure that night, Bell, and you must be the least conceited woman in the world, or you would have understood that I loved you, and not Flora."

"O—h," said Bell, with a little sigh, "I wish I had understood!"

"It isn't too late, is it? If you had understood, what should you have said, Bell?"

"I should have said, 'Yes.'"

"My dear Bell," wrote Mrs. Callender to Mrs. Gascoigne on her wedding morning, "allow me to congratulate you on your talent for match-making."

SUNRISE ON MOUNT WASHINGTON.

WE left behind the leafy arms of shade,
 The green soft grasses and the blossoms fair—
 Left the brown brook that lulling murmur made,
 The smoke-plumed houses scattered every where.
 Before, gray rocks that rose in steeper slope,
 The softening snow, the glacier's foot-marks rough,
 The still-receding summit, mocking hope,
 The glare and silence: was it not enough?
 Above, the hurrying mists went drifting by
 Through rocky clefts; the night climbed up apace:
 We seemed on some spear point uplifted high
 To gaze upon some terror face to face.
 The gray dawn, streaked with angry red, at last
 Lit up the rocks, and when the sun burned through,
 Lo! on the western clouds the shadow vast
 Of the great mountain loomed upon our view.
 O God! have pity. Is there, then, no rest?
 Must pain as infinite as loving be?
 Our weary feet the mountain's path have pressed;
 The laboring breath has come so painfully!
 Behold! upon its side we wake, we sleep,
 Forever climbing through its shadows deep.
 Oh, when at last behind, beneath, it lies,
 Let not its shadow fall upon the skies!

THE WAVING OF THE CORN.

PLOUGHMAN, whose gnarly hand yet kindly wheeled
 Thy plough to ring this solitary tree
 With clover, whose round plat, reserved afield,
 In cool green radius twice my length may be—
 Scanting the corn thy furrows else might yield,
 To pleasure August, bees, fair thoughts, and me,
 That here come oft together—daily I,
 Stretched prone in summer's mortal ecstasy,
 Do stir with thanks to thee, as stirs this morn
 With waving of the corn.

Unseen, the farmer's boy from round the hill
 Whistles a snatch that seeks his soul unsought,
 And fills some time with tune, howbeit shrill;
 The cricket tells straight on his simple thought—
 Nay, 'tis the cricket's way of being still;
 The peddler bee drones in, and gossips naught;
 Far down the wood, a one-desiring dove
 Times me the beating of the heart of love:
 And these be all the sounds that mix, each morn,
 With waving of the corn.

From here to where the louder passions dwell,
 Green leagues of hilly separation roll:
 Trade ends where yon far clover ridges swell.
 Ye terrible Towns, ne'er claim the trembling soul
 That, craftless all to buy or hoard or sell,
 From out your deadly complex quarrel stole
 To company with large amiable trees,
 Suck honey summer with unjealous bees,
 And take Time's strokes as softly as this morn
 Takes waving of the corn.

PERCY AND THE PROPHET:

EVENTS IN THE LIVES OF A LADY AND HER LOVERS.

FIRST WORDS.

THE late Lieutenant-Colonel Bervie was generally very willing to tell the eventful love story of his youthful days to any persons who were really desirous of hearing it. In relating, at the outset of his narrative, the extraordinary manner in which a total stranger foretold certain events which affected the happiness of two other persons besides himself, he never laid any claims to the unquestioning belief of his audience. "Form your own opinion, friends," he used to say. "Whether I am relating a series of marvels or a series of coincidences, I give you my word of honor I am telling you the truth. If this assurance does not satisfy you, I can only recommend the same modest view of the questions that are beyond the range of our own experience which wise Shakespeare advocates in those well-known lines: 'There are more things in heaven and earth, Horatio, than are dreamt of in your philosophy.'"

So the old soldier spoke, when years had taught him to be tolerant of all men, in the peaceful evening of his life.

The story is once more told in these pages, with the colonel's reservations, though not always in the colonel's language. For example, the noble conduct of one of the characters (to which he never did justice) will now be found to occupy the prominent place on the scene that is fairly its due.

THE STORY.

PART I.—THE PREDICTION.

CHAPTER I.—THE QUACK.

THE disasters that follow the hateful offense against Christianity which men call War were severely felt in England during the peace that ensued on the overthrow of Napoleon at Waterloo. At this melancholy period of our national history, agriculture, manufactures, and commerce suffered an unexampled depression. The deficiency in the revenue was publicly acknowledged in Parliament to be alarming. With rare exceptions, distress prevailed among all classes of the community. The starving nation was ripe and ready for a revolutionary rising against its rulers—the rulers who had shed the people's blood and wasted the people's substance in a war which had yielded to the popular interests absolutely nothing in return.

Among the unfortunate persons who were driven, during the disastrous early years of this century, to strange shifts and devices to obtain the means of living, was a certain obscure medical man, of French extraction, named Lagarde. The doctor (duly qualified in England as well as in his own country to bear the title) was an inhabitant of London, living in one of the narrow streets which connect the great thoroughfare of the Strand with the banks of the Thames.

The method of obtaining employment chosen by poor Lagarde, as the one alternative left in the face of starvation, was, and is still, considered by the medical profession to be the method of a quack. He advertised in the public journals.

In language studiously free from pretense or exaggeration, the French physician declared himself to have been converted to a belief in animal magnetism (as it was then called) by serious study of the discoveries first announced in France by the famous Mesmer. The two classes of the community to which his appeal was addressed were (first) persons of the invalid sort, afflicted with maladies which ordinary medical practice had failed to cure; and (secondly) persons disposed toward mystical investigation, who might be inclined to test the power of "clairvoyance" as a means of revealing the hidden chances and changes of the future. "No fee is exacted from those who may honor me with their confidence," the doctor modestly added, "because I can not guarantee beforehand that I shall be successful in ministering to their necessities and wishes. The process that I employ is no secret: it was first made public long before my time. I am thrown into a magnetic sleep, and the hand of the person who consults me is placed in mine. The result depends entirely on mysterious laws of nervous sympathy and nervous insight, to the existence of which I can testify, but which (in the present state of scientific inquiry) I am not able to explain. Those whom I am fortunate enough to satisfy are requested to drop their offerings, according to their means, into a money-box fixed on the waiting-room table. Those whom I do not satisfy will be pleased to accept the expression of my regret, and will not be expected to give any thing. It is quite possible that I may be the dupe of mistaken convictions: all I ask of the public is to believe that they are at least the convictions of an honest man. I have only to add that ladies and gentlemen who may wish to give me a trial will find me at home in the evening, between the hours of six and ten."

Toward the close of the year 1816 this strange advertisement became a general topic of conversation among educated people in London. For some weeks the "sittings" of the seer were largely attended, and (all things considered) were not badly remunerated. A faithful few believed in him, and told wonderful stories of what he had pronounced and prophesied in his state of trance. The majority of his visitors simply viewed him in the light of a public amusement, and wondered why such a gentleman-like man should have chosen to gain his living by exhibiting himself as a quack.

CHAPTER II.—THE NUMBERS.

ON a raw and snowy evening toward the latter part of January, 1817, a gentleman, walking along the Strand, turned into the street in which Doctor Lagarde lived, and knocked at the mesmerist's door. The gentleman was young and handsome, with a certain peculiarity in his gait which revealed him as belonging to the military profession. His dress studiously avoided the exaggerations and absurdities of the hideous fashion prevailing in those days. In a word, the outward mark set on him was the mark which unmistakably proclaims a well-bred man.

He was admitted by an elderly male servant to a waiting-room on the first floor. The light of

one little lamp, placed on a bracket fixed to the wall, was so obscured by a dark green shade as to make it difficult, if not impossible, for visitors meeting by accident to recognize each other. The metal money-box fixed to the table was just visible. In the flickering light of a small fire the stranger perceived the figures of three men seated, apart and silent, who were the only occupants of the room besides himself. The wretched weather had, no doubt, kept the doctor's lady visitors at home. So far as objects were to be seen, there was nothing to attract attention in the waiting-room. The furniture was plain and neat, and nothing more. The elderly servant handed a card, with a number inscribed on it, to the new visitor, said in a whisper, "Your number will be called, Sir, in your turn," and disappeared. For some minutes nothing disturbed the deep silence but the faint ticking of a clock. After a while a bell rang from an inner room, a door opened, and a gentleman appeared, whose interview with Doctor Lagarde had terminated. His opinion of the sitting was openly expressed in one emphatic word—"Humbug!" No contribution dropped from his hand as he passed the money-box on his way out.

The next number (being Number Fifteen) was called by the elderly servant, and the first incident occurred in the strange series of events destined to happen in the doctor's house that night.

One after another the three men who had been waiting rose, examined their cards under the light of the lamp, and sat down again, surprised and disappointed. The servant advanced to investigate the matter. The numbers possessed by the three visitors, instead of being Fifteen, Sixteen, and Seventeen, proved to be Sixteen, Seventeen, and Eighteen. Turning to the stranger who had arrived the last, the servant said:

"Have I made a mistake, Sir? My sight is not so good as it was, and I am afraid I have awkwardly confused the cards in this dark place. Have I given you Number Fifteen instead of Number Eighteen?"

The gentleman produced his card. A mistake had certainly been made, but not the mistake that the servant supposed. The card held by the latest visitor turned out to be the card previously held by the dissatisfied stranger who had just left the room—Number Fourteen! As to the card numbered Fifteen, it was only discovered the next morning lying in a corner, dropped on the floor!

Acting on his first impulse, the servant hurried out of the room, calling to the gentleman who had been the original holder of Fourteen to come back and bear his testimony to that fact. The street door had been opened for him by the landlady of the house. She was a pretty woman, and the gentleman had fortunately lingered to talk to her. He was induced, at the intercession of the landlady, to ascend the stairs again. On returning to the waiting-room he addressed a characteristic question to the assembled visitors. "*More humbug?*" asked the gentleman who liked to talk to a pretty woman.

The servant—completely puzzled by his own stupidity—attempted to make his apologies.

"Pray forgive me, gentlemen," he said. "I am afraid I have confused the cards I distribute with the cards returned to me. In the case of mistakes of any kind, I am ordered to set them

right on the spot. In *this* case, I think I had better consult my master."

He disappeared in the inner room. Left by themselves, the visitors began to speak jestingly of the strange situation in which they were placed. The original holder of Number Fourteen described his own experience of the doctor in his own pithy way. "I applied to the fellow to tell my fortune. He first went to sleep over it, and then he said he could tell me nothing. I asked why. 'I don't know,' says he. '*I do*,' says I—'*humbug!*' I'll bet you the long odds, gentlemen, that *you* find it humbug too."

Before the wager could be accepted or declined, the door of the inner room was opened again. The tall, lean, black figure of a new personage appeared on the threshold, relieved darkly against the light in the room behind him. A singularly quiet, sad voice addressed the visitors in these words:

"Gentlemen, I must beg your indulgence. The apparent accident which has given to the last comer the number already held by a gentleman who has unsuccessfully consulted me, may have a meaning which we can none of us at present see. Observe, I don't speak positively; I only say it may be. If the three visitors who have been so good as to wait will allow the present holder of Number Fourteen to consult me out of his turn—and if the earlier visitor who left me dissatisfied with his consultation will consent to stay here a little longer—I pledge myself, if nothing happens during the first ten minutes of the interview, to receive the gentlemen who have yet to consult me, and to detain no longer the gentleman who has seen me already. On the other hand, if any thing does happen, there is a chance at least that one among you—most likely the original holder of Number Fourteen—may be concerned in it. Under these circumstances, is ten minutes' patience too much to ask of you?"

The three visitors who had waited longest consulted among themselves, and (having nothing better to do with their time) decided on accepting the doctor's proposal. The visitor who believed it all to be "humbug" coolly took a gold coin out of his pocket, tossed it into the air, caught it in his closed hand, and walked up to the shaded lamp on the bracket. "Heads, stay," he said, "Tails, go." He opened his hand and looked at the coin. "Heads! Very good. Go on with your hocus-pocus, Sir—I'll wait."

"You believe in chance," said the doctor, quietly observing him. "That is not my experience of life."

He paused to let the stranger who held Number Fourteen pass him into the inner room—then followed, closing the door behind him.

CHAPTER III.—THE CONSULTATION.

THE consulting-room was better lit than the waiting-room, and that was the only difference between the two. In the one, as in the other, no attempt was made to impress the imagination. Every where the commonplace furniture of a London lodging-house was left without the slightest effort to alter or improve it by changes of any kind.

Seen under the clearer light, Doctor Lagarde appeared to be the last person living who would consent to degrade himself by an attempt at imposture of any kind. His eyes were the dreamy

eyes of a visionary; his look was the prematurely aged look of a student, accustomed to give the hours to his book which ought to have been given to his bed. To state it briefly, the disciple of Mesmer was a man who might easily be deceived by others, but who was incapable of consciously practicing deception himself. Signing to his visitor to take a chair, he seated himself on the opposite side of the small table that stood between them, waited a moment with his face hidden in his hands, as if to collect himself, and then spoke.

"Do you come to consult me on a case of illness," he inquired, "or do you ask me to look into the darkness which hides your future life?"

The stranger answered, gravely: "I have no need to consult you about my health. I come to hear what you can tell me of my future life."

"You know that I can try," pursued the doctor, "but that I can not promise to succeed?"

"I accept your conditions," the stranger rejoined. "I neither believe nor disbelieve. If you will excuse my speaking frankly, I mean to observe you closely, and to decide for myself."

Doctor Lagarde smiled sadly.

"You have heard of me as a charlatan who contrives to amuse a few idle people," he said. "I don't complain of that; my present position leads necessarily to misinterpretation of myself and my motives. Still I may at least say that I am the victim of a sincere avowal of my belief in a great science. Yes! I repeat it, a great science! New, I dare say, to the generation we live in, though it was known and practiced in the days when the Pyramids were built. My sincerity in this matter has cost me the income that I derived from my medical practice. Patients distrust me; doctors refuse to consult with me. I could starve if I had no one to think of but myself. But I have another person to consider, who is very dear to me; and I am driven, literally driven, either to turn beggar in the streets or to do what I am doing now. Every thing is against me. I am a needy foreigner (naturally distrusted in this country). I am a republican and a socialist (naturally exiled from my own country). Who will help such an outlawed man as I am? It doesn't matter. The age is advancing, and the great truths which it is my misfortune to advocate before the time is ripe for them, are steadily forcing their way to recognition. They will conquer yet, when the hard struggle of life is over for the poor quack who now presumes to speak to you. Enough (and too much) of myself! Let us, as you say in England, get to business. To be of any use to you, I must first be thrown into the magnetic trance. The person who has the strongest influence over me is the person who will do it to-night." He paused, and looked round toward the corner of the room behind him. "Mother," he said, gently, "are you ready?"

An elderly lady, dressed in deep mourning, rose from her seat in the corner. She had been, thus far, hidden from notice by the high back of the easy-chair in which her son sat. Excepting some folds of fine black lace, laid over her white hair so as to form a head-dress at once simple and picturesque, there was nothing remarkable in her attire. The visitor, well accustomed to the society of women of high rank and breeding, rose and bowed, as if (stranger though she was to him) he recognized a person of distinction. She

gravely returned his salute, and moved round the table so as to place herself opposite to her son.

"When you please, Henry," she said.

Bending over him, she took both the doctor's hands in hers, and fixed her eyes steadily on his. No words passed between them; nothing more took place. In a minute or two his head was resting against the back of the chair, and his eyelids had closed.

"Are you sleeping?" asked Madame Lagarde.

"I am sleeping," he answered.

She laid his hands gently on the arms of the chair, and turned to address the visitor.

"Let the sleep gain on him for a minute or two more," she said. "Then take one of his hands, and put to him what questions you please."

"Does he hear us now, madam?"

"You might fire off a pistol, Sir, close to his ear, and he would not hear it. The vibration might disturb him; that is all. Until you or I touch him, and so establish the nervous sympathy, he is as lost to all sense of our presence here as if he were dead."

"You believe in magnetism yourself, of course?"

"My son's belief, Sir, is mine in this thing as in other things. I have heard what he has been saying to you. It is for me that he sacrifices himself by holding these exhibitions; it is in my poor interests that his hardly earned money is made. I am in infirm health; and remonstrate as I may, my son persists in providing for me, not the bare comforts only, but even the luxuries of life. Except in this, he has never heard me express a wish without cheerfully obeying it. Whatever I may suffer, I have my compensation; I can still thank God for giving me the greatest happiness that a woman can enjoy, the possession of a good son." She smiled fondly as she looked at the sleeping man. "Draw your chair nearer to him," she resumed, "and take his hand. You may speak freely in making your inquiries. Nothing that happens in this room ever goes out of it."

With those words, she returned to her place in the corner behind her son's chair.

The visitor took Doctor Lagarde's hand. As they touched each other, he was conscious of a faintly titillating sensation in his own hand—a sensation which oddly reminded him of by-gone experiments with an electrical machine, in the days when he was a boy at school.

"I wish to question you about my future life," he began. "How ought I to begin?"

The doctor spoke his first words in the monotonous tones of a man talking in his sleep.

"Own your true motive before you begin," he said. "Your interest in your future life is centred in a woman. She has not positively rejected you, and she has not openly encouraged you, in the time that is past. You wish to know if her heart will be yours in the time that is to come—and there your interest in your future life ends."

This startling assertion of the sleeper's capacity to look, by sympathy, into his mind, and to see there his most secret thoughts, instead of convincing the stranger, excited his suspicions. "You have means of getting information," he said, roughly, "that I don't understand."

The doctor laughed, as if the idea amused him. Madame Lagarde rose from her place and interposed.

"Hundreds of strangers come here to consult my son," she said, quietly. "If you believe that

we know who those strangers are, and that we have the means of inquiring into their private lives before they enter this room, you believe in something much more incredible than the magnetic sleep!"

This was too manifestly true to be disputed. The visitor (a man of strong good sense when his temper was not ruffled) made his apologies.

"I should like to have *some* explanation," he added. "The thing is so very extraordinary. How can I prevail upon Doctor Lagarde to enlighten me?"

"He can only tell you what he sees," Madame Lagarde answered; "ask him that, and you will get a direct reply. For instance, say to him now, 'Do you see the lady?'"

The stranger repeated the question. The reply followed at once, in these words:

"I see darkness all about me, except in one place, where there is light like the light of a dim moon. In the illuminated space, I see two figures standing side by side. One of them is your figure. The other is the figure of a lady. She only appears dimly. I can see nothing but that she is taller than women generally are, and that she is dressed in pale blue."

The stranger started at those words. "Her favorite color!" he thought to himself, forgetting that, while he held the doctor's hand, the doctor could think with *his* mind.

"Yes," added the sleeper, quietly, "her favorite color, as you know. She fades and fades as I look at her," he went on. "She is gone. I only see you. Your hands are over your face; you are crying; you look like a man who is suffering from some dreadful disappointment. Wait a little. You too are growing indistinct; you too fade away altogether. The darkness gathers. I see nothing."

A pause of silence followed. Then the face of the sleeper began to show signs of disturbance for the first time. The stranger put the customary question to him: "What do you see?"

"I see you again. You have a pistol in your hand. Opposite to you there stands the figure of another man. He too has a pistol in his hand. Are you enemies? Are you meeting to fight a duel? Is the lady the cause? I try, but I fail to see her."

"Can you describe the man?"

"Not yet. So far, he is only a shadow in the form of a man."

There was another interval. The appearance of disturbance grew more marked on the sleeper's face. Suddenly he waved his free hand in the direction of the waiting-room.

"Send for the visitors who are there," he said. "They are all to come in. Each one of them is to take one of my hands in turn—while you remain where you are, holding the other. Don't let go of me, even for a moment. My mother will ring."

Madame Lagarde touched a bell on the table. The servant received his orders from her and retired. After a short absence, he appeared again in the consulting-room, with one visitor only waiting on the threshold behind him.

CHAPTER IV.—THE MAN.

"THE other three gentlemen have gone away, madam," the servant explained, addressing Madame Lagarde. "They were tired of waiting. I found *this* gentleman fast asleep; and I am afraid

he is angry with me for taking the liberty of waking him."

"Sleep of the common sort is evidently not allowed in this house," the gentleman remarked at the door. "It isn't my fault—I couldn't mesmerize myself, could I?"

The speaker entered the room, and stood revealed as the original owner of the card numbered Fourteen. Viewed by the clear lamp-light, he was a tall, finely made man, in the prime of life, with a florid complexion, golden-brown hair, and sparkling blue eyes. Noticing Madame Lagarde, he instantly checked the flow of his satire, with the instinctive good-breeding of a gentleman. "I beg your pardon," he said; "I have a great many faults, and a habit of making bad jokes is one of them. Is the servant right, madam, in telling me that I have the honor of presenting myself here at your request?"

Madame Lagarde briefly explained what had passed. The florid gentleman (still privately believing it to be all "humbug") was delighted to make himself of any use. "I congratulate you, Sir," he said, with his easy humor, as he passed the visitor who had taken his card. "Number Fourteen seems to be a luckier number in your keeping than it was in mine."

As he spoke, he took Doctor Lagarde's disengaged hand. The instant they touched each other, the sleeper started. His voice rose; his face flushed. "You are the man!" he exclaimed. "I see you plainly now!"

"What am I doing?"

"You are standing opposite to the gentleman here who is holding my other hand; and you are lifting a pistol to take aim at him."

The unbeliever cast a shrewd look at his companion in the consultation. His inveterate habit of taking the ironical view of every thing got the better of him again.

"Considering that you and I are total strangers, Sir," he said, "don't you think the doctor had better introduce us, before he goes any farther? We have got to fighting a duel already, and we may as well know who we are, before the pistols go off." He turned to Doctor Lagarde. "Dramatic situations don't amuse me out of the theatre," he resumed. "Let me put you to a very commonplace test. I want to be introduced to this gentleman. Has he told you his name?"

"No."

"Of course you know it, without being told?"

"Certainly. I have only to look into your own knowledge of yourselves while I am in this trance, and while you have got my hands, to know both your names as well as you do."

"Introduce us, then!" retorted the jesting gentleman. "And take my name first."

"Mr. Percy Linwood," replied the doctor, "I have the honor of presenting you to Captain Bervie, of the Artillery."

With one accord, the gentlemen both dropped Doctor Lagarde's hands, and looked at each other in blank amazement.

"Of course he has discovered our names somehow," said Mr. Percy Linwood, cutting the Gordian knot to his own perfect satisfaction in that way.

Captain Bervie had not forgotten what Madame Lagarde had said to him when he too had suspected a trick. He now repeated it (quite ineffectually) for Mr. Linwood's benefit. "If you

don't feel the force of that argument as I feel it," he added, "perhaps, as a favor to me, Sir, you will not object to our each taking the doctor's hand again, and hearing what more he can tell us while he remains in the state of trance?"

"With the greatest pleasure," answered good-humored Mr. Linwood. "Our friend is beginning to amuse me; I am as anxious as you are to know what he is going to see next."

Captain Bervie put the next question.

"You have seen us fighting a duel—can you tell us the result?"

"I can tell you nothing more than I have told you already. The figures of the duelists have faded away, like the other figures that I saw before them. What I see now looks like the winding gravel-path of a garden. A man and a woman are walking toward me. The man stops, and places a ring on the woman's finger, and kisses her."

Captain Bervie changed color, and said no more. Mr. Linwood put the next question, in his usual flippant way.

"Who is the happy man?" he asked.

"You are the happy man," was the instantaneous reply.

"Who is the woman?" cried Captain Bervie, before Mr. Linwood could speak again.

"The same woman whom I saw before; dressed in the same way, in pale blue."

Captain Bervie was not satisfied. He insisted on receiving clearer information than this. "Surely you can see *something* of her personal appearance?" he said, sharply.

"I can see that she has long dark brown hair, falling below her waist. I can see that she has lovely dark brown eyes. Her complexion seems to be all of the same delicate pale color: she has the look of a sensitive, nervous person. She is quite young. I can see no more."

"Is there any other man present in the garden?" was the captain's next question.

"I can see no other man."

"Look again at the man who is putting the ring on her finger. Are you sure that the face you see is the face of Mr. Percy Linwood?"

"I am absolutely sure."

Captain Bervie rose from his chair.

"Thank you, Doctor Lagarde," he said. "I have heard enough."

He walked to the door. Mr. Percy Linwood dropped the doctor's hand, and appealed to the retiring captain with a broad stare of astonishment.

"You don't really believe this?" he said.

"I only say I have heard enough," Captain Bervie answered, irritably.

Mr. Linwood could hardly fail to see that any further attempt to treat the matter lightly might lead to undesirable results. "It is difficult to speak seriously of this kind of exhibition," he resumed, quietly. "But I suppose I may mention a mere matter of fact without meaning, or giving, offense. The description of the lady, I can positively declare, does not apply in any single particular to any one whom I know."

Captain Bervie turned round sternly at the door, with the look of a man whose patience was completely exhausted. Mr. Linwood's unruffled composure, assisted in its influence by the presence of Madame Lagarde, seemed to remind him of the claims of politeness. He checked the rash

words as they rose to his lips. "You may make new acquaintances, Sir," was all that he said. "You have the future before you."

Upon that he went out. Percy Linwood waited a little, reflecting on the captain's conduct. Had Doctor Lagarde's description of the lady accidentally answered the description of a living lady whom Captain Bervie knew? Was he by any chance in love with her, and had the doctor innocently reminded him that his love was not returned? Assuming this to be likely, was it also possible that he believed in the duel seen by the mesmerist? Did he seriously interpret his absence from the visionary love scene in the garden as an intimation that he was the duelist who was destined to fall? Nobody but a madman could go to those lengths. The captain's conduct was simply incomprehensible.

Pondering these questions, Percy decided on returning to his place by the doctor's chair. "Of one thing I'm certain, at any rate," he thought to himself. "I'll see the whole imposture out before I leave the house!"

He took Doctor Lagarde's hand. "Now, then, what is the next discovery?" he asked, abruptly. "Any thing more about the lady and gentleman in the garden?"

The answer was given in low, languid tones; the sleeper was evidently beginning to suffer from nervous fatigue.

"I see no more of the garden," he said, "or of the persons in it. What I see now is a small room, like a cottage parlor. The woman who has appeared to me throughout presents herself to me again. But, this time, the man who is with her is no longer Mr. Percy Linwood—the man is Captain Bervie."

Percy smiled satirically. "Good news for the captain!" he said. "It's a thousand pities he went away. If he had waited he would have heard something personally interesting to him. May I ask, Doctor Lagarde, how Captain Bervie and the lady are occupied?"

The sleeper seemed to find some difficulty in answering the question. "I can only see," he said, "that the woman is painfully agitated by something that the captain is saying to her. He puts her arm in his; he seems to be trying to persuade her to leave the room with him. She hesitates; she asks him with tears to release her. He whispers something in her ear, which seems to persuade her. She considers; she says a few words on her side; she yields. He leads her out of the room. The darkness gathers behind them. I look and look, and I can see no more."

"Shall we wait a while," Percy suggested, "and then try again?"

Doctor Lagarde sighed, and reclined in his chair. "My head is heavy," he said; "my spirits are dull. I will try again, to please you. Don't blame me if I fail."

After an interval, Percy put the customary question. The sleeper answered wearily.

"I see the inside of a travelling carriage," he said. "The lady is one of the persons in it. There is a man with her. There is—" He stopped, and began to breathe heavily: the grasp of his hand relaxed.

"Am I the man this time?" Percy asked. "Or is it Captain Bervie again?"

Doctor Lagarde roused himself, by a last effort, to reply. "I can't tell you," he murmured, drow-

sily. "My eyes are aching; the darkness baffles me. I have toiled long enough for you. Drop my hand and leave me to rest."

Hearing those words, Madame Lagarde approached her son's chair.

"It will be useless, Sir, to ask him any more questions to-night," she said. "He has been weak and nervous all day, and he is worn out by the effort he has made. Pardon me if I ask you to step aside for a moment, while I give him the repose that he needs."

She laid her right hand gently on the doctor's head, and kept it there for a minute or so. "Are you at rest now?" she asked.

"I am at rest," he answered, in faint, drowsy tones.

Madame Lagarde returned to Percy. "If you are not yet satisfied," she said, "my son will be at your service to-morrow evening, Sir."

"Thank you, madam; I have only one more question to ask, and you can no doubt answer it. When your son wakes, will he remember what he has said to Captain Bervie and to myself?"

"My son will be as absolutely ignorant of every thing that he has seen, and of every thing that he has said, in the trance, as if he had been at the other end of the world."

Percy Linwood swallowed this last outrageous assertion with an effort which he was quite unable to conceal. "Many thanks, madam," he said; "I wish you good-night."

Returning to the waiting-room, he noticed the money-box fixed to the table. "These people look poor," he thought to himself, "and I feel really indebted to them for an amusing evening. Besides, I can afford to be liberal, for I shall certainly never go back." He dropped a five-pound note into the money-box, and left the house.

Walking toward his club, Percy's natural serenity of mind was a little troubled by the remembrance of Captain Bervie's strange language and conduct. Something in the captain's manner, rudely as he had spoken on leaving the room, had interested Percy in spite of himself. He began to consider the propriety of reducing to writing Doctor Lagarde's description of the scenes in the cottage parlor and the travelling carriage, in the event of another meeting between Captain Bervie and himself. If the captain persisted in taking the thing seriously, the memorandum might additionally enlighten him. If, on the other hand, he ended in adopting the rational view, the memorandum might confirm him in taking that sensible course.

Arrived at his club, Percy resolutely set to work in the writing-room. Unhappily for his chances of success, he was one of that large number of persons whose minds become confused the moment they take a pen in their hands. First, he tried to report the doctor's language literally, and failed to remember it when he put the first words on paper. Then he attempted a brief summary, and lost the thread of his narrative at the second sentence. After spoiling many sheets of paper, and using every new pen within his reach, he gave up the struggle. "It's no use," he said, as he got up from the writing-table. "I am too great a fool to do it, and there's an end of the business."

He never was more mistaken in his life. The end of the business was not to come for many a long day yet.

PART II.—THE FULFILLMENT.

CHAPTER V.—THE BALL-ROOM.

WHILE the consultation at Doctor Lagarde's was still fresh in the memory of the persons present at it, Chance, or Destiny, occupied in sowing the seeds for the harvest of the future, discovered as one of its fit instruments a retired military officer named Major Much.

The major was a smart little man, who persisted in setting up the appearance of youth as a means of hiding the reality of fifty. After serving with distinction in many parts of the world, Major Much had become an independent man by inheriting an estate in one of the midland counties. Being still a bachelor, and being always ready to make himself agreeable, he was generally popular in the society of women. In the ball-room he was a really welcome addition to the company. The German waltz had then been imported into England little more than three years since. The outcry raised against the dance, by persons skilled in the discovery of latent impropriety, had not yet lost its influence in certain quarters. Men who could waltz were scarce. Major Much had successfully grappled with the difficulties of learning the dance in mature life; and the young ladies rewarded him nobly for the effort by taking the appearance of youth for granted, in the palpable presence of fifty.

Knowing every body and being welcome every where, playing a good hand at whist, and having an inexhaustible fancy in the invention of a dinner, Major Much naturally belonged to all the best clubs of his time. Percy Linwood and he constantly met in the billiard-room or at the dinner table. The major approved of the easy, handsome, pleasant-tempered young man. "I have lost the first freshness of youth," he used to say, modestly, of himself, "and I see it revived, as it were, in Percy. Naturally I like Percy."

About three weeks after the memorable evening at Doctor Lagarde's, the two friends encountered each other on the steps of a club.

"Got any thing to do to-night?" asked the major.

"Nothing that I know of," said Percy, "unless I go to the theatre."

"Let the theatre wait, my boy. My old regiment gives a ball at Woolwich to-night. I have got a ticket to spare, and I know several sweet girls who are going. Some of them waltz, Percy! Gather your rose-buds while you may. Come with me."

The invitation was accepted as readily as it was given. The major found the carriage, and Percy paid for the post-horses. They entered the ball-room among the earlier guests; and the first person whom they met, waiting near the door, was—Captain Bervie.

Percy bowed, a little uneasily. "I feel some doubt," he said, laughing, "whether we have been properly introduced to one another or not."

"Not properly introduced!" cried Major Much. "I'll set that right. My dear friend, Percy Linwood; my dear friend, Arthur Bervie—be known to each other! esteem each other!"

Captain Bervie acknowledged the introduction by a cold salute. Percy, yielding to the good-natured impulse of the moment, began to speak of the mesmeric consultation.

"You missed something worth hearing when you left the doctor the other night," he said. "We continued the sitting; and *you* turned up again among the persons of the doctor's drama, in quite a new character. Imagine yourself, if you please, in a cottage parlor—"

"Excuse me for interrupting you," said Captain Bervie. "I am a member of the committee charged with the arrangements of the ball, and I must really attend to my duties."

He withdrew without waiting for a reply. Percy looked round wonderingly at Major Much. "Strange!" he said. "I feel rather attracted toward Captain Bervie; and he seems so little attracted, on his side, that he can hardly behave to me with common civility. What does it mean?"

"I'll tell you," answered the major, confidentially. "Arthur Bervie is madly in love—madly is really the word, my boy—with a Miss Bowmore. And (this is between ourselves) the young lady doesn't feel it quite in the same way. A sweet girl; I've often had her on my knee when she was a child. Her father and mother are old friends of mine. She is coming to the ball to-night. That's the true reason why Arthur left you just now. Look at him—waiting to be the first to speak to her. If he could have his way, he wouldn't let another man come near the poor girl all through the evening; he really persecutes her. I'll introduce you, Percy; and you will see how he looks at us for presuming to approach her. It's a great pity; she will never marry him. Arthur Bervie is a high-minded, honorable fellow, a man in a thousand; but he's fast becoming a perfect bear under the strain on his temper. What's the matter? You don't seem to be listening to me."

This last remark was perfectly justified. In telling the captain's love story, Major Much had revived his young friend's memory of the lady in the blue dress, who had haunted the mesmeric visions of Doctor Lagarde. "Tell me," said Percy, "what is Miss Bowmore like? Is there any thing remarkable in her personal appearance? I have a reason for asking."

As he spoke, there arose among the guests in the rapidly filling ball-room a low murmur of surprise and admiration. The major laid one hand on Percy's shoulder, and, lifting the other, pointed to the door.

"What is Miss Bowmore like?" he repeated. "There she is, my boy! Let her answer for herself."

Percy turned toward the lower end of the room. A young lady was entering, dressed in plain silk, and the color of it was a pale blue! Excepting a white rose at her breast, she wore no ornament of any sort. Doubly distinguished by the perfect simplicity of her apparel and by her tall, supple, commanding figure, she took rank at once as the most remarkable woman in the room. Moving nearer to her through the crowd, under the guidance of the complaisant major, young Linwood gained a clearer view of her hair, her complexion, and the color of her eyes. In every one of these particulars she was the living image of the woman described by Doctor Lagarde!

While Percy was absorbed over this strange discovery, Major Much had got within speaking distance of the young lady and of her mother, as they stood together in conversation with Captain Bervie. "My dear Mrs. Bowmore, how well you are looking! My dear Miss Charlotte, what a

sensation you have made already!" cried the cordial little man. "The glorious simplicity (if I may so express myself) of your dress is—is—what was I going to say?—the ideas come thronging on me; I merely want words."

Here Major Much waved his hand, with all the fingers well open, as if words were circulating in the air of the room, and he meant to catch them. Miss Charlotte burst into a little silvery laugh; her magnificent brown eyes, wandering from the major to Percy, rested on the young man with a modest and momentary interest, which Captain Bervie's jealous attention instantly detected.

"They are forming the dance, Miss Bowmore," he said, pressing forward impatiently. "If we don't take our places, we shall be too late."

"Stop! stop!" cried the major. "There is a time for every thing, and this is the time for presenting my dear friend here, Mr. Percy Linwood. He is like me, Miss Charlotte—he has been struck by the glorious simplicity, and *he* wants words." At this part of the presentation he happened to look toward the irate captain, and instantly gave him a hint on the subject of his temper. "I say, Arthur Bervie, we are all good-humored people here. What have you got on your eyebrows? It looks like a frown, and it doesn't become you. Send for a skilled waiter, and have it brushed off and taken away directly!"

"May I ask, Miss Bowmore, if you are disengaged for the next dance?" said Percy, the moment the major gave him an opportunity of speaking.

"Miss Bowmore is engaged to *me* for the next dance," said the angry captain, before the young lady could answer.

"The third dance, then?" Percy persisted, in his quietest manner, and with his brightest smile.

"With pleasure, Mr. Linwood," said Miss Bowmore. She would have been no true woman if she had not resented the open exhibition of Arthur's jealousy; it was like asserting a right over her to which he had not the shadow of a claim. She threw a look at Percy as her partner led her away, which was the severest punishment she could inflict on the man who ardently loved her.

The third dance stood in the programme as a waltz. In jealous distrust of Percy, the captain took the conductor aside, and used his authority as committee-man to substitute another dance. He had no sooner turned his back on the orchestra than the wife of the colonel of the regiment, who had heard him, spoke to the conductor in her turn, and insisted on the original programme being retained. "Quote the colonel's authority," said the lady, "if Captain Bervie ventures to object." In the mean time the captain (on his way to rejoin Charlotte) was met by one of his brother officers, who summoned him to an impending debate of the committee charged with the administrative arrangements of the supper table.

"Surely they can do without me?" Arthur suggested.

"No," said the officer. "In case of any difference of opinion, the colonel requests that all the committee will attend."

Under these circumstances, Arthur had no alternative but to follow his brother officer to the committee-room. Barely a minute later, the conductor appeared at his desk, and the first notes of the music rose low and plaintive, introducing the third dance.

"Percy, my boy!" cried the major, recognizing the melody, "you're in luck's way—it's going to be a waltz!"

Almost as he spoke, the low, plaintive notes glided by subtle modulations into the inspiring air of the waltz. Percy claimed his partner's hand. Miss Charlotte hesitated, and looked at her mother.

"Surely you waltz?" said Percy.

"I have learned to waltz," she answered, modestly; "but this is such a large room, Sir, and there are so many people."

"Once round," Percy pleaded; "only once round."

She looked again at her mother; her foot was keeping time with the music, under her dress; her heart was beating with a delicious excitement. Kind-hearted Mrs. Bowmore smiled and said, "Once round, my dear, as Mr. Linwood suggests."

In another moment Percy's arm took possession of her waist, and they were away on the wings of the waltz! Could words describe, could thought realize, the exquisite enjoyment of the dance? Enjoyment? It was more—it was an epoch in Charlotte's life—it was the first time she had waltzed with a man. What a difference between the fervent clasp of Percy's arm and the cold, formal contact of the mistress who had taught her! How brightly his eyes looked down into hers, admiring her with such a tender restraint that there could surely be no harm in looking up at him now and then in return. Round and round they glided, absorbed in the music and in themselves. Occasionally her bosom just touched his, at those critical moments when she was most in need of support. At other intervals she almost let her head sink on his shoulder in trying to hide from him the smile which acknowledged his admiration too boldly. "Once round," Percy had suggested; "once round," her mother had said. They had been twenty, thirty, forty times round; they had never stopped to rest like the other dancers; they had had the eyes of the whole room on them—including the eyes of Captain Bervie—without knowing it; her delicately pale complexion had changed to rosy red; the neat arrangement of her hair had become disturbed; her bosom was rising and falling faster and faster in the effort to breathe—before the fatigue and the heat overpowered her at last, and forced her to say to him, faintly, "I'm very sorry—I can't dance any more."
